The Molloy article comes at an opportune time. For a major fight is brewing in Congress over whether the American people shall have the right to know the identity of persons who are accepting Federal relief funds, or whether these names shall continue to be hidden in secret rolls, known only to the politicians and case workers.

Present Federal law prohibits Federal relief moneys from going to any State that permits the publication of these lists. Indiana has permitted this publication, and in July Federal Security Administrator Oscar Ewing cut that State off from Federal funds. Illinois funds are also in danger, since its legislature also voted to make public the rolls. Thus States which sought to discourage the racketeers are being penalized by the Federal Government. What does this mean to the American taxpayer?

It means that at the present time President Truman is asking for a public welfare budget of one and one-third billion dollars. This is three times the average annual amounts spent from 1943 to 1947 and is requested at a time of full employment and record national income.

The issue is fundamental. For the first time in history people are taking money from the Federal and State treasuries under the legalized cloak of secrecy. The taxpayer is not permitted to know who is getting his money. Women are making a racket of bringing illegitimate children into the world, for if the children are sufficiently starved and neglected the mother can enjoy a free and comfortable living. People who can work are refusing to work. Unworthy people are on the rolls with the connivance of fiscally politicians or through the inefficiency of lazy case workers. All this is being done in the name of social welfare.

Worst of all, we are encouraging the breeding of large numbers of low-powered and defective human beings. While these flourish the citizen who pays his own way is burdened with steadily increasing taxes. He may decide to have fewer children, because he is no longer able to educate or provide advantages for many. Thus we cut the production of children of able parents, while we cultivate the children of drones. If this continues, is there any doubt that within a generation the I Q average of Americans will start skidding?

The Oklahoma State Medical Association has long offered free medical care and hospitalization for disabled persons on the relief rolls who could be cured and returned to work. According to Dr. George Garrison, past president of the society, fewer than 5 out of 100 "disabled" relief recipients have elected to take this treatment.

No one seriously suggests that families which have suffered disaster should be denied relief funds. But it has been conclusively demonstrated that a large part of the funds voted to relieve genuine distress will be gobbled up by chiselers as long as they hide behind an iron curtain that can be pierced only by politicians and their appointees. The more relievers there are the more social workers can be given jobs. And more relievers mean more voters who will be beholden to the officeholders who got them on the rolls.

Already arrangements have been made to republish the Molloy article widely. We hope it helps stiffen the backbones of Congressmen who are now considering the folly of Federal secrecy. If this policy is not reversed, we face the certainty of a weakened America.

Rural Electrification in Iowa

EXTENSION OF REMARKS OF

HON. JAMES I. DOLLIVER

OF IOWA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. DOLLIVER. Mr. Speaker, under leave to extend my remarks in the Record, I include the following speech I delivered before the Iowa Rural Electric Cooperative Association, Des Moines, Iowa, September 19, 1951:

RURAL ELECTRIFICATION IN IOWA RURAL ELECTRIFICATION MARCHES ON

I am honored to be invited to appear at this fine meeting of the Iowa Rural Electric Cooperatives. It is pleasant to come home and see so many good friends. It was only a short time ago that the first project in Renwick, Humboldt County, Iowa, was energized

and the second REA project was established at Gowrie, Webster County, Iowa, in 1936. This plant was known as the Gowrie Rural Electric Cooperative. I am proud to acknowledge that I had a little to do with getting this project under way—as its attorney.

What a challenging experience. An endless amount of time was consumed in applying for the loan and going through the hundred-and-one details necessary in order to perfect it. Naturally we became discouraged. Yet looking back at it, maybe we were a little impatient. Here was something entirely new established for the first time in our county. We started from the ground up.

The best indication, however, that the foundation of rural electrification was laid well can readily be seen by looking at its magnificent accomplishments today.

Think for a moment what has been done. Here we have all the blessings and conveniences of electricity. No one need tell you what that means. Back-breaking drudgery is gone. Long hours of endless labor from sunup to sundown have been replaced by a new magic servant—electricity.

THE UNTOLD BENEFITS OF ELECTRICITY

I have seen and heard again and again what it has meant in our Iowa households since the electric switch was turned on for the first time. This was the beginning of a new era in farm life. As this great service came into their homes after years of waiting, many rejoiced that life would be made much more enjoyable.

But with all its importance, rural electrification is not without its humor and I'd like to tell you the story of our good friend, Anton Holmer. For a long time, like many of the rest of you, Anton was without electricity on his farm. Then one day, the benefits of this great magic servant came to Mr. Holmer. He was a man who had imagination. So what did he do? When he got electricity, he put a radio out in his barn so he could have music as he pulled the cows' teats—and presto—the cows immediately gave more milk. Or at least that's what Anton said.

But most of you are concerned with the hard drudgery of farm labor without this ingenious tool of electricity. I am sure that the case of Mr. and Mrs. Ralph Denger in Wright County could be duplicated by any of you in your homes today. Nevertheless, it is well for us to recall that when the Dengers got their electricity not too many months ago, there was great joy and happiness in their farmstead. Overnight, it became a modern home. No longer did they have to carry water in back-breaking drudgery. Now every convenience of a city home is theirs on their farm near Dows. Mr. Denger's comment certainly was a true one when he said, "This is the most wonderful thing I have known for this farm."

A HIGHLY TECHNICAL THING

If someone had said many years ago that farmers could operate their own electric systems and hire the necessary technical help, he would have been laughed at. Yet look at the cold facts of the operation of our highly successful project.

Electricity is easily one of the most complicated things in modern life. A high degree of specialized training and very complicated skill is essential in order to operate these systems. Yet the plain fact of the matter is, the farmers of Iowa have done an outstanding job in making this very complicated tool their handy and useful servant. Truly, we have shown by actual accomplishment what can be done when there is a will and determination to put it over. We have had the wisdom to secure competent engineering guidance, and many a farmer has himself become a competent electric specialist.

This is a good time to take stock of the magnificent success that our people of Iowa have accomplished in rural electrification in the last 16 years. When our rural-electricity program began in this State in 1935, only 14 percent of our farms were receiving the benefits of central station electric service. In 1935 only 32,047 farms in Iowa had such service. And what is our record today?

IOWA'S ACHIEVEMENT IN RURAL ELECTRIFICATION

The last summary available to me was for April 1, 1950. At that time 90.8 percent of our Iowa farms, or 184,109, were receiving central-station electric service. That was an increase from 14 percent in 1935 to nearly 91 percent. And by now I have no doubt the percentage exceeds 95.

This is no accident. It is a perfect example of how we can do things for ourselves. When the opportunity and the tools are available our people make good. Iowa's remarkable record in rural electrification proves conclusively what I mean.

They say that eternal vigilance is the price of liberty. We must guard the things we have won if we are to preserve our present gains. Among people like ourselves, all that is necessary is to know clearly how we reached our present goal and what should be done to preserve our gains. Therefore, let us review the record of great achievement before we ask ourselves: "Where do we go from here?"

THE BIRTH OF REA

As you know, REA was born in 1935. This great institution came into existence under unusual circumstances. The first funds to promote this program came out of a Federal relief act. Farms needed power. Workers needed jobs. By Executive order, REA was created to do both.

It was soon seen that rural electrification was a big job and could only be done by careful planning over a long period of years. Accordingly Congress supplanted the Executive order of 1935 and passed the Rural Electrification Act in 1936. This congressional law set up a long-term development program, implemented by later legislation.

At this time, the cost of erecting power lines was extremely high. According to the Federal Power Commission survey when REA was established, it cost nearly \$2,000 to build a mile of rural line. Consequently, the first big job confronting REA was to build good power lines that would make possible the rendering of electric service at a price people could afford to pay. Before long that very thing was accomplished. By careful and skillful engineering a new kind of construction was developed to meet the exact needs of rural electrification. REA cut previous costs nearly in half. Instead of \$2,000 for a mile of line, costs went down to about \$1,000 a mile of line, and sometimes, considerably less than that.

RECENT REA ACCOMPLISHMENTS IN IOWA

The first REA loan in Iowa was approved in September 1935, and the first REA-financed line was placed in operation on December 15, 1935, by the Central Iowa Power Co. of Des Moines.

Up to July 1, 1951, REA had approved \$117,041,340 in loans in Iowa to 55 borrowers, 53 of them cooperatives. The loans enable these borrowers to finance the construction of 55,979 miles of line and other rural electric facilities to serve 135,354 rural consumers. Some of these facilities already are in operation, and additional lines are being built as rapidly as possible.

By July 1, 1951, REA had advanced \$98,143,152 as loans in Iowa, and as of June 1, 1951, the State's borrowers were operating 52,638 miles of line serving 131,443 farms and other rural consumers. From these figures, it's apparent to me that considerable work is under way right now to complete Iowa's rural electrification.

CONSUMPTION OF ELECTRICITY IN IOWA

The average monthly farm consumption on REA-financed lines in Iowa increased from 79 kilowatt hours in December 1941, to 288 kilowatt-hours in December 1950, nearly a four-fold increase. This increase reflects greater use of electrical equipment to save time and labor in performing farm and household tasks to bring about a more comfortable way of rural living. In the same period the national average went from 61 kilowatt hours to 161 kilowatt hours per farm, less than a threefold increase. You see Iowa farmers enjoy and appreciate electricity a bit more than others.

WHAT IOWA BORROWERS HAVE PAID

The latest REA debt-service summary, covering all transactions to April 1, 1951, shows that the Iowa borrowers have paid \$15,954,959 in principal and interest on their Government loans. This includes \$2,540,884 paid on principal in advance of the date due. Thirty-nine borrowers were ahead on their payments, and not one was delinquent.

Truly, this is a remarkable record. Borrowers of the State of Iowa are thus not only ahead on the payments, but also their credit record is entirely in the clear. We are justly proud of this. No wonder the Congress considers Iowa rural electric cooperatives sound credit risks.

ATTEMPTING TO SERVE AN ENTIRE AREA

After the establishment of the rural REA projects the next important step was the process of developing sound, well managed local REA cooperatives. It did not take too long to learn that job. The outstanding financial success today is ample tribute to how well it was done.

One remarkable thing about rural electrification is the principle of area coverage. This means serving everyone, and not the lucky few. Unlike rural electrification in the old days when power lines only went down the main highways and omitted most farmsteads on secondary roads, REA systems cover the entire area. The big and small, the rich and the poor, the owner and the tenant, all these have the benefit of the sound engineering program of the REA and the blessings of electricity.

LOWERING WHOLESALE RATES

The next big job that confronted Iowa co-ops at the outset was how to get rural electricity at a price people could afford to pay. In the old days, in other States, wholesale rates of 2 and 3 cents a kilowatt-hour were common. Iowa was more fortunate in this regard. Rates of 2 cents per kilowatt-hour or 17 were not uncommonly quoted for Iowa projects, as the REA co-ops were getting under way.

Now compare those rates with the steady drop since 1940, when the average cost of power purchased by Iowa borrowers from private suppliers was 1.26 cents per kilowatt-hour, average. In 1950, this rate had dropped to an average of 1.10 cents per kilowatt-hour. If the old high wholesale rates had continued, there would be no big rural electrification program today. Such high wholesale rates would have made the retail rates so high as to restrict the wide-scale use of electricity. So here again the cooperatives and the REA developed a sound program of wholesale power rates which soon brought down the higher rates that had been in existence previously. As a result retail rates dropped markedly. New sources of power were developed and the utilities fell in line. The result is, that rural electric service has been the cheap and willing servant of all Iowa farmers.

THE WIDESPREAD USES OF ELECTRICITY

When rural electrification service was first introduced on our farms, people merely thought of using it for light. But once electricity became available, its endless uses on

the farm manifested themselves immediately. Electricity is useful in town. It is even more useful on the farm. Factories showed the way here. Machines, which were formerly driven by steam or operated by hand, were converted to electricity. Mass-production methods were pioneered by its use. Farmers soon learned that they, too, could use these same methods, in modified form, to serve their particular needs.

From pumping water to grinding feed, electric motors became the real servant upon the farm. Cooling milk, hot beds for spring seedlings, drying hay, pumping water for stock and poultry, electric chick brooders, elevators for grain, are just a few of the many uses of electricity. Electric-milking machines and separators, ditch irrigation, running water for livestock, water tanks, elevators, electric corn shuckers, grinders, ensilage cutters, these are other samples of the hundreds of ways in which farmers, helped by electric specialists and by their own resourcefulness, put electricity to work to save time and labor. And at the same time obtain new sources of income. It is not unusual to find a dozen or more motor-driven, labor-saving devices on a farm.

When an electric line is built out to a farm, a completely different tool is made available to the family which lives and works there. Most farm tools have only one or a few uses. Electricity as a tool, however, has hundreds of uses on the farm and in the home, and more are being discovered and used every day.

In the poultry-raising areas, as you know, running water from electric pumps and electric poultry house lights are all important. In the brooding houses, all-night lighting to prevent crowding cut mortality to practically zero. Quick-freeze cabinets handle thousands of pounds of poultry at a time. An electric milker does the work of many people. There is no need for me to go on.

REACHING THE REST OF IOWA

We can take justifiable pride in our great rural-electrification accomplishment in Iowa. For truly a jump from 14 percent to 91 percent of all our farms having the benefits of high-line electric service is a remarkable record.

The mere statement of that achievement, however, shows the job that lies ahead, namely, reaching that other percent who do not enjoy the blessings of electricity at present.

We all know that there are many fine Iowa citizens who have been waiting patiently for a long time, and still do not have the benefits of electric service. In some cases, their patience is worn rather thin with delays, which, although explained, are a poor substitute for electric service. They, too, are just as anxious as anyone—before his farm received electricity—to obtain such service at the earliest possible date.

I know how diligently cooperatives are working to obtain the necessary funds and materials for extensions or new developments to make this service possible. For my part, I want to pledge to you every aid that is in my power to complete this big job before us.

With all of the background we have had, we will find ways and means of reaching these unserved rural people. If other States are approaching 100 percent in rural electrification, we will not be satisfied with anything less in Iowa.

WHAT LIES AHEAD?

The question that presents itself to all of us is, "What lies ahead?" From the vast experience had in developing sound rural electric cooperatives, there should be no question in our minds as to what the future holds in store. We have forgotten many individual difficulties and differences and have

molded our rich experiences together into a friendly and forward-looking effort. The result is that Iowa and the rest of the country are richer. As long as we all work together for the common good, there is little need to worry about the future.

It takes no imagination to realize that this great electric revolution of the farm is just beginning. It has tremendous appeal and opportunity, not only for the present generation but also for the youth who will be the rural citizens of tomorrow. Many farm boys and girls have inspired their elders to try new ways of farming and have introduced new uses for electricity.

The potentialities of electricity for heat, light, and power application are only beginning to be grasped by the majority of American farmers. As the cost of power goes down, and as farm people realize more fully what electricity can do for them, it will be applied in endless ways to make better living and more comforts in the home and on the farm.

DIFFICULTIES IN DEVELOPMENT OF REA COOPERATIVES

Today one of our problems is the utilization of electricity by REA co-ops in Iowa of the power to be produced at the Randall Dam and others, on the Missouri River in South Dakota. There is no difference of opinion among us that Iowa REA's should have their share of the benefit. But there has been some difference of opinion as to how, and by what method it should be used. Unfortunately, some rancor has developed among a few, which I sincerely hope will not be the pattern for all of us. There is no need to become heated or angry about a proposition that must be solved, not by emotion but by practical realities.

What are these realities? They are political, economic, and engineering realities. What is the present political reality? Let me quote the policy laid down by Congress as to distribution of electric energy.

"Where private utilities and/or REA and/or municipal plants have existing adequate transmission facilities, or where they agree to build same, and will enter or have entered into a wheeling contract to wheel Federal hydropower to preferred customers and other power users in line with such contracts as already exist in many areas, then the taxpayers' money should not be spent to build transmission lines." The Congress has sustained this policy on several occasions.

The economic reality that will govern is the answer to the questions—What method of distribution will be cheapest and best in the long run for Iowa farm consumers, and should Iowa cooperatives continue to control the distribution of the electric current they sell?

The engineering reality is one which we must necessarily submit to competent electrical engineers who are expert in their field and are practiced in the science of electric transmission. They will know the best kind of method from an engineering standpoint.

Surely a calm and reasonable consideration of these realities, uninfluenced by our emotions and prejudgments will evolve an answer to such difference of opinion as may exist.

Because before this there have been differences. A long and stony road was traversed before our splendid present REA cooperatives were established. It is instructive to remember some of the major battles that were fought, in order to shed light on problems that now seem as large and difficult and bitter today. For it must be remembered that in the early days, as well as when REA developed, each one of these controversies—and some of them were very bitter ones, as many of you recall clearly—were

the stuff out of which the present splendid cooperatives were established.

First consider the whole REA job. When this program was first started, few people dreamed that new, fledgling cooperatives could succeed in covering whole areas. Yet, over a period of time the good and the bad were mingled together and out of it our present fine system evolved.

Consider all the engineering obstacles that were surmounted and successfully overcome. We have mentioned previously the early titanic problem of wholesale rates. And so, too, the endless other difficulties that presented themselves from time to time.

At times many of us got pretty hot under the collar and yet, look at the results today in solid achievement.

The history of the overcoming of these obstacles is very important. Whenever real difficulties beset our communities, it is proper and in accordance with the best tradition of the American way of life, to discuss them fully and frankly. However, we should use the ancient maxim of "disagreeing without being disagreeable."

In the long run, cooler heads and wise counsels prevail if all of us "just keep our shirts on." No man in advance knows the answer to these tremendously difficult problems. But one thing is certain. If we have an open and vigorous and free discussion, so that there is a "competition of truth on the marketplace"—to quote the late Justice of the Supreme Court, Oliver Wendell Holmes, the best policies and practices of our State are bound to prevail.

WHAT REA HAS DONE IN THE UNITED STATES

It is refreshing to look over the entire REA program to see what the farmers and the people of rural America have done for themselves since REA was established in 1935. Here is the record.

By July 1, 1951, REA had approved \$2,427,204,114 in loans to 1,076 borrowers. They include 986 cooperatives, 41 public power districts, 24 other public bodies, and 25 commercial power companies. At that time, REA had on file or in process in the field, additional loan applications totaling \$322,850,000 for new system construction and various line improvements. Most of these applications are for expansion of existing systems financed by REA.

Over 1,000 of these REA borrowers now have rural electric facilities in operation. Their facilities include more than 1,100,000 miles of line serving about 3,500,000 farms and other rural consumers in about 2,600 counties of 46 States, Alaska, and the Virgin Islands. Additional lines are being built more rapidly now than ever before, to reach the less accessible places.

Of all the loans thus far approved by REA, over 80 percent have been for electric-distribution facilities. REA makes generation and transmission loans when borrowers are unable to purchase an adequate supply of power or when saving would result. Approximately 18 percent of the REA loans have been for construction of generating plants and transmission lines. About 1 percent of the loans have been made to power-system operators for relending to their consumers to finance installation of wiring, plumbing, fixtures, electrical equipment, and appliances, and irrigation facilities. The pattern of power production, distribution, and use is by no means uniform over the entire Nation. The important thing is to produce the juice for use in a way beneficial to those who need it.

As citizens of Iowa we have a right to be truly proud of this magnificent accomplishment. Proud of the entire rural electrification program. For truly, we are a vital and integral part of this stupendous achievement. All America, and the world, is now taking cognizance of this splendid addition to our rural farm culture.

Politics in the Post Office

EXTENSION OF REMARKS

OF

HON. GEORGE MEADER

OF MICHIGAN

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. MEADER. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following letter:

SEPTEMBER 25, 1951.

HON. CLYDE R. HOEY,
Senate Office Building,
Washington, D. C.

DEAR SENATOR HOEY: I wish to join in the request of Senator FERGUSON that the committee of which you are chairman conduct an investigation of the solicitation of political contributions from applicants for positions in the post office in the State of Michigan.

As you will observe from my remarks in the CONGRESSIONAL RECORD of Thursday, September 20, 1951 (A5751-5752), the investigation which I believe should be made is somewhat broader in scope than that requested by Senator FERGUSON. However, this narrower subject is included within the broader one and would seem to me to be a logical first step.

I also wish to assure you of my cooperation in every respect in the conduct of such an investigation should your committee decide to undertake it.

I am transmitting to you herewith certain correspondence received by me on a confidential basis and other material. I trust that such of the correspondence as was transmitted to me in confidence will be received on that basis by your committee. In addition to this material I have received other information in the nature of leads which I would be glad to pass on to your investigators if they will contact me.

I only wish to add that I have followed the work of your committee in connection with the Mississippi job sales and your current hearings on Reconstruction Finance Corporation loans and wish to commend you for the forthright, impartial, and thorough manner in which those investigations have been and are being conducted.

Sincerely,

GEORGE MEADER

Flood Plan Is Another Socialistic Scheme

EXTENSION OF REMARKS

OF

HON. RALPH HARVEY

OF INDIANA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. HARVEY. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following editorial from the Greensburg (Ind.) Daily News of September 19, 1951:

FLOOD PLAN IS ANOTHER SOCIALISTIC SCHEME

A radical departure from traditional American programs in aiding victims of disasters is contained in the proposal of President Truman for spending \$400,000,000 for relief and rehabilitation in Kansas, Missouri, and other stricken States.

Mr. Truman endeavors to justify the plan on the ground that the Nation is aiding peo-

ples in other lands and that quick rehabilitation is needed because of the defense effort.

In the past the American Red Cross has assumed the major role in helping victims recover from their losses. Those who needed help were given it to the extent that their basic requirements—food, shelter, clothing, and household furnishings—were supplied. Those who could help themselves did so.

Under the President's plan, the criterion of need would be abandoned. The Federal Government would indemnify everybody, except the larger commercial and industrial enterprises, for losses, regardless of needs.

This kind of indemnification program was set up in Canada after the disastrous floods in Winnipeg last year. Mr. Truman's plan is the first move in this direction in the United States.

While the President's proposal is pending before Congress, the Red Cross has gone forward with its traditional disaster relief and rehabilitation program.

It has been active in the valleys of the Kansas and Missouri Rivers since the second week in July when the floods struck. A campaign has been launched to raise \$10,000,000 for relief and reconstruction. It already has committed and is disbursing \$2,000,000.

In the disastrous Ohio River flood in 1937 the American Red Cross collected voluntary donations and gave assistance of some type to 236,000 families. It cost the Red Cross \$25,000,000, which would be equal to twice that amount now. Over \$7,000 was subscribed for Red Cross flood relief in Decatur county alone.

The Federal Government already has made a grant of \$25,000,000 for rehabilitation in the Kansas-Missouri area from a fund that was not available in 1937.

Most of this has now been allocated and much has been disbursed to pay for clearing away debris, restoring water and sewer systems, repairing highways, and rehabilitating schools and other public facilities. Only a small portion of it has been earmarked for relief of individuals.

The Reconstruction Finance Corporation also has been active in the flood area. Nine temporary offices have been opened through the area to process applications for RFC loans to rebuild houses and reestablish small businesses. More than 1,500 applications have been received for loans totaling \$15,000,000.

By the middle of last week the RFC had approved 449 loans for \$3,080,000. The Federal Housing Administration, the Veterans' Administration, and other lending agencies also are extending Government credit to the flood victims.

In short, the flood victims in Missouri, Kansas, Illinois, and Oklahoma are receiving far more help and greater credit assistance than those who experienced the Ohio River flood in 1937 and the disaster is not nearly so far reaching. If the need is as great as indicated by Mr. Truman, the Federal loaning facilities could be easily expanded or loans of private institutions could be underwritten.

The proposal for an expenditure of \$400,000,000 for the area would set a precedent which would prove very dangerous for several reasons.

1. It would mean that the Government would be required to aid financially in every future disaster.

2. It would result in abandonment of the principle of definite need as the basis of aid and would tender assistance to individuals that are able to help themselves.

3. It would mean that the Federal Government would, in large part, supersede the American Red Cross as the agency for dispensing flood and disaster relief.

4. It would place disaster relief in a status that political manipulation would be easily achieved.

5. It would represent another gain in the program of socialization of the United States which the bureaucrats at Washington are seeking to foist upon the American people.

A timely move would be the organization of a system of flood and disaster insurance by private insurance companies of the Nation. It might be possible for the Government to give some financial support to the program or extend some guarantees until the program has gained a firm financial status. Then the companies should operate independently and should charge on the basis of experience tables and anticipated losses.

Citizens of the United States want to tender all necessary assistance to the unfortunate people in the four flood-stricken States. But they do not regard it necessary to abandon traditional American principles relating to disaster relief in the interest of state socialism.

Oklahoma Farm Bureau President Insists That Relief Rolls Be Protected but Open for Public Inspection

EXTENSION OF REMARKS

OF

HON. GEORGE B. SCHWABE

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. SCHWABE. Mr. Speaker, some days ago I received a letter from Mr. John I. Taylor, president of the Oklahoma Farm Bureau, dated September 7, 1951, in which he insisted that the relief rolls be protected but kept open for public inspection.

The recent article appearing in the Saturday Evening Post of September 8, 1951, entitled "The Relief Chiselers Are Stealing Us Blind," dealt with investigations and research of only one phase of the relief program. It dealt with that portion of public relief which involves appropriations and expenditures for aid to dependent children. The revelations in that article are shocking and show a disgraceful situation, which is more or less nation wide.

However I dare say that a proper investigation of conditions would reveal other startling facts with reference to the abuses in the field of old-age assistance program and general relief, which come under the public assistance programs and for which Congress and the States appropriate huge sums of money annually.

In my humble opinion, the real basis of these abuses and the impositions by those who have taken unfair advantage of the generosity of the public may be found in the fact that there has been an inclination to make a political football out of the relief programs. It has afforded an opportunity for a lot of political hangers-on to get jobs at the expense of the taxpayers. We are all too familiar with the tremendous overhead expense of administering these programs. Those who possess political influence have in many instances obtained appointments for members of their family, relatives, or friends, regardless of whether or not they were competent. Many case workers have turned

out to be veritable political snoopers. In most instances, the case workers have been conscientious, but in too many instances, they have allowed political pressure to influence their actions, or it has influenced that of their superiors. In many instances, the oldsters could perform the duties of case workers and fill positions of others who administer these programs, which would take that many off the relief rolls immediately.

Apparently the Oklahoma Farm Bureau, through its President, expresses its belief that the relief rolls should be opened for public inspection, in order that it may be determined who, if anyone, is on these rolls improperly. At the same time, Mr. Taylor would have the law protect these rolls from all improper uses, and I think that could be done. Opening the rolls for public inspection may not be the best approach to the solution of the evils that have developed in the administration of the relief programs, but it certainly is one that challenges the best thinking of which we are capable. Some State legislatures have already taken action in this direction, and I believe that we will witness a salutary result in those States. If there are other approaches, they should receive the careful attention of the Congress, and of all who are interested in this program.

The Oklahoma Farm Bureau president's letter follows:

THE OKLAHOMA FARM BUREAU,
Oklahoma City, September 7, 1951.
HON. GEORGE SCHWARTZ,
Member of Congress,
House Office Building,
Washington, D. C.

MY DEAR CONGRESSMAN: Recently I received from a Member of Congress a mimeographed statement on reasons why the existing Social Security Act provides that public assistance records be kept confidential.

In reviewing this document, the main contention is that if these rolls were made public, they would be used by business concerns and politicians to further their own ends. In connection with these reasons, is there any reason why the Congress could not insert into the law a very stringent penalty for the use of these rolls by anyone? This penalty should be made severe enough that it would not be violated.

It is still our opinion that these matters will never be cleaned up on a State basis even though the State has full authority to accept or reject any applicant for assistance. This is a national matter involving the expenditure of Federal funds and should be open to public scrutiny. We do not believe that the reasons stated in this document will stand the light of day, nor do we believe that public assistance rolls will be cleaned up of undeserving persons until they are opened to the light of day.

We continue, therefore, to insist and urge that you lend your best efforts to enacting into law such provisions as will protect these rolls and at the same time that they will be open for public inspection.

A recent article in the Saturday Evening Post is a shame and disgrace to the State of Oklahoma and doubtless could be carried to many other States of this Nation. We believe the solution of this whole problem lies in this suggested approach. We respectfully urge that you take appropriate action.

Very truly yours,

JOHN I. TAYLOR,
President.

The Present Opportunity of a Governmental Employee

EXTENSION OF REMARKS

OF

HON. WALTER M. MUMMA

OF PENNSYLVANIA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. MUMMA. Mr. Speaker, as other Members of Congress I received considerable mail from the classified civil-service employees of the Government in relation to their increased compensation.

In acknowledging this I considered it a favorable opportunity to make a closer contact with these employees, and in turn to have them feel a more emphatic tie-up with the problems we as Congressmen are confronted with in Washington.

In doing this, as the letter shows, I endeavor to impress upon their minds the result on our economy of these tremendous appropriations at home and abroad, and the inevitable taxes that will follow. And so on through the other points of the letter as a reading will show.

These cards were from a very small percentage compared to the number of governmental employees in my district. I felt the CONGRESSIONAL RECORD would afford a greater number of them an opportunity of getting a congressional viewpoint, not only in my own district but others as well.

The letter is as follows:

CONGRESS OF THE UNITED STATES,
HOUSE OF REPRESENTATIVES,
Washington, D. C., September 22, 1951.

DEAR FRIEND: Thank you for your card advising me of your feelings concerning the increase in salary for classified rated governmental employees.

From the newspapers and radio you are aware that the legislation in which you are interested was passed by the House and now will go to the Senate-House conference. Here minor differences in the viewpoints between the two bodies will be adjusted. The bill contained a retroactive clause which sets July 1, 1951, as the effective date of the increase. Any delay in final action will not be of financial loss to you.

Now, may I say a few words to you.

Our governmental employees cannot help but be aware of the terrific appropriations to activities not only at home but throughout the world. These funds all come out of our pocketbooks whether directly or indirectly. They are all inflationary. Personally, I am for keeping them at an absolute minimum—national safety alone being considered.

Maybe we can do something in a concerted action to stabilize prices at present levels if we take every precaution not to create artificial demands on items of which there are either real or apparent shortages. Such situations when started go like forest fires. Merchandise does seem to be in good supply judging from sales advertisements and shop window displays. As for food, meat seems the most unsteady and unpredictable. However, if we prevent unusual demand, it will ease off.

Avoiding inflation should be our constant effort. You as a governmental employee can help. You are the one who should be a sales person for these contributions to real Americanism. No one wants to return to the material standards of the horse and buggy

and 14-cent egg days, but there has been nothing yet evolved to replace our old ideas and practices of honesty in thought, word, and deed. These are basic and of highest concern today. In our everyday lives we should endeavor to strive to keep America great, to stand firm against those who would destroy the things we have had preserved for us and wish to pass on to the children of today.

Now the legislation of the Congress on your salary may not be ideal in your every wish. Congress feels it has made a good over-all step, and I sincerely hope that this is your feeling. Will you kindly accept my few words on our current situation as—not a lecture to you—but a desire for you as a fellow governmental employee to accept leadership in the things that mean so much to us. In this connection we must also watch our application to everyday duties so that those who are helping to pay our salaries will feel that we are constantly endeavoring to do a good job in whatever our task in governmental service may be.

Thank you again for writing to me.

Sincerely,

Your Congressman,

WALTER M. MUMMA,
Member of Congress.

Has Anyone Thought About Slowing Down This Spree?

EXTENSION OF REMARKS

OF

HON. RALPH HARVEY

OF INDIANA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. HARVEY. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following editorial from the Shelbyville (Ind.) News for September 21, 1951:

HAS ANYONE THOUGHT ABOUT SLOWING DOWN THIS SPREE?

In spite of the fact that, according to Government officials themselves, we are close nationally to a shortage of manpower, the Federal Government is hiring more and more civilian employees.

The very fact that we may be short of workers when the defense program hits its full stride appears to have inspired a number of United States bureau heads with a zeal for "stockpiling" several thousand employees every week. The last total we saw was 2,489,500 civilians on the Federal payroll with new hiring progressing at the rate of 1,500 per day.

And it's the same with plans for civil works projects, some of which may get a face lifting to make them appear to be military projects. It seems that bureaucrats want to obligate the Government for more than a billion dollars to build "plants and facilities for war production purposes." This in spite of the fact that private industry declares that it is fully capable of handling much more than present war production.

There is no doubt that pay-as-we-go taxation to keep the national debt from swamping the entire national economy would be far easier if the bureaucrats would abandon such schemes that smack too much of socialism for the appetite of a majority of thinking American citizens.

While national administration leaders are clamoring for more controls to halt spiraling inflation the Government itself is hiring in too many instances two and three employees

for one-man jobs and, at the same time, pricing private industry out of the labor market. To most Americans, this sort of thing just simply doesn't make good, hard sense.

But of one thing we may be sure. This merry-go-round won't stop until the American public demands it. The only way to demand it is to tell Congress through our elected Representatives and Senators.

A great deal has been and is being said by national leaders regarding the necessity for making the country strong to resist the enemies of freedom. We're for that, and we believe practically all other good Americans are for that, too. But we can't increase our strength by putting more people on the Federal payroll than are absolutely needed. One man for one job is enough.

Know Your Waterways—Informing the Public

EXTENSION OF REMARKS OF

HON. HENRY D. LARCADE, JR.

OF LOUISIANA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. LARCADE. Mr. Speaker, under authority granted to extend my remarks in the Appendix of the RECORD, I wish to submit an article by the Marine News, of New York, N. Y., which was published in the Washington Post, as follows:

Know Your Waterways—Informing the Public

We are certain that less is known about the Federal waterway system than about any other great asset of the Nation. As the outstanding publication in the marine field, with more than 11,000 circulation, we believe that we can serve no more useful or patriotic purpose than keeping to the front the genuine necessity for constantly improving and extending the Nation's waterways, both in the interest of economical transportation and national defense. Publicizing our waterways cannot be left to hostile, selfish interests. Unless such propaganda and misinformation are refuted and constructive facts made known beneficial waterway development will be delayed and existing facilities will not be used to the limit of their capacity. The loss will fall on the public. It is incredible how little is known, even among many well-informed, about the benefits that come to the people through their waterways. Picture the helplessness of the Nation should all harbors and channels vanish overnight. It would be a mortal blow to much of the Nation's defense, industry, and commerce.

Chicago Tribune Again Blasts \$19,019,000 Hand-out to Grandview, Mo., Airport

EXTENSION OF REMARKS OF

HON. H. R. GROSS

OF IOWA

IN THE HOUSE OF REPRESENTATIVES

Monday, September 24, 1951

Mr. GROSS. Mr. Speaker, I am placing in the RECORD herewith another editorial from the Chicago Tribune protesting the \$19,019,000 authorization to the cow-pasture airport at Grandview, Mo., balliwick of the Truman family and political insiders, including the late Boss Pendergast.

I have protested this shoddy deal from the beginning, and will continue to protest it.

This is the second editorial on this subject called to my attention in the Chicago Tribune, and is in addition to the many editorials from Iowa and elsewhere that I inserted in the RECORD August 20 and September 13.

Please notice that although the appropriation for the \$19,019,000 authorization has not yet been enacted, the boom is already under way for the benefit of at least one machine politician with an inside track.

The editorial from the Tribune follows:

CASHING IN

A reader sends us a brief report from the Kansas City Star of September 11, stating, "The purchase of 80 acres of land just outside the city limits of Grandview for the development of a business section and the construction of 245 residences was disclosed today by Knos A. Axtell, lawyer, who represented the buyer and seller in the transaction." The purchaser is listed as Frank Morrell Construction Co., of Scarsdale, N. Y., and Washington.

The story notes that the reported price of \$500 an acre represented a sharp increase over prices in previous land acquisitions.

Grandview, Mo., is the site of Mr. Truman's old family home. The family farm of 394 acres is situated there. By something less than coincidence, Grandview turned up as the site for a \$19,000,000 military airport in the \$5,800,000,000 military construction bill approved by Congress recently. It was explained that this was an ideal situation for the headquarters of the central air defense force and Continental Air Command.

Axtell is one of Truman's political cronies. He was hand-picked by Truman to run in the crooked Democratic primary of 1948 when Truman wanted to get rid of Congressman Slaughter. Axtell owns a 320-acre ranch across from the airport site and has bought an additional 120 acres in the last 5 years. His purchase for the Morrell organization indicates that a vast development, with large increases in property values, is under way at Grandview, in which he and the Trumans will profit. Axtell has already started to cash in.

The Grandview deal is such a flagrant instance of profiteering on the strength of the Soviet menace trumpeted by Truman that it is hard to believe that anyone could be so barefaced about corruption. Nobody is likely to be surprised by all this. For our part, we called the turn in editorials of August 14 and 25. Once you catch on to the methods of this administration, as pretty nearly everybody has, you no longer stand to be surprised. They are shameless.

Rehabilitation of Flood-Stricken Areas

EXTENSION OF REMARKS OF

HON. RICHARD BOLLING

OF MISSOURI

IN THE HOUSE OF REPRESENTATIVES

Monday, September 24, 1951

Mr. BOLLING. Mr. Speaker, the editorial from the Kansas City Times of

September 19, 1951, which follows, speaks for itself:

A FLOOD PLAN HEARING AT LAST

This much is certain: The worst disaster in American experience deserves immediate and full consideration by Congress. Then let the aid question be settled on the merits of the case. That can be done only by the wholehearted cooperation of the key men in Congress.

After prolonged and costly delay a hearing now is to be started by a House appropriations subcommittee. It will be a secret hearing with the public barred. Yet we trust it will mark an effective start. From the leadership of Congress we have heard far too little to indicate an active interest. Time is running out and more delay should not be allowed to smother the voice of the Midwest.

The latest tip on the prevailing attitude comes from Representative NORRELL, of Arkansas, who was named chairman of the subcommittee to start action. NORRELL said the Government agencies had given him incomplete figures. Then he raised a preconceived objection on the grounds that an aid program would stir up demands on other past floods and set a precedent for the future.

Perhaps this statement only indicates advance caution. We hope so. Taken literally it would show critically serious unfamiliarity with the Midwestern devastation or the proposed aid program.

If this had been just another flood, nobody would have even suggested Federal aid. In his message the President was talking about a terrible disaster far beyond anything this country has known. The Red Cross or other private agencies have the resources to take good care of little flood disasters. There have been many of them in the Missouri basin without any demand on Congress. But here is a devastation measured in the billions of dollars. Compared with the resources of any private agencies the losses are astronomical. The only power great enough to cushion the economic shock and give material aid is the Federal Government.

The case checks to Congress. It is spending billions on billions around the world. It is just now starting the secret hearing for a great part of the United States that is vital to the agricultural and industrial economy of the Nation.

As for the precedent, anyone who has even read the aid bill should know that it carries its own answer for the future. Part of the proposed \$400,000,000 would go into a revolving fund to start Government underwriting of private flood insurance.

We have even heard some congressmen say that the program would commit the Government to aid on losses from every tornado or hurricane. We would think any Member of Congress would know that individuals and businesses are already protected by wind insurance. It is the normal companion of fire insurance.

So far there is no general insurance protection against the greatest hazard, which is a flood. The risk is so concentrated that private companies can't offer the protection at practical rates. American property in the tens of billions is subjected to this one risk without normal insurance protection.

The President's plan simply proposes Government underwriting which would enable the private companies to offer reasonable flood-insurance rates. Given that kind of protection the Government wouldn't have to concern itself with future aid claims. In normal years of smaller floods such a program could be expected to pay its own way. Even a rare catastrophe of the 1951 scale should not put too great a burden on a national insurance program.

Until the Government completes its flood-protection systems throughout the country there is no other practical way. It can't move the large share of the American cities

that are now taking the risk in river bottoms.

This part of the United States asks no blank check. It asks a fair hearing on the merits of the case. If this issue is smothered by stalling tactics it will be a national disgrace. Action is long overdue.

Children America Forgot

EXTENSION OF REMARKS

OF

HON. EDWARD H. JENISON

OF ILLINOIS

IN THE HOUSE OF REPRESENTATIVES

Monday, September 24, 1951

Mr. JENISON. Mr. Speaker, sacrifice is demanded, and expected, from every adult when our country finds itself at war or threatened with war. But I think everyone will agree unnecessary sacrifice should not be expected from the children. Yet the victorious war effort of World War II unquestionably took a toll of sacrifice from America's children through reduced school facilities. And in these feverish days of building up the Nation's defenses against the threat of a possible world war III, new threats exist to the proper functioning of our schools in the countless communities where workers have had to move in to take their places on the assembly lines in the defense industries or in the ranks of our Armed Forces.

In these communities, and in the communities close to military installations, schools once more are being swamped by the children of defense workers and military personnel. Planning has failed and as a result, here in the United States in the year 1951, an estimated 3,000,000 children have shockingly bad schools, if any.

The plight of these children is presented with dramatic impact in an article in the current Parents' magazine. Written by Stacy Jones, able and well informed Washington writer, it is entitled "Children America Forgot." I believe every Member of Congress will want to read it. Under permission granted by the House, I am including it in the CONGRESSIONAL RECORD, for it is a vital national problem on which Congress will want to take prompt action. The article follows:

CHILDREN AMERICA FORGOT

(By Stacy Jones)

If you were living today with your service-man husband near the Tinker Air Force Base, in Midwest City, Okla., you might be helplessly anticipating the prospect of sending your child to class in an abandoned coal bin come the beginning of this school year. If husband Fred were stationed at the Wright-Patterson Air Force Base, near Dayton, Ohio, Fred, Jr., would be learning his multiplication tables in a once-abandoned building, constructed when Ulysses S. Grant was President of the United States. In winter, in this building, heat comes courtesy of a pot-bellied stove. In any season of the year there is no plumbing at all. Whether it's June or January, each time a child wants to go to the toilet he has to cross a busy highway to get there.

If you were married to an engineer about to go to work in the H-bomb plant of the

Atomic Energy Commission, to be set on 200,000 acres along the Savannah River in South Carolina, your child would not fare any better. He might find no classroom in the countryside near the project. Although the H-bomb plant is expected to bring in at least 25,000 children of new families within the next 3 years, all the available classroom space on the development is already choked to capacity. If you and your husband found a home across the river in Richmond County, your child wouldn't be any better off as to schools, because Richmond County, already pressed by Federal personnel from Camp Gordon, from two Veterans' Administration hospitals, from an arsenal, from Clark Hill Dam, has 6,000 children without classrooms now. They are meeting in churches, on the stages of auditoriums, in private houses, and in empty storerooms.

As an atomic scientist, your husband might be ordered to Paducah, Ky., where the Atomic Energy Commission is presently constructing a \$350,000,000 gaseous diffusion plant to manufacture uranium 235. But in the area around sleepy little Paducah, the school population has been shrinking steadily for the past 10 years. Old buildings have been abandoned in favor of consolidated schools. The schools' ex-personnel has been looking for, and finding other work. Today, with the new AEC plant in the process of being built, it is true that Paducah has been shocked wide-awake. In all good faith, the town is frantically attempting to reexpand its educational facilities to meet the inevitable influx of new hordes of school-age children. But Paducah is running up again the hard wall of a complicated economic problem. The high wages of the Atomic Energy Commission itself have lured school janitors and school bus drivers and school teachers away from their old board-of-education jobs into new and much more lucrative Federal positions. (The AEC pays \$12 a day to ex-janitors whose wages, previously, had been about \$4 a day.) So next fall, Paducah, Ky.—home of this country's newest uranium 235 plant—may have inadequate school staffs and have to use temporary schoolhouses.

In many defense-affected areas the classrooms which do exist are already miserably overburdened. Many of the schools operate on half time, with two shifts of students using the same desks every day.

Luckily, this critical state of affairs is not Nation-wide. Although there are children without proper schools elsewhere, it is endemic primarily to America's defense-affected vicinities—small towns where new defense plants or military posts are being reactivated or expanded. The arrival of thousands upon thousands of defense workers and/or military personnel with families has completely flooded the schools in these communities.

But the appalling statistics of this children's crisis are a measure of its national importance: Right this minute, at least 810,000 sons and daughters in these United States are without schools. They are being packed in with the 2,200,000 other pupils who, as of now, comprise the total student population of all the defense-affected areas in the country. This means that, as a direct result of Federal activity, more than 3,000,000 American children don't have proper schools. They are children America forgot in its rush to build defense plants and army installations. Nobody knows how many more millions will be drastically affected as the Nation's defense activities continue their mushroom growth.

Who is responsible for the shameful failure of the most scientifically and culturally advanced country in the world to provide adequately for its own children's education—and so, for its own future? Last year, Congress officially accepted the responsibility. It admitted that it wasn't fair to expect communities, in which huge new defense plants were being built and communi-

ties where army camps are being expanded, to finance the construction and maintenance of additional schools needed to take care of the new, sudden influx of children. Besides gorging the schools in defense areas with more children than they can handle, the Federal Government further handicaps the very same schools in another way. When it moves into a locality with an army camp or a defense project, it removes the suddenly Government-owned land from the district's tax rolls. A congressional committee has calculated that land which the United States owns now inside America's school districts would—if the Government could be assessed for it—bring into these money-strapped communities about \$186,200,000 annually in school taxes. In its last session, Congress passed an act which provided that the Federal Government should pay its fair share in the erection of the new schools needed in the defense-affected areas throughout the country. But when appropriations time came around, Congress voted less than a tenth of the sum to which the act's formula would have entitled the country's defense-affected school districts. Even if the funds are doubled by a supplemental appropriation, almost nothing in the way of school construction can be accomplished by the beginning of the next school year.

Briefly, this is the legislative case history of the defense-affected schools' scandal. Public Law 815, the act which provides Federal aid for school construction in defense-affected areas, accepts the Government's responsibility to pay for such new schools in proportion to the number of children it forces on any given district. The appropriation of \$46,500,000 voted for this year proved to be shockingly inadequate. Under the law's formula \$350,000,000 would have been needed.

So the United States Office of Education got an assignment in arithmetic. Seven hundred and forty-eight defense-affected districts had filed applications for aid on more than 1,000 school building projects. In all, these districts asked for about \$200,000,000—or about \$150,000,000 less than the \$350,000,000 sum to which the law would entitle them. Although most of these crowded districts have already borrowed and taxed themselves to the limit, they proposed to spend, anyhow, about \$100,000,000 of their own money.

From these figures, you can calculate the pay-off. The Office of Education is over \$100,000,000 short of funds which have been requested by the distressed school districts. This department is required to allot whatever money is at its disposal in order of urgency of need. In practice, it works out so that the very worst cases get some financial aid from the Government, but the others get none at all. One harassed education official said, "I feel like a father who has 10 barefoot children, and only enough money for 2 pairs of shoes."

Actually, here is how those precious, woefully inadequate \$46,500,000 are being spent. Funds were set aside to meet the most pressing demands for new schools at military bases and \$2,500,000 went for temporary school buildings, chiefly at the Savannah River and Paducah AEC developments. This left only \$31,500,000 to fill \$200,000,000 worth of requests from 748 districts. Out of this, tentative allotments were made to 75 cases.

The President has recommended a supplemental appropriation of \$50,000,000. But even with this, the United States Office of Education would still be short \$103,000,000 of what the schools asked. At this writing, the fate of the President's recommendation is unknown.

Fortunately, the schools fare somewhat better under Public Law 874, which is aimed not at school construction, but at school

maintenance and operation in defense-affected areas. Congress appropriated \$28,500,000 for these matters, to be divided pro rata. More than 1,000 eligible districts will get about three-quarters of the money to which the law's formula entitles them. But this doesn't solve the problem of how to operate and maintain a school for whose existence Congress failed to provide.

Around the Wright-Patterson Air Force Base, where school children must cross a heavily-trafficked Ohio State highway to go to the privies, the Government not only removed taxable property from the rolls, but it also left a school bond issue standing against the remaining non-Federal property. On top of this, tax-exempt Federal housing was constructed in town, and federally owned plants were leased to private companies which were also exempted from taxation.

There is yet another legal loophole which fouls up the country's attempts to provide decent education for its defense-affected children. The law requires that a school district's application for funds be based on average daily attendance for the current year. Obviously then, a town like Paducah, which will house the AEC's new uranium 235 plant, can only helplessly anticipate the arrival of thousands of new school children in time for next term. It cannot request funds for children who will be, but are not yet, in attendance at its schools.

As the mother of a school-age boy or girl and the wife of a defense worker or a military man, you would face educational set-ups just as shameful as the ones in Paducah and the Wright-Patterson Air Base at many, many smaller camps throughout the country. The Chanute Air Force Base, for instance, is the sole business of Rantoul, Ill. Next year, school attendance will probably be eight times as large as it was in 1940. The town has long ago outgrown its schools.

Let's say your husband is an instructor in the weather school on the base. You, your husband, and your two sons rent an apartment with two bedrooms in a converted private garage in town. You have no yard and no front porch to call your own, so your boys play after school in vacant lots.

Rantoul's elementary school is, naturally, full up. So your sons travel by bus to temporary classrooms on the base. These classrooms were hastily created by putting up flimsy partitions in the hospital wards. Each room might hold 20 children in reasonable comfort. But there are 35 kids in Jimmy's room and 45 in Frank's. The partitions aren't soundproof, so the children are inevitably distracted by what goes on next door. There is practically no blackboard space. It's unbearably hot on sunny fall days.

All the children must go without outdoor recess and play because their shouts might disturb the convalescent men in the hospital buildings. There is no gymnasium or auditorium, and, therefore, no physical education or visual-aids program. Because the kids have no cafeteria either, your boys travel home again for lunch. But since they are in different classes they come and go at different times. So you prepare breakfast and lunch for them separately as a daily routine.

Moreover, you have been informed that the hospital ward classrooms are only loans from the base. In case of an epidemic, they will have to be reconverted for the use of patients within 24 hours. But, epidemic or not, the school board has been on notice that it will have to return the rooms to the base by this fall.

Rantoul and 21 other Illinois school districts which are similarly affected asked for Federal aid for schools. Rantoul was lucky. The town received more than \$1,000,000 for a new school. But Rantoul turned out to

be one of only four to get construction funds.

On the Pacific coast, with its heavy concentration of naval and Air Force bases, school conditions in defense-affected communities are as bad, if not worse. A distracted mother in Atomic City, Idaho, a hamlet near another AEC project, wrote recently to President Truman. She told him that the mothers in Atomic City had to drive their children 26 miles to a high school, 28 miles to a grade school, and 32 to a junior high. She begged him, in the name of the town, for a local school. In Roswell, N. Mex., the dilapidated school building outside Walker Air Force Base has coal stoves and outdoor toilets.

Detroit is another good—or more accurately a bad—example of a metropolitan area which has never recovered from its tremendous growth during World War II. Within 10 miles of Detroit's city hall, schools exist where wells and outside privies are used in lieu of toilet facilities.

It is inevitable that these intolerable school conditions will permanently scar the children who are suffering from them now. Earl James McGrath, United States Commissioner of Education, puts it like this: "When a child becomes 6 years old and finds no school to go to, there is no way we can repair the damage 3 or 4 years later. America's children cannot be put into educational cold storage for the duration of the emergency and then later be moved into an academic hothouse for forced growth."

Well, why doesn't Congress appropriate enough money to meet its own formula for Federal aid to schools in defense-affected areas, you may well ask? What happened to that other \$150,000,000 which Congress might have voted for school construction this year, but did not? The answer is obvious, ironical, and it could be fatal to the future of this country—unless every outraged American citizen brings the tragic case of this country's forgotten children to the attention of his home-district Congressman at once.

In the vast hurried build-up of military installations, atom-bomb projects, and industrial plants all over the country, Congress has short-changed the children in defense communities.

Congress has apparently not yet recognized that the most powerful nation in the history of the world will be only as effective in securing the peace as the minds of men can make it. The 3,000,000 children, caught now in the cultural and intellectual trap of defective schools, are the men and women of America's tomorrow. If we continue to sacrifice their schooling—the making of their minds—to expediency, we may well be sacrificing the future of this country.

Write or wire to your Congressman urging him to vote the appropriations necessary to meet the school needs of these forgotten children.

Happenings in Washington

EXTENSION OF REMARKS

OF

HON. EDWARD MARTIN

OF PENNSYLVANIA

IN THE SENATE OF THE UNITED STATES

Tuesday, September 25, 1951

Mr. MARTIN. Mr. President, I ask unanimous consent to have printed in the Appendix of the Record Program No. 50 of the series of broadcasts by me to the people of Pennsylvania entitled "Happenings in Washington." This program was broadcast on September 24, 1951

There being no objection, the matter was ordered to be printed in the Record, as follows:

HAPPENINGS IN WASHINGTON, PROGRAM No. 50

(By United States Senator EDWARD MARTIN, of Pennsylvania)

This is ED MARTIN, speaking to you from the Nation's Capital and bringing you another discussion of happenings in Washington.

There are several matters I want to discuss with you today—some of the things that people in official circles here in Washington are talking about.

But first I want to tell you one outstanding conclusion I have reached after working for nearly 3 months on the toughest job I have encountered since I came to the Senate.

As most of you know, I am a member of the Senate Finance Committee, and the job I have referred to was that of helping to write the new tax bill.

When the committee had finished its work on the bill I was convinced, more than ever before, that if we are to avoid further tax increases that will reach the point of confiscation—if we are to have the national economy from collapse—we must stop the high-speed Government spending that is now going on.

I can see no escape from national bankruptcy if we rush headlong into a spending program that will cost the taxpayers at least \$100,000,000,000 each year for the next few years.

Of course, you all know that we are going to pay more taxes next year and for some years to come.

To meet the high cost of his spending program, President Truman wanted the Nation's tax bill increased by \$10,000,000,000.

The House of Representatives, after intensive study by the Ways and Means Committee, cut the President's figure down to \$7,200,000,000.

Then the Senate Finance Committee went to work.

The economy-minded Democratic and Republican members of the committee were determined to cut the additional tax bill down to the lowest possible point, consistent with efficient service and the needs of national defense.

We cut wherever it was possible. We straightened out certain inequities in the excise taxes. We plugged up some of the loopholes to eliminate opportunities for tax evasion.

And the net result was a revised tax bill which again reduced the President's request for \$10,000,000,000 to under \$6,000,000,000.

In my opinion, that is the maximum amount that can be piled up on top of the high taxes we are now paying.

I believe it is an amount sufficient to operate the Federal Government and leave a cash surplus at the end of the current fiscal year if we apply sound common sense to Government spending.

President Truman does not agree with that conclusion. He believes that we should increase tax rates all along the line and go right on spending, because, as he said the other day, "the United States is now at the peak of its prosperity."

That was the theme of his speech at the recent cornerstone laying of the new General Accounting Office Building.

In that speech he said, in effect:

"We've got plenty of money—more than we ever had before—even though we are paying high taxes and high prices for everything we buy. Government spending is nothing to be frightened about. We can afford it, and, therefore, we can keep right on taxing and spending more and more."

We can all recall when the President had a different story to tell. We can recall his solemn warning that the American people

would have to make great sacrifices now and in the years ahead. He told us how burdensome the new taxes would be. He said the people would have to give up some of the things they normally enjoy. He called upon every citizen to tighten his belt and do without things in order to help build the Nation's defensive strength.

But that serious outlook was completely forgotten in his speech at the General Accounting Office Building.

I wonder how many of you read that speech?

It has caused a great deal of discussion, because its main purpose was to pour ridicule on those who see grave danger to the Nation unless Government spending is reduced.

The President certainly picked an odd place to make such a talk. In case you are unfamiliar with its function, the General Accounting Office audits the accounts of the various executive departments and agencies. Its new office building, one of the largest in the world, will cost more than \$25,000,000 by the time it is completed.

Stop and consider what that means.

Government has grown so big and Government spending is so enormous that it costs \$25,000,000 just to provide office space for the 12,000 people needed to audit the books and accounts of this bureaucracy.

Here, at the cornerstone laying of this testimonial to the run-away size of Government spending, the President of the United States assured the folks that his administration is keeping the financial affairs of the country sound, solvent, and well managed.

Those who do not agree with him and claim there is waste and extravagance in his administration, the President said, are just telling—and I quote his exact words—"a pack of lies."

I wonder how many of you believe that in a budget of \$70,000,000,000 that a truly careful and prudent administration could not manage to save five or six billion? Do you believe that those who try to save the taxpayers' money from waste and extravagance should be ridiculed and abused?

Well, that speech is still being talked about in Washington.

Now, let's go briefly into another thing Mr. Truman said. For one thing he said this—and I quote him directly:

"A man will go into a night club and throw away \$40 or \$50 and think nothing of it. But let him get a tax bill for \$30 and hear him scream."

Mr. Truman must be a little mixed up.

In this day of the great bureaucracy almost no one who files an income tax return pays as little as \$30. Everyone who works for a living, even the young farm hand, the young office clerk, the helper in a factory, all pay bigger direct income taxes than \$30. That, of course, is only a part of what they pay. Everyone pays a lot more than \$30 a year in the excise taxes we know about—on cigarettes, gasoline, cosmetics, electrical appliances and a long list of other things.

On top of that everyone pays a lot more than \$30 a year on still another classification—the hidden taxes which, for most American families run into hundreds of dollars each year.

Mr. Truman knows about these taxes, of course, all of them.

So when he sneers about the man who "throws away" \$50 in a night club and screams about a \$30 tax bill, he tries to make people forget that all of them, even the smallest earner, pays a lot more than that under his administration.

He didn't mention that the person who does patronize a night club occasionally must pay Mr. Truman's Treasury Department a 20-percent excise tax on the amount of his bill.

And he seemed to forget that millions of our people, who feel the pinch of high taxes

and high prices, can't afford to go to night clubs even if they wanted to.

But let me tell you this—and I talk as one who has devoted long study to the matter. No matter what Mr. Truman says when he dedicates cornerstones, there is plenty of waste in that \$70,000,000,000 budget.

Money can be saved. Money should be saved. And as long as I remain in the Senate I shall fight to save it. The money which the Federal Government takes and spends is your money, earned in the sweat of your brow. I am determined that, so far as I can prevent it, your money shall not be wasted.

One of the most objectionable conditions here in Washington is the attitude of so many bureaucrats to always soak the taxpayer.

Let me give you one example of what I mean.

The other day, while the Senate Finance Committee was in executive session working on the tax bill, we had several representatives of the Treasury Department sitting in with us.

In every instance, no matter what issue was before us, the Treasury spokesmen resolved everything for the benefit of the Government and against the taxpayer. Finally I could stand it no longer. I told one Treasury spokesman "I am tired of you giving the Government the benefit of every doubt. You forget the people are your employers. You're not the bosses; the people are the bosses. As employees I think it is your duty to resolve at least some doubts in favor of your employers, the American people."

Perhaps I shouldn't have said that in the executive session, but I could not restrain myself any longer. This attitude on the part of the bureaucrats has disturbed me gravely.

Believe me, it should make the American people angry.

If things were done differently, then the Federal departments and agencies would think of the people first. Then they would not try to spend every dollar they can get their hands on and taxes would not be pushed higher and higher.

But this happy state will never come until the American people make their views clearly and emphatically known to their representatives in Washington—both in the Congress and in the executive departments and agencies.

In the course of working on your tax bill, the very able and distinguished Senator from our neighboring State of Delaware, JOHN J. WILLIAMS, offered a proposal to eliminate the income tax exemption enjoyed by the President, Vice President, and all Members of Congress on certain expense accounts. In the case of Members of Congress, that expense account amounts to \$2,500. For the Vice President, it is \$10,000. In the case of the President of the United States, it is \$50,000 a year.

I voted with Senator WILLIAMS to knock out these exemptions. But, unfortunately, we were beaten in committee, 7 to 5.

Now, here is an interesting angle of that Mr. Truman sneers at people who, he says, scream when they are given a \$30 tax bill. But Mr. Truman gets \$50,000 to spend as he pleases, without accounting to anyone—and it is entirely tax exempt. This \$50,000 is in addition to his \$100,000 a year salary and of course, in addition to his regular expense account for running his office.

If Mr. Truman did not have the \$50,000 exemption, he would have to pay the Government \$36,350 on his regular salary of \$100,000. That would mean a total income tax of \$89,136, the same as any other citizen must pay on an income of \$150,000. These figures are on the basis of existing law. They will be much higher in the new tax bill.

I waited hopefully for a message from the White House to go ahead and tax the \$50,000. But Mr. Truman never got around to sending it. He was too busy sneering at people who object to \$30 tax bills.

They are also talking in Washington about Mr. Truman's political speech in San Francisco on the very eve of the assembly which opened the Japanese Peace Conference.

Virtually all the nations of the world were gathered for the signing of the peace treaty. In the American delegation were Democrats and Republicans, working together as a team. Politics was forgotten. The United States of America was showing a united front.

At that time and at that place, when the nations of the world met to advance the cause of peace and freedom, Mr. Truman elected to inject partisan politics into the atmosphere. At a large meeting of Democrats he delivered a rip-snorting stump speech. He attacked the Republican Party. He discussed the 1952 political campaign, and even offered his party a slogan for the next Presidential election.

This speech made front page headlines in the newspapers, providing reading matter for the statesmen from nearly 60 foreign nations.

Here in Washington they are talking about that speech—the bad taste and the bad timing in delivering it. They are saying it is one more example of the prime fact about Mr. Truman, that he is a politician first, last, and all the time.

They say it is another example of the often proven fact that when affairs of state and partisan politics compete for Mr. Truman's attention, affairs of state suffer.

If we have to have prosperity, full employment and a market for our products at the cost of excessive Government spending, never-ending emergencies and the lives of our boys who are dying in Korea, we are in the most desperate situation in the history of the American Republic.

This is ED MARTIN, speaking to you from the Nation's Capitol. I will be with you again in 2 weeks. Thank you for your attention.

Participation of Educators in Government

EXTENSION OF REMARKS

OF

HON. ALEXANDER WILEY

OF WISCONSIN

IN THE SENATE OF THE UNITED STATES

Tuesday, September 25, 1951

Mr. WILEY. Mr. President, I send to the desk a statement and attached articles relative to the teaming up of the Wisconsin State government with faculty of the University of Wisconsin in the service of the public and related matters. I ask unanimous consent that the text of this statement and the articles be printed in the Appendix of the RECORD.

There being no objection, the statement and articles were ordered to be printed in the RECORD, as follows:

GOVERNMENT AND UNIVERSITY TEAMWORK

The State of Wisconsin has long pioneered in a great many innovations in governmental procedure. It has set standards in public administration and related fields which have become a model for the rest of the Nation.

One of the interesting phenomena of recent years in our State has been the considerable extent to which our State government at Madison has drawn upon the talented faculty of the University of Wisconsin, also located in that capital city.

The reciprocal advantages of university professors participating actively in government are clear to every observer. On the one hand, the university faculty gets the

benefit of invaluable, practical day-to-day experience with legislative and executive branch affairs—experience which can thereafter be communicated to the student body upon the return of the faculty to their regular teaching assignments. On the other hand, the State government gets the benefit of the keen minds, the broad intellectual backgrounds of the university faculty.

We all recognize that it is possible, of course, for the wrong type of university professors to be chosen for some governmental post, on Federal, State, or local level. Each of us, no doubt, is familiar with some case wherein an individual suited to academic life but lacking practical judgment might do very poorly in a governmental post. The same thing could, of course, happen in the case of individuals selected from other fields of endeavor. However, I should like to point out that in the experience of our Wisconsin State government at Madison many of its university personnel selections have proven exceptionally fine.

I bring this matter to the attention of the Senate because we have seen a considerable amount of publicity about the wrong type of Government appointments. And so I should like to mention this pattern of sound types of selection. I feel this advisable in all fairness to our institutions of higher learning and their faculties throughout the land.

We recognize, too, that university faculties often represent many different shades of political opinion. Provided that such shades are all within the American framework of devotion to the free enterprise system and our constitutional Republic, there certainly could be little objection to drawing upon the great pool of skill available in the Nation's universities.

What brought this subject to mind was an article by Mr. John Wyngaard in his popular *Under the Capitol Dome* column as printed in numerous Wisconsin newspapers on Friday, September 21. That article is appended hereto.

I have also an illuminating article from the July 1951 issue of the famed educational publication issued by the Bruce Publishing Co., the *American School Board Journal*. This article is entitled "Experts in Public Service." It was written as a guest editorial by Dr. Edward A. Fitzpatrick, the distinguished president of Mount Mary College, of Milwaukee.

Dr. Fitzpatrick has presented very clearly and concisely a statement on what constitutes an expert in public service. He has written it particularly from the standpoint of local schools and boards of education, but I believe that the general principles which he has stressed are applicable in many other situations, and they help shed light on exactly how experts should be used.

One individual once stated that experts should be put on tap, rather than on top, which implies that when utilized intelligently where their talents are best suited, experts can perform on an invaluable basis, but if misused in some unsuitable position, particularly in top level spots, they can do considerable harm.

Dr. Fitzpatrick's excellent article, therefore, appears following Mr. Wyngaard's column.

[From the Janesville Daily Gazette of September 21, 1951]

UNDER THE CAPITOL DOME

(By John Wyngaard)

STATEHOUSE AND UNIVERSITY TEAM UP; ADVANTAGE MUTUAL

MADISON—The transfusion of University of Wisconsin minds and men into the operations of the State government, a mile up the street, is an aspect of statehouse affairs that has had little recognition.

More and more frequently today a legislative committee that faces a difficult or complex job of research will think of the university's staff. More than likely President E. B. Fred will get a call from the committee chairman asking for the loan of a specialist, or for suggestions about a man who could help, which to Dr. Fred is tantamount to a request for one of his faculty members.

Example

Last winter a legislative standing committee charged with analyzing pension bills realized it couldn't keep up with the flow of those measures with its existing staff. It got a University of Wisconsin mathematician.

The other day Senator Robert P. Robinson, chairman of that committee, publicly testified about the value of Professor Larson's work.

A few weeks ago the new judicial council was looking for a competent man to handle its office. Dean Rundell of the law school, suggested Prof. Jack DeWitt, of his faculty, and DeWitt now is secretary of the council. Several years ago Governor Rennebohm wanted a good man to revive the executive office research bureau. One of his other staffers had just completed study under Prof. W. H. Young, of the university political science department, and recommended him. Rennebohm consulted Fred, and downtown came Mr. Young to become one of the key figures of the executive establishment.

Prof. W. D. Knight, of the university's commerce faculty captained the research work in taxation for the legislative council last year, and with his university students and graduate assistants, expects to continue on the job this year. Prof. Harold M. Groves, university economist, is a member of the advisory committee guiding that investigation.

The meaning

There are many other examples, indicating that the capitol and the campus are growing to understand each other better and pooling their energies for the common good. Prof. M. G. Toepel of the university came downtown to head the legislative library last year. Professors Feinsinger and Witte of the school have worked with legislative committees on labor legislation. Last year Prof. Scott Cutlip of the school of journalism, looked over the State's public information services, at the request of the executive office.

The advantages are mutual.

[From the American School Board Journal of July 1951]

EXPERTS IN PUBLIC SERVICE

(By Edward A. Fitzpatrick)

There is plenty of evidence all around us that we do not understand the function of the expert in a democracy. This is particularly true as men presumably expert are appointed to public office. What status should the judgment or opinion of experts have in public life?

THE PROBLEM OF THE NONEXPERT

Let us remove first the problem of the untrained, uninformed, or stupid person elected or appointed to a position of authority. There is a too ready assumption made by the public as well as public officers that election by the "peepul" or appointment by a board immediately confers on such a person all the knowledge, skill, and insight necessary for the job, and to issue authoritative pronouncements from the "chair." This is true of superintendents of schools, of heads of religious communities, and notoriously of the military forces. The absurdity of such a practice has but to be described to be perceived—but there is no

immediate likelihood that it will be discontinued in the foreseeable future.

WHAT IS AN EXPERT?

Now let us take the case of the "expert." Let us exclude the pseudoexpert, the "magnavox," the owl who just looks wise, and the other members of this species. By the expert we mean the person acquainted by special training and experience with a specific field—too often not very broad—who knows the methods of research of the field, its history, and is acquainted with its application. He has done some work following carefully tested techniques which his fellow workers in the field have been able to verify or accept as probable. The area of expertness is in the field of knowledge. In the field of human relations there may be some skill in handling people, but it is likely to be the result of trial-and-error or intuitive rather than, in any genuine sense, scientific. This is particularly true in the field of school administration.

LIMITED CHARACTER OF EXPERTNESS

It should be noted that expertness is often very limited in character, and in the field of school administration the varieties of knowledges and skills called into play are numerous. One danger is that the administrator may be deluded into believing that his opinions in the field of his nonexpertness should have the same acceptance as they do in the field of his expertness. Another danger is that his presumed expertness in knowledge is one thing but its application to a particular situation may be an entirely different problem.

THE BOARD OF EDUCATION AND THE SUPERINTENDENT

Now let us take the practical problem of the school administrator and his board of education. First, the very implications of its organizational set-up. Final decision legally and practically rests with the board as to policy. No matter how expert the superintendent thinks he is or what authority he thinks he has, the final decision on all questions of authority rests with the board. The obligation of the expert is in every case to convince the layman on the board, and the people he represents, as to the wisdom of a proposed policy. Until he has done this, he has no right to act on policies; when policies are once determined he is expected to implement them.

WHAT A REAL EXPERT DOES IN PREPARATION

Let us look at the problem from the standpoint of the expert. If he is a genuine expert he will take care to collect all the information available, he will test it for consistency and for suggestiveness. He will formulate his proposals of policy on the basis of his facts and in the light of experience. His colleagues will also review them as *advocatus diaboli*. He and they should be able to see more objections and loopholes than any school board member could find or conjure up. The true expert will realize that rarely is any problem an open or shut matter in the world of human nature with its individual difference in a world of amazing diversity of conditions. He will know, too, to what extent a given policy proposal is a calculated risk, and he will know the conditions.

HELPING A BOARD TO UNDERSTAND

This is the preparation which the expert will give to his problems. That at times superintendents will bluff, will lobby with a few members in advance, have teachers or parents see board members on a personal basis, need not detain us, but to note the fact and to condemn it. When a superintendent goes before a board after such preparation, putting his cards on the table, he must not assume that the board will act as the superintendent recommends. He

has now to translate his pedagogical and scientific lingo into terms which the board and the people can understand. He must translate his ideas into terms of schools No. 1, No. 2, and all the others. He must frankly face the quality of his teachers and his supervisors. He must place the proposal in its budget setting. He must patiently meet the misunderstandings or mistakes of the parents or board members.

THE SUPPORTS OF AN EXPERT'S PROPOSALS

Proposals have not behind them the authority of the superintendent. They have behind them only the factual information, the order of thinking, the insight, and the practical sense that went into them. That is what will make them expert, and all his Carnegie personality, his membership in the Rotary Club, his authoritative jargon, his appointment, his degrees—all count for nothing. To repeat, his proposals have supporting them only their intellectual worth and practical wisdom which is broader and more secure than mere personal expertness.

NO NEED FOR UNANIMOUS VOTES

There is a false assumption that all proposals to a city school board or a State board of education should be carried by unanimous votes. As the secretary of the Wisconsin State Board of Education I worked up educational proposals when I felt there was an educational need, and often presented them when I knew some members of the board would very likely vote in the negative. If such a policy is not adopted we get opportunistic administration and the administrator trailing far behind his board and his people. The responsibility is on the superintendent for leadership.

EXPERTS IN OTHER FIELDS

I do not want to close without illustrating from other fields a sound theory of the use of experts. I walked into the Philadelphia City Hall one day when there was a hearing on the rates charged by the Philadelphia Electric Co. The discussion was on the cost of certain street lamps. A distinguished professor from the Massachusetts Institute of Technology, qualified as an expert, and asserted "as an expert and from my long experience in the field, and so forth, and taking into account many items which my expert knowledge shows me must be included," the lamps were worth a definite amount, let us say \$25. He was testifying for the public utility. But a distinguished lawyer from the University of Pennsylvania Law School objected and asked how could that be: Here are the very bills in payment of these posts and they are for \$12.50 each. That is one kind of expert we should keep out of school administration.

Another expert is described in Harrington Emerson's *Twelve Principles of Efficiency*. A railroad was having difficulty with its boilers because of the water that was used. A chemist was engaged. He tested the water in all the places, located the watering place of the highest deposit content, proposed a plan for a new building, and so forth. When one of the maintenance of road foremen heard about the report, he pointed out that only 1 percent of the engines took water at that place. While the chemist was right as to the chemical composition of the water, he was woefully wrong in his recommendation in the field where he was taken as an expert and—was not.

THE ONLY SECURE BASIS FOR POLICY

School superintendents and cities are as susceptible to fads, slogans, fashions, in education as human beings are in other areas. So-called expert opinions are often rationalizations of prevailing slogans. There is particular danger in education, and what is called "expertness" is the cloak for deception and for promotion to a larger superintendency.

The only secure basis for any new school policy is the facts, experiences, insights, formulated and stated, which are presented in support of a proposal—and the final judge is not—and should never be—the expert but the layman guided by common sense, a willingness to suspend judgment until all the information is in, a curiosity in discovering the real reasons, and an objective judgment based on his best light.

POSITIVENESS AS RELATED TO IGNORANCE

A final point is a point of human psychology. A person appointed to a position of responsibility and authority is almost certain to be more positive in his opinions and acts in direct proportion to his ignorance or lack of knowledge. He is constantly engaged in protecting his ego and himself. Consequently his orders are all very positive and very brief—brief because no reasons are given. He is quick to charge insubordination, and any opposition is taboo. He is not receptive of ideas, nor willing to hear a frank discussion. He is always willing to have members of the staff accept responsibility for reports, but if they are readily accepted they become "my" policies. There is in short, a real danger that the title of expert is likely to be assumed most blatantly by the least qualified as a defense mechanism, and the real expert is likely to be marked by humility, strength, and freedom.

Address by Prime Minister Alcide de Gasperi Before the National Press Club

EXTENSION OF REMARKS

OF

HON. ARTHUR V. WATKINS

OF UTAH

IN THE SENATE OF THE UNITED STATES

Tuesday, September 25, 1951

Mr. WATKINS. Mr. President, the Prime Minister, of Italy, Alcide de Gasperi, delivered a very able address today to the National Press Club at a noonday luncheon. He pointed up Italy's most pressing problems. He frankly answered questions of the press at the conclusion of his address.

Mr. President, I ask unanimous consent that Premier Gasperi's address be printed in the RECORD, together with a short sketch of his career.

There being no objection, the address and sketch were ordered to be printed in the RECORD, as follows:

ADDRESS BY PRIME MINISTER ALCIDÉ DE GASPERI BEFORE THE NATIONAL PRESS CLUB, WASHINGTON, D. C., SEPTEMBER 25, 1951

This is a joyful gathering for me. It is like seeing old friends again. In my younger days I was a newspaperman and you know we like, even love, the things we liked when we were young.

I am now in government, but I always feel I still belong among you. Perhaps because there is a feeling in me that in democracy a newspaperman's job offers more security than a job in the government. I thought of this when I read an opinion of Thomas Jefferson. He once said, "Were it left to me to decide whether we should have a government without newspapers or newspapers without a government, I should prefer the latter."

So let me now speak to you as one member of the press to others. The fact is that you and we and our friends are engaged in a joint venture fraught with many perils. But we

are certain of succeeding if we dedicate to it our intelligence and resources with the boldness and imagination which we have.

In you, in us, and in our friends, devoted to democracy, respect for the individual and the other ideals of western civilization, there is a deep-seated urge for peace. This desire for peace is one of the major reasons for the North Atlantic Treaty Organization, it is one of the strongest bonds which join us together in our common venture. We have joined together and are building together, for we know that as we grow steadily stronger, the threats to peace will become progressively weaker. Our will for peace, supported by our joint resources will, we earnestly hope and expect, prevent war. But if our hopes and expectations should not be realized, we will be there to meet and check aggression.

Our joint aim is clear, we must together mobilize these resources and progressively strengthen ourselves as quickly as possible to weaken the threats to the peace.

As in a family, a partnership or community, we all have the same fundamental common aims, but we each have different capacities and assets and our contributions to the common cause must differ. What can Italy give?

I would first of all ask you not to look only at the dark side of the picture. True, we are poor in coal, in oil, in iron ore, and almost all other raw materials, and grossly overpopulated in relation to our resources. In fact Italy's existence for years, when viewed only from a statistical standpoint, has seemed an impossibility.

Now take coal, for instance. In your country you produce more than 550,000,000 tons of high quality coal per year. In Italy itself we annually produce 1,000,000 tons of poor grade coal. And look at steel. You produce more than 40 times more per person in the United States than we do in Italy. In different degrees, there are similar differences in the case, of oil, iron ore, and other materials.

Italy has, however, rich resources in the ability and willingness of its industrious people to work. The people of Italy had created an outstanding industrial structure. Shattered by the rule of a dictatorship and by the ensuing war, Italy has nonetheless, with the most generous help of the United States and other friends, started on the long hard road to recovery. Democracy has been reestablished and maintained, under new and constant assaults from those who would create another dictatorship and so too, has its industrial plant. But with Italy's economic situation it has been almost a superhuman task to satisfy our people's demand for an improved standard of living. The Communists have, of course, used every trick and device to exploit our economic situation for their own purposes. We have met their challenge.

We have increased production in factories and on farms. We are driving ahead with land reform and with other reforms as hard and as fast as it is feasible. You have helped us do this. But we have to struggle against one major problem of which of course, you are certainly aware, but which will never be sufficiently stressed, namely, overpopulation. I shall not quote any more figures. I shall simply say that this structural problem has been tackled in every possible way.

We realize that we must leave no stone unturned to reduce unemployment in Italy and to raise the standard of living of our people. But we have too many people for the size of our country and its availabilities. In the past, heavy immigration from Italy was—if I may say so—not only a benefit for Italy but also for her friends. Through a free and unfettered movement of persons we can help each other, and by the interblending of our civilization, our ways of living and our peoples, we can make it more possible to work together to achieve our great common

aims of peace, freedom and security for our children and our children's children.

Moreover, surplus manpower in one of the Atlantic Treaty countries can be turned to the benefit of the common effort.

The people of the United States are already producing for defense at an astounding rate and are expanding their plan to produce more. If common defense is to be ensured, the people of Italy and the peoples of the other Atlantic Treaty countries could also produce more, wherever there is available plant and manpower. On a practical and selective basis, we can share the task with you.

The real problem is not military or economic aid for Italy and the other Atlantic Pact countries. The real problem is how do we mobilize our resources for our common goals in as short a time as possible? By, for example, utilizing labor and plant in Italy, for the production, say, of precision bearings for military aircraft and vehicles, electronic items for radar, oil for military aircraft and vehicles, rather than building new plants here, would we not get the goods sooner?

There is also the moral aspect of the problem. I mean that starving or discontented people cannot produce properly, they cannot be strong as a defense force, or cannot effectively resist the lure of the extremists. Many of the people in our country who voted Communist are not followers of Marx and Lenin. They are simply people who do not have enough to eat or people who do not feel secure about work and their standard of life. These conditions must not be made worse, but must be improved in the interest of our security.

The desire of the Italian people to contribute to the fullest extent possible to the speedy mobilization of the defense of the Atlantic community cannot, however, be fully exploited until certain moral requirements are fulfilled. I refer to the clauses of our peace treaty, awkward and obsolete shackles on the dignity of a democratic nation.

The same can be said of Italy's admission to the United Nations.

We are trying to make a clean slate of this bitter inheritance of the past, so that we can build for the future and work with confidence and determination. In this spirit we hope that the Trieste question will find a solution according to principles of justice and on the basis of the assurance which we have repeatedly received.

I have tried to outline the problems which directly affect the life of the people of Italy, both politically and economically. When they are solved, Italy will be able to play her full role as a member of united Europe which she has always promoted.

Much still remains to be done, and it will be done. For we stand united and I trust that, through our joint action, peace and freedom will be secured for the world and its civilization.

ALCIDE DE GASPERI

Born in Pieve Tesino (Trento) on April 3, 1881, married to Miss Francesca Romani, father of four daughters.

Doctor of philosophy and philology.

Publicist

From 1908 to the downfall of the Austrian Empire, as a student, a journalist, and a politician, he was intensely active on behalf of the Italian cause.

Member of the Austrian Parliament from 1911 to 1918. After the annexation of the Trentino by Italy he was elected in 1921 to the Italian Chamber of Deputies.

In 1926 he was forced to leave—after 20 years—the editorship of the newspaper *Il Nuovo Trentino*, suppressed by Fascist authorities. In 1926 he was arrested and jailed.

He took part in the underground anti-Fascist movement.

In 1944 Minister Without Portfolio, in 1945 Minister for Foreign Affairs.

In 1945 and 1946 President of the Council of Ministers and Interim Minister for Foreign Affairs. President of the Council of Ministers and Interim Minister for Italian Africa in 1946-51.

De Gasperi has been continuously at the head of the government from December 10, 1945.

In August 1951 he once more became Minister for Foreign Affairs.

The Lone Sentry's Reverie

EXTENSION OF REMARKS

OF

HON. GEORGE M. GRANT

OF ALABAMA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. GRANT. Mr. Speaker, Mr. J. Mitchell Pilcher, of Montgomery, Ala., recently had published in the New York Times a sonnet, *The Lone Sentry's Reverie*, which describes the thoughts of an American soldier whose "thoughts of home, after the night watch in a weary land," help him to drive out "night's remnant fear," as he daydreams "by a roadside in Korea":

THE LONE SENTRY'S REVERIE

The day brings hope with thoughts of home,
after

The night watch in a weary land—the air
Seems full of gentle whispers, like soft laughter

When happy children tiptoe on the stair.

The sky is a mirage of sunlit hills

Of home, clear as the redbreast's trumpet
call,

When to his note the rolling meadow thrills,
And lavish Autumn's harvest gladdens all.

Across the miles, now seated for the meal,

The family looms and baby brother's head
Bows with the rest, and grateful smiles reveal
Thanks for the proffered food when grace
is said

A lone sentry drives out night's remnant fear,
Daydreaming by a roadside in Korea.

Columbia River Development

EXTENSION OF REMARKS

OF

HON. WARREN G. MAGNUSON

OF WASHINGTON

IN THE SENATE OF THE UNITED STATES

Tuesday, September 25, 1951

Mr. MAGNUSON. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD resolutions adopted by the Mid-Columbia Community Conference at a meeting held in the city of Kennewick, Wash., on August 18. The resolutions definitely express the feeling of all the organizations and representatives, in all walks of life, in the entire Pacific Northwest, regarding the development of the Columbia River and all of its allied func-

tions. The resolutions voice the sentiments of the senior Senator from Washington.

There being no objection, the resolutions were ordered to be printed in the RECORD, as follows:

Recorded below you will find the resolution as adopted by the Mid-Columbia Community Conference in its concluding session on Saturday, August 18, 1951, in the city of Kennewick, Wash. This conference represented more than 300 delegates from 47 cities in the three States of Washington, Oregon, and Idaho. The following resolution was adopted by acclamation of the conference. We trust that you will accept it for what is it, the free expression of free-thinking people at the grass roots level as to their thoughts, wishes, and desires in regard to our western development program.

"RESOLUTION"

"This conference does hereby wholeheartedly endorse the comprehensive plan for development of the Columbia River and its tributaries as proposed and agreed upon and last set forth in schedule T, a defense program, by the Bureau of Reclamation, the Army engineers, the Department of the Interior, and the Department of the Army. In so doing, we realize any talk of the Columbia River must necessarily include the Snake River as an integral part.

"We urge the early appropriation by Congress of funds needed to start carry on, or complete work now authorized on Albeni Falls, The Dalles, Ice Harbor, Chief Joseph, and McNary Dams. We urge the early authorization by Congress for construction of Hell's Canyon Dam. In each of these dams consideration must be given to their multiple-purpose functions including the supply of power for national defense, the irrigation of lands now idle, navigation requirements, fishing interests, and the preventing or minimizing of disastrous floods. We also urge the appropriation of funds for the accelerated study of salmon conservation and propagation in the interest of promoting the fishing industry.

"We realize the continued growth and development of the Northwest is now threatened by lack of power at a time when only a fraction of the potential of the Columbia River and its tributaries has been developed, and that unless additional power facilities are developed, present facilities will not care for existing defense requirements in years of water shortage just as power for defense is now endangered during this coming winter.

"The development of the Columbia River and its tributaries is not a question of political policies or parties but rather a question of the best interest of all the people. The development must be in a coordinated, unified manner with priorities based on sound engineering practices and economic justification. We know all costs of the development, or power and irrigation are repaid by the people of the Northwest and that existing projects are proving sound investments. We also realize private capital and State governments have not shown themselves able or willing to carry on projects of the size here in question and the work must necessarily be carried on by the Federal Government.

"We strongly urge the communities represented at this conference to be present at the hearings of the Columbia Basin Interagency Committee to be held this fall at a time to be announced.

"We thank the city of Kennewick and its chamber of commerce for their hospitality as hosts to this conference.

"We thank the Army engineers and the Inland Navigation Co. for their assistance in making possible the trip from Pasco to

the McNary Dam down the Columbia River and the inspection of the dam. We also thank the representatives of the press and radio for their fine coverage of this conference.

"It is the sense of this conference that the spontaneity of the interest shown by representatives of the many cities and communities of Idaho, Oregon, and Washington expresses the strong and unified support of the multiple purpose Columbia Basin program as herein previously adopted."

Missouri River Basin Development and the Pick-Sloan Plan

EXTENSION OF REMARKS OF

HON. LESTER C. HUNT

OF WYOMING

IN THE SENATE OF THE UNITED STATES
Tuesday, September 25, 1951

Mr. HUNT. Mr. President, for several years it was my pleasure to meet monthly with an organization known as the Missouri River Basin Interstate Committee, an unofficial organization. Its purpose and objective was to foster and promote the Pick-Sloan plan of development of the Missouri River.

Mr. President, an article entitled "Pick-Sloan Plan Is Best for Area, Editor Declares," written by Rita Robison, a staff writer, appeared in the Casper (Wyo.) Tribune-Herald of August 30, 1951. It gives the views of an outstanding construction authority of national reputation on the so-called Pick-Sloan plan on which is based the authorization for construction of the Missouri River Basin project in the Flood Control Act of 1944. Mr. H. W. Richardson, who is the editor of Construction Methods and Equipment, a nationally known magazine of particular interest to the construction industry, has completed a tour of the Missouri River Basin, and has viewed first-hand the progress and objectives of the program which is being prosecuted by the Bureau of Reclamation, of the Department of the Interior, and the Corps of Engineers, of the Department of the Army.

Mr. Richardson's views are of particular interest not only to Wyoming, but to the other States in the Missouri River Basin, as well as to the Congress and the people of the country as a whole. The article is as follows:

I ask unanimous consent that the article be inserted in the Appendix of the RECORD.

There being no objection, the article was ordered to be printed in the RECORD, as follows:

**PICK-SLOAN PLAN IS BEST FOR AREA, EDITOR
DECLARES**

(By Rita Robison)

A conviction that the Pick-Sloan plan is probably the best that could be devised for the development and conservation of water resources in the Missouri Valley was voiced by H. W. Richardson, construction authority visiting in Casper Wednesday.

Mr. Richardson, editor of Construction Methods and Equipment, published by McGraw-Hill in New York City, is completing

a tour of the whole Missouri Basin which began in Omaha and took him through Nebraska, the Dakotas, Montana and Wyoming.

"The Kansas City floods have stirred up another wave of demands for a Missouri Valley authority, more studies, surveys and planning ad infinitum. We have the planning, studies, and surveys that have been made over a good many years, especially the last decade," explained Mr. Richardson.

"The Pick-Sloan plan is not based on snap judgment or inadequate information. Congress directed both the Bureau of Reclamation and the Corps of Engineers to make separate and complete studies of the basin. The reports were identical in general principles, so it was simple for the agencies to meet in Omaha late in 1944 to consolidate the plans. Congress approved the Pick-Sloan plan, and is now making appropriations yearly for its execution."

WYOMING TO BENEFIT

Mr. Richardson explained the meaning of the plan as multi-purpose, giving local flood protection and developing water supply, power, recreation, irrigation, underground water replenishment and navigation possibilities of the entire basin. Of the 108 proposed dams, only 8 are on the main stem of the Missouri River, with the rest on tributaries and smaller streams.

He added: "For Wyoming, this will mean additional irrigated land, several beautiful recreation spots, replenishment of dwindling ground water supplies and flood control.

The editor answered critics who claim that the Pick-Sloan plan is a monstrous extravagance forced on the United States by the two agencies by pointing out that this long-range development is the direct responsibility of the citizens through their Congress.

"From a construction standpoint, the methods are the cheapest and best, because every project is built by private contractors who bid competitively. The Army Engineers design and act as supervisors of the whole project, but have no part in the actual construction." He advanced this point in argument against a Missouri Valley Authority based on the TVA.

MORE STUDIES USELESS

More studies, planning, and talking are useless. I doubt if any other agency, including a Missouri Valley Authority, could come up with a better plan for conservation and utilization of Missouri Basin water. The TVA is a little government all its own, whose financial manipulation sometimes is hard to follow. It is a big step in socialized government.

"Whatever success the TVA has had is largely due to the fact that it is a small basin homogeneous in topography, economics, and type of people in contrast to the vast Missouri Valley, which takes in one-sixth of the entire United States. It varies tremendously in topography, rainfall, economics, land use, and people. There is everything from the highly industrialized Kansas City-St. Louis area and the rich farm land in the lower valley to the sparsely settled and arid areas of the upper valley."

Speaking again of costs, Mr. Richardson pointed out that the TVA set up its own construction organization which has all the possibilities of inefficiencies inherent in our complicated bureaucracy.

In a tribute to the independent westerners, Mr. Richardson doubted if the people, especially in the upper valley, would desire to see another Government agency controlling their destiny.

PEOPLE HAVE AUTHORITY

"If you people of the Missouri Valley do not like what the Corps of Engineers and the Bureau of Reclamation are doing in developing the basin, don't blame the agen-

cies. They are acting at the direction of your Congressmen, who have approved the general plan and appropriated money for each and every project separately.

"You people of the basin have the final say through your own spokesmen in Congress."

Payment for this long-range development is made partly by citizens of the entire United States, by benefited land-owners, and by power sales. Lt. Gen. Lewis A. Pick, Chief of the Army Engineers, and W. G. Sloan, planning engineer for the Bureau of Reclamation, are the men who devised the plan and are executing it under the direction of Congress.

Construction of American Freight Ships

EXTENSION OF REMARKS

OF

HON. WARREN G. MAGNUSON

OF WASHINGTON

IN THE SENATE OF THE UNITED STATES
Tuesday, September 25, 1951

Mr. MAGNUSON. Mr. President, Congress passed legislation some months ago authorizing the construction of 35 mariner-class fast freighters. An appropriation was made for that construction, but apparently since that time, although the Maritime Board has gone ahead with its plan and has designed probably the most modern type of freighter in the world in order to supplement our merchant marine, apparently there has been some difficulty in connection with the question of the allocation of steel, which the Senator from Washington cannot quite understand, because the adjunct of these 35 fast freighters is just as much a military necessity as a tank or a gun or an airplane. In any event, it has caused a great deal of concern in maritime circles.

I ask unanimous consent to have printed in the RECORD an editorial on this matter, published in the Marine News of September 1951.

There being no objection, the editorial was ordered to be printed in the RECORD, as follows:

The honorable Congress of this Nation directly represents 150,000,000 people in these 48 sovereign States, which comprise the great Union of the Republic of the United States. It is their sworn duty to cause proper legislation to the best interest of the good citizens of this country, and to safely protect this, our beloved land.

The great Congress has been defied, besmitten and chastized for daring to do their duty under the Constitution, for daring to authorize ships to be built for use by our armed forces and for our Nation's commerce; ships that can outrun the enemy's submarines, ships that are high in speed to supply our armed forces at our far flung military outposts, ships that are very badly needed. And who is the culprit who dares the Congress and the wishes of the people of the United States of America? Who? A little unknown quantity in shipping experience, and as far as shipping needs are concerned, a nobody, a one Manly (?) Fleischmann.

Congress passed necessary emergency legislation for the construction of 35 mariner class fast freighters—the C-4 type—and the President signed. The Federal Maritime Board was directed to complete construction of these vessels with all possible speed, in accordance with the defense mobilization

program to arm the Nation against the Communist plans for world conquest.

Admiral Cochrane, who knows what he is doing when it comes to ships, called for bids and awarded the contracts to build vessels in accordance with our law and the wishes of the Congress. The shipbuilders and the hundreds of allied contractors engaged to expedite the construction of these vessels set up their production schedules far in advance. This was in accordance with the War Production Board's directives. The builders let out subcontracts to cover the necessary needs in completing the construction of these much needed 35 vessels. Everything was set, the green light was on, patriotism was guiding these Americans.

Bang. What happened? Mr. Manly (?) Fleischmann, who holds down two jobs in the Federal Government, must have gotten confused between jobs and decided to defy the wishes of the 532 Americans serving in our Congress and run the war (insofar as these ships are concerned) to suit himself. Here is his trick in stopping the building of these ships. One hundred and fifty-one thousand tons of steel were needed to build these vessels. Mr. Fleischmann decided to cut the program down 33 percent. Now, mind you, he would only grant 102,000 tons of steel—a reduction of 49,000 tons. The production schedules of all the firms involved was thrown right out the window—disrupted and befuddled as a matter of fact. Mr. Fleischmann said: "We don't need the ships at this time."

It is the duty of Congress to determine whether this act of Mr. Fleischmann's is sabotage, ignorance, or sheer stupidity. Who is he to defy our Senators and Representatives? Who is he to weaken our sea supply lines to our Armed Forces? Who is he to say, "We don't need the ships at this time"?

Mr. Fleischmann's arbitrary act not only interferes with our production schedules but tends to undermine the people's confidence in our national legislative body. This is really dangerous. Congress must haul this man before them and have him explain his mistake before the proper committee to explain this faulty act that is causing the restriction in vessel construction. Who advises this man? What is his philosophy? Find out, and remove him from Government if necessary. Congressman HART, please correct this terrible blunder. You are real Americans.

Experience of Lt. Rolly G. Miller in Korea

EXTENSION OF REMARKS

OF

HON. JOHN O. PASTORE

OF RHODE ISLAND

IN THE SENATE OF THE UNITED STATES

Tuesday, September 25, 1951

Mr. PASTORE. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD a column by Malcolm Epley appearing in the March 19, 1951, edition of the Long Beach (Calif.) Press-Telegram. It includes a letter written by Lt. Rolly G. Miller to his mother from Korea. I was impressed by Lieutenant Miller's understanding of the reasons for the military campaign we are leading in Korea. The letter stands as a monument to the patriotism of Lieutenant Miller, for he was killed in action in Korea on May 31, 1951.

There being no objection, the column was ordered to be printed in the RECORD, as follows:

BEACH COMBING

(By Malcolm Epley)

On the desk is a letter from a soldier in Korea that is different.

The writer is Lt. Rolly G. Miller, who is in C Battery, Eighth Field Artillery Battalion, supporting the Third Battalion of the Twenty-seventh Infantry Regiment, Twenty-fifth Division, Korea.

A Poly High grad, he is the son of Mrs. Edwin J. Cook, 4819 Trimble Court.

Mrs. Cook sent the letter because it seems "quite a contrast from some of the letters I have read from the boys."

Here are some excerpts:

"I'm back with the infantry, with my old company which took so much punishment in holding Sobukson in September. Of course there are some new faces—Captain Mac and I were very close and he is gone—and some new men in ranks, but most of the old noncoms and the company officers are the same. It's funny how a severe action kind of makes you feel like a family, and that's pretty much the way it is.

"We're going to cross the river and take the bull by the horns shortly. We'll be in the assault wave, and I'm proud to go with this company of Wolfhounds.

"So many things of a critical nature have been said of this campaign it would take volumes to hold them. We are fighting a godless thought. However right or wrong may be the means, we're combating this ideology. If we accomplish nothing more than proving to the world we'll fight with the little guy to protect his dignity as a human being, I feel we have done enough to justify the sacrifices we have made."

After remarking that every American will have to learn that advantages we enjoy shouldn't be taken for granted, this lad wrote:

"This experience will do the country good. . . . If only they (Americans) can realize that it's more than a sacrifice we have to endure; that it's a duty we must perform and that it's an honor to be selected to do it.

"Some of us will wear uniforms and have to fight. Others will, of course, fight with tools and wrenches at home. But I would feel so much better if I knew that we are all fighting with understanding - with love for the poor little guy who doesn't know anything except that his house is now just a little pile of black rubble and that most of his family is dead, and with ruthlessness for the ideology behind these atrocities. . . .

"Over here . . . you learn to understand people who are different from you. There are so many good points, as well as bad, in everyone. By working and fighting alongside these peoples of different colors, creeds, and backgrounds we are, at the same time I hope, beginning to learn how we may better live with them. Everything is so tremendously significant when you ponder it for a while."

There's an undertone of optimism in Lieutenant Miller's letter, seeming to spring from his rare discernment of the reasons he is where he is and is doing what he is doing.

He voices a philosophy that needs wide dissemination, at home and over there, because we've got to make the awful sacrifices of Korea pay off constructively.

It is common to ask: "What are we fighting for?" and in the question there must be terrible tragedy for those who have lost relatives or friends in Korea. Have they given everything for nothing?

The answer to that question is yet to be written, and we who live when the fighting ceases must write it. The Long Beach soldier in Korea, penning a letter to home folks while waiting for the call to "cross the river and take the bull by the horns," has indicated what can make Korea a glorious achievement and not a meaningless slaughter.

Men like Lieutenant Miller will win the military victory, but making that victory, but making that victory worthy of its terrible cost is the task of all of us. The men who fight always do their part well—it is the others who fail.

Responsibilities of a Party National Chairman

EXTENSION OF REMARKS

OF

HON. JOHN J. WILLIAMS

OF DELAWARE

IN THE SENATE OF THE UNITED STATES

Tuesday, September 25, 1951

Mr. WILLIAMS. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD an editorial entitled "What He Is Not For," published in the St. Louis Post-Dispatch of Saturday, September 22, 1951. The editorial relates to a press conference held by President Truman.

There being no objection, the editorial was ordered to be printed in the RECORD, as follows:

WHAT HE IS NOT FOR

The very worst side of President Truman's old Pendergast background came out in his press conference when he was asked to comment on the latest disclosures in the Boyle-RFC case.

Turning to Raymond P. Brandt, chief Washington correspondent of the Post-Dispatch, who brought up the question Mr. Truman asked: "What's a party chairman for?"

The way to answer that brazen question is to say what a party chairman is not for.

He is not for calling up a Government agency such as the RFC on loan matters.

He is not for influencing an independent Government agency to grant a loan which it had declined to grant.

He is not for interposing political pressure in situations which should be decided on merit.

He is not for creating a double standard of treatment in the Government—one treatment for those with political friends and another for those lacking political friends.

He is not for using his party connections as a sandbag to curry financial support or other aid from citizens who wish to do business with the Government.

Harry Truman knows all this.

His cynical retort can be taken as a temperature reading on the hot water in which his Democratic national chairman finds himself.

The best that can be said for this callous crack is that it was not the President of the United States speaking.

This was the machine-drilled local politician from Jackson County.

Premier Alcide de Gasperi

EXTENSION OF REMARKS

OF

HON. VICTOR L. ANFUSO

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. ANFUSO. Mr. Speaker, it is a happy reflection for me to note that Premier Alcide de Gasperi, of Italy, yesterday was enthusiastically welcomed in a joint session of the Congress.

I was particularly impressed with the humility and sincerity of this 70-year-old statesman who stated:

We would not come to you urged only by material needs. If we did, we would not deserve consideration nor your friendship. But as freemen to freemen we wish to tell you we are grateful to you because by demanding the revision of our unfair peace treaty, you have acknowledged that an effective and staunch alliance cannot exist without equality of rights and full recognition of the independence, sovereignty, and dignity of a nation.

Here is the expression from a people who are grateful for the great American aid given them and who offer to fight side by side with our American boys with no strings attached.

We could answer that offer of friendship by passing a resolution now urging the modification of the unjust Italian Peace Treaty signed in Paris on February 10, 1947.

For the information of my colleagues I offer the following article written in the New York Times of Sunday, September 16, 1951, by Arnaldo Cortesi:

ITALY'S "INDISPENSABLE" PREMIER—A PORTRAIT OF ALCIIDE DE GASPERI, WHO VISITS WASHINGTON FOR THE SECOND TIME NEXT WEEK

(By Arnaldo Cortesi)

ROME—Premier Alcide de Gasperi of Italy, whose talks in Washington next week with President Truman and Secretary of State Acheson will have profound bearing on the future of Italy and the defense of Western Europe, is a different man from the one who first visited the American Capital in January 1947. Then he was a comparative newcomer to the international stage, the head of the government of a conquered country still occupied by Allied troops. He was an unknown quantity, a political question mark, whose worth and capabilities were still to be tested in the school of experience.

Today Signor de Gasperi is an acknowledged key figure in the world-wide struggle of democracy versus communism. His achievements in Italy have proved him to be the strong leader of a country of great strategic importance. When he took over the premiership in 1945 the country was in a state of chaos. Wages were running a losing race with prices. The Communists were in the Government and rapidly becoming masters of the state from the inside. Riots and bloodshed were almost daily occurrences and the Italians trembled under the constant threat of a left-wing uprising. The prostrate people were desperate enough to heed the counsels of desperation.

Against these odds, de Gasperi set to work. The overwhelming victory of his party in the crucial elections of April 1948, was a testimonial to his effectiveness. It slammed the door in the face of Communist hopes and

firmly aligned Italy with the Western democracies. Since then the country has, under his leadership, largely recovered from the wounds of war and is now a full partner of the west in the Atlantic Pact. That a due share of the credit for recovery must be given to American aid does not detract from the part played by de Gasperi.

The Premier's political thinking is dominated by his belief in the necessity of sparing the world the scourge of another war and is based on three profound convictions: (1) that communism must be prevented at all costs from advancing on the home front; (2) that Italy must collaborate with the United States to the full extent of her possibilities; (3) that the Atlantic Pact must be made into a successful instrument of peace. As a corollary to this last, the western nations must speed their rearmament and be in a position as soon as possible to oppose a solid military, as well as political, front to possible Russian aggression.

Moreover, the Italian leader is convinced that free Europe must unite for its own protection. Speaking of Italian-American collaboration, he recently lamented that the United States has not sufficiently pushed the idea of a United Europe. "I am satisfied, of course, with the financial assistance that has been given us," he said, "but closer psychological cooperation is desirable. America must help Europeans to find themselves. I know the difficulties and delays that arise in Europe, but the men of the American democracy must insist with skill and patience. It is necessary to awaken and feed the idea of a united Europe. In propaganda we must take the offensive."

The same belief in taking the psychological initiative applies to de Gasperi's major objective of combating the efforts of communism on Western Europe's home fronts. He does not share the pessimism of those who think that Italian communism showed materially increased strength in the provincial and municipal elections of last May and June—in fact, he has cited figures to prove the contrary. Nevertheless, he feels that the admittedly large Communist strength in certain West European countries could be lessened by a more intense propaganda effort on the part of the west.

"Nobody should be surprised," he said to this correspondent shortly before his departure, "if the Communists succeed in convincing many people with their international propaganda that the Atlantic Pact represents a danger of war instead of a guaranty of peace. The spectacular agitations carried out by an efficient organization must in the end penetrate some minds. Every time there is a holiday in a large European city Communist manifestations for peace are staged, resolutions in favor of peace are voted, money for peace is collected.

"On our side, ministers and generals meet in private conferences, and arms are unloaded. All well-informed persons know that beyond the iron curtain a large number of divisions are arrayed and every possible energy is devoted to the production of arms. But the great mass of the people cannot peer through the iron curtain and, seeing only one side of the picture day after day, end by believing that everything is peaceful there and that only on this side is anyone concerned with military affairs. I am aware that this is only one aspect of the question, but the fact remains that we need more propaganda, more psychological dynamism, more dialectic and polemic force."

This attitude toward home-grown communism contrasts with the criticisms that have been leveled at de Gasperi from some quarters where it is felt that he did not take a strong enough line with the Italian Communist Party. His view is that in a democracy

any party must have the full protection of all constitutional guarantees as long as it is not outlawed—and outlawing the powerful Italian Communists would encourage them to make infinite trouble.

He points out, in his own defense, that the west is not free of blame for the present strength of the Communist Party in Italy. "The Communists," he said, "participated in my first three cabinets—as long, in other words, as the democratic states collaborated internationally with the U. S. S. R. and as long as Italy, a conquered country, was faced by a coalition of the United States, Britain, France, and the U. S. S. R., which imposed an extremely harsh treaty on her. Then, nobody gave us a helping hand, as is being done today with Japan. It was in this period that the Communists consolidated their positions in France and Italy."

It is not to be expected, of course, that all parties should be enthusiastic about de Gasperi's policies. He is the target, in fact, of much criticism from both right and left on nearly all issues. One of the chief of these is land reform, for which there is much pressure, matched by vigorous and vociferous opposition; his critics charge him with delay when decisive action is called for, though, in fairness to de Gasperi, it should be added that the land problem is so complex that it does not admit of easy improvisations.

Again, on internal policy, the right charge that he is weak toward communism, is matched by the left assertion that he has set up a police state, in which the *celere* (motorized police) is free to tyrannize the workers. Of unemployment, the right claims he does not spend freely enough on productive enterprises and that the refusal to countenance wholesale dismissals of surplus workers perpetuates the problem it seeks to cure. Here the left charges that he doesn't want to cope with the situation and that what little has been done is inspired by the United States.

Inflation is another cause of dispute. Government credit restrictions, though not considered bad in themselves, seem excessive to the right, working particularly to the disadvantage of small industries. The left says that they have proved inadequate to check price rises and are hampering production.

The Atlantic Pact and Italy's share in it also comes under attack. The right feels that, in the negotiations, de Gasperi has shown little skill in wresting concessions from the West. To the left the pact together with ECA is the means of chaining Italy to the chariot of "American warmongers." Similarly, on the question of treaty revision, the right feels revision is a moral question that would permit Italy to regain an equal footing among nations, while the left declares that revision would only mean increased armaments, hastening the day of East-West conflict.

For all the criticisms, de Gasperi has often been called indispensable. Many Italians may feel that he really is, for he has been a member of the Cabinet since December 1944, is now at the head of his seventh Cabinet, and has been President of the Council of Ministers—his official title—uninterruptedly since December, 1945. Only Clement Attlee of Britain exceeds him, in the western democracies, for continuous tenure.

Indispensable or not, de Gasperi would be the last man to refer to himself as such, either in earnest or in jest. He is extremely modest and possesses a humility which makes him more conscious of his shortcomings than boastful of his virtues. He thinks of himself as a man, neither better nor worse than the majority of his fellows, who has been elevated, more by force of circumstances than by any extraordinary merits of his own, to a position of leadership. Though his manner has of

late become more authoritative, power has not turned his head, and he is as far as any man in the world from believing that his true or fancied indispensability bestows any rights upon him beyond that of working hard for what he conceives to be the welfare of the Italian people.

In physical appearance Signor de Gasperi strongly resembles Eamon de Valera of Ireland. He is a tall, thin, bespectacled, clean-shaven, hollow-cheeked, slightly stoop-shouldered man with graying blond hair, a prominent nose and a very wide mouth. Now a vigorous 70, he looks young for his age, though his health is not perfect (he suffers from a stomach ailment.) He can, when occasion demands, deliver an extremely effective speech, but in a country that overflows with turgid oratory he is not accounted an outstanding public speaker. He lacks the personal magnetism, the theatricality, the bombast, that Latin people seem to love and that are generally associated with the men who have risen high in their political favor.

He is a devout practicing Catholic and makes no secret of the fact that his policies are inspired by Catholic principles, but is far more independent of ecclesiastical influences than his opponents say. He strongly resents any interference by church authorities in political affairs, and has visited the Pope only once since he became Premier. He is aware that many Italians, though deeply religious, are strongly anticlerical and that it is therefore good politics to avoid even the appearance of being under the thumb of the church.

His independence has been repeatedly proved by the manner in which such organizations as Catholic Action and the Civic Committees—both of them lay bodies dedicated to the defense of Catholic principles—have been openly critical of some aspect of his government's policies. Despite this, one of the favorite refrains of Communist propaganda against de Gasperi is the statement that he is a mere puppet in the hands of the Vatican.

Among the personal qualities that have enabled de Gasperi to rise to the top of the political heap and stay there, first place must be given to his intellectual integrity. He once told this correspondent that the secret of his political success lies in the depth of his convictions. "I am most certain," he said, "that if Christian Democracy [his own party] were to crumble, democracy in Italy would fall to the ground and freedom would be in danger. No effort, no sacrifice, must be spared to avoid this."

He has been dubbed a master of compromise for the consummate skill with which he solves apparently insoluble political situations. But he has never compromised with his principles. He was hardly out of his teens when he was arrested in Innsbruck by the police of the Austro-Hungarian Empire for agitating in favor of an Italian university in that city. Thereafter he dedicated his youth to the union of Trento and Trieste, then ruled by the Hapsburgs, to Italy; and in 1926 he was arrested by the Fascist police and sentenced to 4 months in prison, but he was no sooner released than he was working again for the overthrow of a regime that he considered ethically evil, politically unsound, and pregnant with great misfortunes for the Italian people.

Today de Gasperi's love of democracy and personal freedom amounts to a positive passion. Democracy has been the guiding principle of his life, a thing to be fought for and cherished not only when one is one of the "outs" but also, and especially, when one is one of the "ins." Some people who pay lip service to democracy maintain that there is a conflict between the principle of democracy and the principle of authority. De Gasperi will admit no such thing and is resentful when anyone suggests it. Anything that is contrary to democracy is repulsive to him.

Another of the Premier's outstanding qualities is his transparent frankness. This is perhaps the result of an early training in journalism. At the age of 24 he was the editor of the Italian Irredentist newspaper *Il Nuovo Trentino* in Trento (then a part of Austria-Hungary), which he ran on a shoestring, often skipping his meals to save the money with which to pay his printers' wages. Even today he is more of a journalist than a diplomat, often amazing foreign ambassadors by the open-hearted candor with which he speaks to them. Till they learn to know him well, they usually suspect a trap and do not believe him.

Most Italians are impressed by the simplicity of de Gasperi's life and habits. He has been poor ever since his student days, when he subsisted largely on free soup distributed by a charitable institution in Vienna. He now lives in the same house, and in exactly the same way as when he was a minor employee at the Vatican library, eking out a salary of \$40 a month by sitting up at night to do translations from German into Italian at a minuscule fee per page. He spends almost no money on himself.

It is said that just before he left for Washington in 1947 a friend noticed that his luggage was not up to the dignity expected of a Premier. It had been cheap when bought a quarter of a century earlier and had reached a terrible state of dilapidation. The next morning de Gasperi received a complete new set of expensive luggage from an anonymous donor. It was this luggage that permitted him to cut a dashing figure on his first visit to America. He has not discovered who sent it to him.

He is a home-loving man. His wife will occasionally interrupt him while he is presiding over a Cabinet council with some such telephone message as: "Don't be late for lunch today; we are having polenta (a corn-meal mash) and sausage." At his wife's insistence he sometimes leaves his work early, but she is a long way from curing him of his habit of lingering at his desk until long after ordinary mortals are having their afternoon naps or have retired to bed for the night.

One of his great sorrows is that he has no son, and he has lavished his love and affection on his four daughters, Maria Romana, Lucia, Cecilia, and Paola. He superintended every phase of their education, to the extent of personally giving them singing lessons. He grounded them thoroughly in the classics and brought them up without any highfalutin' notions. For recreation—when he can get away from the cares of his office and his family—he is fond of playing bocce (an Italian variety of bowls), of singing the mountaineer songs he learned as a boy in his Alpine birthplace, and of walking.

The people who know de Gasperi best praise his gentleness and goodness of heart. He is fiercely attached to his friendships and shows lasting gratitude to anyone who has occasion to do him a favor. This quality is thought by some to lead him astray. His critics, in fact, maintain that his reluctance to hurt anyone has caused him to put up with Cabinet Ministers and other officials of whom he would have been well advised to rid himself, and that his tolerance is responsible for delay in necessary reforms.

As de Gasperi made ready to leave for Washington, the problem of Trieste offered a perfect example of how his critics from both extremes tend to cancel each other. Conservatives are saying the Government has not shown enough firmness in demanding the return to Italy of the whole Free Territory. Leftists answer that Trieste has become an anti-Russian military base and demand that it be made truly free by withdrawing all foreign troops.

However, the fact that de Gasperi's critics balance one another so evenly should not cause Americans to underrate its importance

for the stability of his regime. It is probably difficult for people who live 5,000 miles away to understand the depth of emotion with which Italians regard Trieste. A solution unfavorable to Italy would certainly cause such a revulsion of feeling that Italy's further presence in the Atlantic Pact would be open to question and de Gasperi and his Christian Democratic Party would be in danger of being swept out of office.

For that reason it is the sincere hope of all lovers of democracy in Italy that the Premier may return from Washington with assurances that Italian hopes in Trieste will not be disappointed. Washington officials should keep in mind de Gasperi's value to democracy, as they give consideration to the issues he raises.

Technical Skills for Soil and Water Conservation

EXTENSION OF REMARKS OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following article by H. H. Bennett, Chief of the Soil Conservation Service, from the *Scientific Monthly* of October 1950:

For the first time in history, conservation of land, water, forest, grass, cultivated crops, and wildlife are being scientifically coordinated on the basis of land capability and need. I believe I can say that the national policy and public thinking, with few exceptions, are agreed on the utter necessity of conserving these interlocking natural resources. Research, education, surveys, and the successful application of conservation measures have brought us to a new concept of the importance of land and of the need for keeping the land permanently productive. No longer do we, in our thinking, planning, and action (work on the land), put farmland erosion off in one pigeonhole by itself, forest depletion in another, or floods and siltation under one heading and wildlife depletion under still another.

These are related things. Nature's laws were so contrived that land, water, plants, and animal should—and under natural conditions do—exist in harmony and interdependence for perpetual productiveness. It is like mandate of nature that the land must be treated and used according to capability and need if it is to endure. This law of nature, man too often has overlooked while busy with his daily affairs, or has entirely failed to understand because of confusion, war, and greed. The practical application of this principle is being demonstrated today on a progressively wider scale from year to year all over the Nation, through the Nation's soil and water-conservation program.

The program of the Soil Conservation Service was developed out of a balanced relationship that exists in nature among land, water, plants, animals, and climate. Productive land, with the water that enables it to produce, is the one basic resource without which we cannot live. Without it there can be no life as we know it—except marine life—no forests, no food and fiber crops, no grass or other plant life. Recently we have even drawn on the life-giving soil for certain "miracle" drugs which science has developed as a further boon to mankind. Moreover, productive land is the source of the major part of all our wealth.

A large share of our scientific endeavor is directed in some way toward improving

man's welfare—his health, his comfort, his wealth, or other needs or satisfactions in life. Scientists, therefore, are concerned about the land of the farmers' fields—although it was not always so. They are concerned, also, about our timberlands, our grasslands, and our marshlands. Except for fish, we are dependent on the land for the food we eat, for a very large share of our clothing, all our wood, and for many other things. Hence our most noteworthy scientific advancements in such matters as, for instance, crop and livestock improvement, or disease and pest controls, can be of limited worth at best if the productive land base of our plants and animals is not safeguarded.

PRODUCTIVE LAND UNLIKE OTHER RESOURCES

Productive land is unlike other natural resources such as mineral ores, coal, and oil. It is characterized by the element of life—fruitfulness—placed by nature in the thin mantle of productive soil occurring over a limited portion of the earth's surface. This life-producing quality, and the water that makes it so, in a sense, set land off in a category by itself. Productive land is further differentiated from other natural resources in that it must be used and maintained simultaneously. All other natural resources, with very few exceptions, must be taken from the earth—separated from it—in order to be used by man. And their utility, in large degree, calls for complete transformation, as iron ore into steel, and coal and petroleum into warmth and power.

Productive land is much more limited than has commonly been supposed. It occurs only on the surface of the earth and only on part of this surface. It is not permanent—it is not a renewable natural resource. It cannot be stockpiled or shipped in from other countries like rubber, tin, or copper. Once the fertile topsoil is washed or blown away, it cannot be restored or replaced in any practical way for generations. And what is left—subsoil—usually is far less productive, less stable, and less absorptive of rainfall. There are no substantial undiscovered reserves of production land anywhere. And we cannot dig deeper into the earth and find new productive soil. We cannot pump it from wells, plant it with seeds, or dig it from mines. We must keep what we have or do without.

We occasionally hear loose discussions of the practical possibilities of remaking topsoil from ray, erosion-exposed subsoil. In my opinion it cannot be done short of geologic time. Subsoil can, in many instances, be improved, of course, by growing grass and legumes, for example and by adding manure, compost, lime, fertilizers, and so on. Sometimes following such treatment good crop yields are obtained, but this is a matter of improving the subsoil, not of making new topsoil. I have spent a lifetime, as a practicing soil scientist, studying the soils over much of the United States and in other parts of the world. These studies support but one conclusion—that topsoil is one thing and subsoil is another.

SOIL CONSERVATION REQUIRES TECHNICAL SKILLS

All of which brings us to the further premise that we must treat and use our remaining limited supply of productive land in a way that will at once protect it and increase its productivity by conserving the soil itself, its available elements of fertility, and all that man and nature have put into it. This conservation of our remaining land and water resources is the most important problem confronting American agriculture, and it is not a problem that can wait until farmers solve it by some trial-and-error method, for that might easily be too late. This is an urgent problem that demands the best efforts of the Nation's scientists and of all who farm the land. It is a job that requires scientific knowledge, technical skill, and understanding cooperation.

It is true that many soil-conserving measures, especially annual farm practices, are so simple that farmers need no direct technical assistance in applying them. Putting lime or manure on the land, weed control, and growing protective cover crops are among those good farming measures that usually involve no particular difficulty and call for little or no technical help. But the principal soil conservation methods generally are used in combination with one another, and each must fit the land in a properly coordinated pattern to be effective and enduring. Based on painstaking scientific research and on wide practical use, such measures must conform in their application with the principles of hydrology, engineering, and agronomy. Under varying conditions of climate, topography, and drainage, the wrong thing done—or the right thing left undone—on any part of many farms can do serious injury to the entire farm.

Clearly, then, the over-all job of conservation involves such complex problems as erosion control, drainage, improvement of soil fertility, woodland management, control of running water, and wildlife conservation. But most farmers are not specialists in these fields, any more than they are their own doctors, lawyers, and dentists. Soil and water conservation is a job that demands the skill and knowledge of experienced technicians who have special training in the art and science. Experts trained in the specialized fields of agricultural science make up the personnel of the Soil Conservation Service, which makes virtually all its assistance to farmers available through the farmers' own soil conservation districts, and at their request.

At this point, I think it would be well to consider for a moment just what we mean when we talk about modern soil conservation. Modern soil conservation is based on sound land use and treatment of land with all the proved appropriate measures that will keep it permanently productive while in use. It means terracing land that needs terracing; and contouring, strip-cropping, and stubble-mulching the land as required, along with supporting practices of crop rotation, cover crops, green-manuring crops, and so forth, wherever needed. It means gully control, stabilizing water outlets, building farm ponds, locating farm roads and fences as nearly on the contour as practicable, planting steep, erodible land to grass or trees, development of good pastures, and devoting good management to them after they have been developed.

Modern soil conservation consists of doing all these and still other things. Where land is too wet, modern soil conservation calls for drainage, with full consideration given to wildlife needs; if it is too dry, it calls for irrigation; if it is subject to wind erosion, it calls for wind-stripping, tree planting, growing cover crops, and stubble-mulch farming. If plant nutrients, lime, and the humus supply of the soil have been depleted, it calls for fertilization and addition of lime and organic matter, if water-soluble salts have accumulated in toxic quantities, as often happens in parts of the West, it calls for drainage and leaching out of the salts by flooding. Modern soil conservation calls also for the use of the best of the most adaptable varieties of crops, as well as the most efficient of adaptable tools available to farmers.

It likewise includes, for flood control and reservoir protection, treatment of whole watersheds with the right combinations of practices, land use, and small structures in the smaller watersheds where floodwaters start. Applied at the right time and place, such watershed treatment saves soil and reduces flood and sedimentation damage, puts water in the soil for plant use and, where conditions are favorable, in ground-water reservoirs, and otherwise benefits general farm, industrial, and municipal water users.

And, of course, an indispensable part of modern soil conservation is a support program of research that will provide for the welfare of the land at all times and provide farmers with the advantages that progressive science can contribute. Also, a continuing, vigorous program of soil conservation education should be made a part of our teaching, probably from kindergarten on through college. Moreover, modern soil conservation calls for the continued maintenance of all effective work which is put on the land, not just for a single year or cropping season.

In short, there is only one correct formula for doing the soil and water conservation job—a formula consisting of treating the different kinds of land on a farm according to their individual need or condition, and using each kind according to its capability for continued safe and economical production.

Carbondale Centennial Celebration

EXTENSION OF REMARKS

OF

HON. HARRY P. O'NEILL

OF PENNSYLVANIA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. O'NEILL. Mr. Speaker, under leave to extend my remarks in the Record, I wish to include the following article concerning the Carbondale, Pa., centennial celebration, from the *Scrantonian* of Sunday, September 23, 1951:

SIXTY THOUSAND SEE PIONEER CITY END JUBILEE—RODEO, PUBLIC DANCE AT CITY HALL CLOSES WEEK-LONG CELEBRATION

(By William J. Carey)

Celebration-conscious Carbondale wrote a slam-bang finish to its first 100 years as a city Saturday afternoon by staging the biggest and most colorful parade ever witnessed in the Up-Valley before a turn-out estimated by police at more than 60,000.

With labor, industry, and veterans' organizations collaborating, the 90-minute march through Central City streets went into the history books as a fitting tribute to the community which now begins another century of progress and development.

The occasional rain-threatening clouds, which appeared in the skies as the parade began, were offset easily by the festive spirit prevalent throughout the city. The centennial weather record remained intact during the afternoon, giving the community seven full days of ideal weather without the slightest drop of rain.

High-lighting the stirring march were musical units from the American Legion and Veterans of Foreign Wars posts from all sections of Pennsylvania as well as high-school bands in the county and local music-making groups.

Parading were members of Legion and VFW groups augmented by representatives of other service organizations, together with Carbondale's Gold Star Mothers.

Pageantry in its finest was offered in the dozens of floats presented by industrial organizations. The Delaware & Hudson and the Erie Railroads entered replicas of early predecessors of the modern locomotive.

Comedy was sprinkled liberally throughout the line of march. Two make-believe Indians, war paint, feathers and all, set the huge throng howling with laughter as they gave out with 1951, movie-version war whoops.

Another humorous incident was a Carbondale taxi concern whose exhibit included a horse-drawn buggy heralding the vehicle

as its first cab. On the horse's rear quarters was the company's phone number inscribed with red paint.

Spotlighted on a beautifully decorated float was Miss Kay Pope, a 17-year-old high-school senior, who reigned as centennial queen by winning a competition against 60 other Carbondale young women. She was surrounded by 16 court princesses and Grace Fotia Devita, contest runner-up, who was acclaimed "Miss Centurama."

The history-making parade was an impressive climax to the week-long celebrations which saw Carbondale's citizenry joined by thousands of area residents and out-of-State visitors, swelling the community's population considerably.

Last night the Pioneer City's business district was congested by the largest throng in its history as public dancing—modern and old time—was enjoyed by thousands along a three-block area on Main Street, with City Hall as the midway point. Three orchestras were featured and selections ranged from Auld Lang Syne to Sweet Violets.

At Russell Park, meanwhile, an old time Western rodeo attracted a crowd of more than 5,000. The show, engaged by the centennial committee for a 2-day run, was augmented by a carnival which also reported tremendous business.

At the centennial headquarters, Fred L. Lang, special events chairman for the anniversary programs, reported the entire project is a solid financial success.

Lang said that it will be several weeks before an audit will be completed and the fiscal report made public.

A portion of the cost of the centennial undertaking was raised through the public sale of stock certificates selling at \$1 each. It is understood that stockholders will be returned a goodly portion of their investments.

Pioneer City hotels and taverns last night were turning away prospective patrons in droves. One businessman described the trade "as the heaviest ever seen in Carbondale." Patrons at bars were lined 10 deep and back room tables were something only an idiot would attempt to find available.

The centennial festivities attracted visitors from all over the world—some from Greece, Italy, England, as well as hundreds from virtually every State in the Union. Mayor William L. Monahan's city hall once was the Mecca of most of the visitors and the city's chief executive undoubtedly set some sort of a record for hand-shaking during the week.

While the community's vehicular and pedestrian travel also established new records, police reported an astoundingly low number of violations. Only one man was arrested on a suspicion of pickpocketing, but the charges were dismissed. In a lone vehicle mishap, three Eynon women were slightly injured Thursday night.

The Up-Valley community was scheduled to resume normalcy today, but judging from the celebrating mood of the populace during the wee early hours of this morning, it appeared unlikely that the town will get back on an even keel until Monday.

Censoring Television

EXTENSION OF REMARKS OF

HON. THOMAS J. LANE

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. LANE. Mr. Speaker, under leave to extend my remarks, I wish to include

the following article by the Most Reverend Richard J. Cushing, D. D., archbishop of Boston, Mass., which appeared in the Boston Sunday Advertiser, September 23, 1951:

SOME TELEVISION PROGRAMS SHOULD BE BARRED FROM SCREEN

(By the Most Reverend Richard J. Cushing, D. D., archbishop of Boston)

With television starting its biggest season, innumerable letters of complaint from angry and indignant parents already are arriving at my office pointing out that some television programs have sunk to a new low in breaking the laws of morality and decency.

These parents want to know what action they must take to halt this serious menace to America's morals and how to protect their children against the evils of television.

At the moment, there seems to be only two things left for parents to do. Fathers and mothers must immediately impose rigid censorship restrictions in the home over indecent, immoral, and downright filthy television programs, or be guilty of committing serious sins against the laws of Almighty God.

Secondly, parents must write letters of protest to the sponsors of such programs.

I am not going to mention by name any programs in particular, or any personalities. The offenders, and the public itself, should know to whom I refer.

In general, I speak of programs where semi-nude women are depicted in "angle" close-ups followed by insipid "wise remarks" by comedians too unskilled to be entertaining by sheer good humor.

I speak of programs where the sacredness of the home and the family is held up to ridicule with immoral remarks by ill-bred comedians. I speak of programs which portray everything indecent in life, but fail to afford any moral to better living.

I speak of the many programs featuring suggestive dances; the programs featuring comics with disgusting gestures. I speak of the horror programs which glamorize murder.

Imagine children hovered about a television set, eyes glued to all of this filth and horror.

Imagine children seeing the sacredness of womanhood being defiled before their eyes by the dress, the actions, and remarks of a seminude woman aided and abetted by a sleazy comedian's suggestive repartee.

Would the sponsors permit their own children to view this filth? It seems highly improbable.

And what of the entertainers themselves? Would they condone such actions by others before their own children?

What has happened to the television industry? It seems tragic that a medium which could—and to a degree does—afford an avenue for so much that is good and uplifting in this world, is permitting a false concept of entertainment to lead it so rapidly toward official censorship.

One of the New York newspapers recently devoted an entire double spread in color to forecasting what is in store for television viewers this fall.

To quote the article: "Video, where sex appeal must be put across in close-up shots, faces the problem of estimating how far below 'see' level female performers may take the V-neckline plunge."

Some sponsors, program directors and entertainers themselves evidently believe that the secret to success in the television field is to make the program as filthy as possible.

If these so-called television experts could read the mail from an irate public, they would soon change their point of view.

Even adults who wouldn't blink an eye at such carryings-on in a night club or on the musical comedy stage, bitterly resent the

same type of material when it is presented in their homes for their children to see.

And it all seems so unnecessary. Television, a fascinating medium in itself, certainly can provide adequate and popular entertainment for adults and children alike without pandering to the lowest animal instincts.

Until television came along, the fashion in entertainment was to feature indecent poses of women's legs. Now that fad has appeared to be passé and the emphasis is being placed upon the neck line.

Several months ago I pointed out the harm television was doing to itself by not censoring its own programs. I pointed out that this great industry was preparing its own way for inevitable official censorship.

Today my predictions are that much nearer an actuality. It seems regrettable, because no one wants censorship for any industry unless it becomes absolutely necessary.

There are television programs that do credit to the industry. These programs, and they cover a wide field of music, dancing, comedy, drama, mystery, etc., prove that television—if directed wisely—can accomplish wonders not only from an educational and religious standpoint—but also as a truly entertaining medium.

One thing remains certain: the television industry is destined to suffer by its own mistakes through an aroused public whom it is trying desperately, but erroneously, to satisfy.

For the time being we recommend rigid home censorship of television and extensive protests to the firms that sponsor these immoral programs.

Golf's Vagaries

EXTENSION OF REMARKS

OF

HON. RALPH A. GAMBLE

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. GAMBLE. Mr. Speaker, under leave to extend my remarks, I include the following article entitled "Golf's Vagaries," published in the Daily Times, Mamaroneck, N. Y., September 19, 1951:

GOLF'S VAGARIES

Although Joe Gagliardi of Winged Foot Club in Mamaroneck did not win the national amateur golf championship, Westchester is proud of how close he came. He was the first Westchester player since Willie Turnesa, of Elmsford, to reach the finals, and a defeat of 4 and 3 in 36-hole play is close.

We don't believe in alibis and have none to offer in extenuation of the Westchester's defeat on the Pennsylvania course. And we think it sportsmanlike that although Mr. Gagliardi was suffering with an abscessed tooth which required treatment between tournament matches, at no time did he mention this as an excuse, and it was only learned from other sources after close of tournament play.

But, as a side issue, we might call attention to the fact that here in Westchester's climate about the best any golfer can do is play for 6 months of the year, whereas in the South and Southwest play the year 'round is possible. Too, we imagine that Mr. Gagliardi as the father of five youngsters has a few domestic responsibilities not incumbent upon his more youthful adversary.

Golf, after all, is a funny game. Temperament—and temper—along with psychology, digestion, reflexes, vision, coordination, personal habits, and age—all of these have a

direct bearing upon how well one plays the game.

Notice, for example, that Mr. Gagliardi in his earlier rounds knocked off such giants of the greens as the 1950 champion and the 1949 champions and the junior national champion, only to go down before a comparative unknown in the final round. Golf, we repeat, is like that.

For these and other reasons, we emphasize that Westchester has full reason to be extremely proud of its representative at the national amateur tournament.

And yet, lest the rest of America be under the misapprehension, let it be mentioned that between winning the metropolitan amateur championship and going to the finals in the national amateur championship, Mr. Gagliardi failed to survive even the early rounds of the Winged Foot Club championship.

In other words, the woods of Westchester are full of good golfers. And, so that we may not appear too boastful, they are also full of poor players. That's what makes golf so interesting.

Statisticians say that there are more than 300 kinds of ball games. Most of us, we are sure, have seen at least 800 different kinds of games played with golf balls.

The Katyn Murders

EXTENSION OF REMARKS

OF

HON. RAY J. MADDEN

OF INDIANA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. MADDEN. Mr. Speaker, two speeches by members of the new Select Committee To Investigate the Katyn Forest Massacres have already broadcast the information of its organization behind the iron curtain. The testimony and evidence to be gathered on these mass murders will further reveal to the world that Russia's leaders possess criminal minds:

TALKING OVER THE CURTAIN

A campaign is getting started in Indiana to raise funds for the Crusade for Freedom, which finances Radio Free Europe in its broadcasts over the iron curtain. A question which will be asked frequently during the campaign is whether we know the broadcasts are being heard behind the curtain.

Radio listening in Russia and its satellite nations is restricted, it's true, and there are no Gallup polls to test whether the people are hearing Radio Free Europe. But there are concrete pieces of evidence which show being heard—and that they are making an impression on the people.

For one thing, there is testimony by word of mouth, gathered by correspondents of Radio Free Europe. There is evidence from those who have escaped through the iron curtain who say the messages are being heard and are developing resistance to the Communist overlords.

The antics of the Russian broadcasters themselves prove Radio Free Europe is becoming extremely troublesome to the Soviets. Why else would they make such frequent attacks upon it? Why else would they announce that all its German employees are to be executed when they liberate West Germany? And why else would the Communist press publish such vigorous attacks on it?

There is specific evidence in abundance. The broadcasts have been listing the names

of Hungarian political police. A refugee who recently escaped from Hungary reports that as a result, the regime now changes the names of the men and reassigns them to new posts as quickly as their identities are revealed by Radio Free Europe.

The Crusade for Freedom program will not do the whole job in Eastern Europe. It will not by itself bring about the liberation of the Czechs or Hungarians or others now under Soviet domination. But there is positive evidence that it is being effective in keeping the spark of freedom alive in those countries, and giving hope to the many who await the day when they can break the shackles of communism.

Katyn Massacre

EXTENSION OF REMARKS

OF

HON. THOMAS J. LANE

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. LANE. Mr. Speaker, under leave to extend my remarks, I wish to include the following:

EXPOSE MURDERERS OF 15,000 POLISH OFFICERS

We make speeches about Poland expressing our admiration for its heroic people and vaguely promising to help them regain their independence in the fugitive future.

American citizens of Polish descent, although thankful for our kind words, would feel better if we followed through with a little action for a change.

The mass murder of 15,000 Polish officers in the spring of 1940, their methodical liquidation in secret, and in brutal violation of the protection guaranteed to them as prisoners of war, is one of the most horrifying crimes in history.

After due process of law hundreds of Nazi and Jap war criminals were executed and thousands more imprisoned, but the cold-blooded killers of Poland's leaders have never been brought to justice.

Why?

Is it because—as in the United States itself—we are afraid even to point an accusing finger at gangsters and grafters who are powerful while we bear down heavily in the name of justice against the small fry?

Are we becoming the victims of our own double talk, recognizing crime only when it is convenient for us to do so and ignoring the more flagrant violations?

The moral leadership which we profess becomes a mockery and a hypocrisy as long as we "choose not to see" the extermination of 15,000 Polish officers done in a deliberate effort to murder a nation.

This reveals a fear of Red Russia.

And it is a confession on our part that we believe the Kremlin to be responsible for this massive atrocity.

In spite of recent examples to the contrary, most Americans believe in truth and honesty and heed the voice of their conscience. It is they who are insisting that all crime be investigated relentlessly and the perpetrators thereof be indicted even though they cannot as yet be called before the court of world opinion in this instance to answer for crimes which stagger the imagination.

A feeble effort was made at the Nuremberg war-crime trials in Germany, to get at the facts in the case of the Katyn massacre. But when it became evident that the accused Nazis at Nuremberg would be allowed to summon witnesses and documents in defense of the charge that they were guilty of this hideous crime and thus reveal the Red Rus-

sians to be the guilty parties, the Soviet representative suddenly moved to block any further investigation. This part of the general indictment was therefore withdrawn, aided and abetted by the craven compliance of our own representatives in that period when American foreign policy was turning itself inside out in order to appease the Communists.

In the final reckoning, it is the American people who decide right from wrong in the conduct of our own affairs and in our dealings with other nations, and not a select few in Government who think that vital information should be withheld from the people.

Already, as we piece together the bits of information that come to use over the efforts to conceal or play down certain facts, the evidence points more and more to the need for Congress to assume the initiative.

A report made by two American Army officers has become lost in the files of the Department of Defense or the Department of State. Mystery is being added to mystery.

Evidence from all sources—admittedly incomplete—shows that the Communists are guilty. There are several questions which they cannot answer, namely:

1. If the prisoners were being taken far beyond Smolensk, why did they disembark at Katyn?

2. If the murders took place in August 1941 and were committed by the Nazis, as the Russians allege, why did the prisoners have no mail, newspapers, or diary accounts beyond April 1940, and, why were the bodies of the prisoners dressed in heavy winter clothing?

3. If the Nazis were responsible for the massacres, why were the hapless Poles tied up and shot in a typically Russian manner never used by the Germans, why did the prisoners have wounds made by four-edged bayonets, used only by the Russians, and why were the victims tied with Russian-manufactured rope?

4. Why did the Russians know nothing of the fate of the Poles until after the German revelations, when they suddenly knew everything?

And why, above all, is the Kremlin afraid to permit an honest investigation on the scene?

We in the United States must not allow ourselves to be placed in the position of condoning this enormous crime against humanity by our silence. Eight years have passed, years in which we temporized, evaded, and otherwise failed to speak up for justice.

The familiar technique of delaying, in the hope that people will forget, will not work.

There is a restless undercurrent of protest that will not be satisfied until those responsible for this terrible savagery are identified and exposed to the contempt of the world.

To the credit of the Congress, it has passed, unanimously, House Resolution 390, creating a select committee to conduct an investigation and study of the Katyn Forest massacre.

This is a good start. I hope it will not wind up as an empty gesture.

No one, outside of the Politburo, wants war. The free world, after an overextended sleep, is starting to apply every measure short of war to stop the spread of Communist imperialism.

One of our best weapons is truth, carried home to the Russian people. If we plead the cause of justice and humanity and the right of every human being to be protected against the excesses of the State, we shall help to bring the Katyn murderers, who also hold the Polish and Russian people in bondage, ever closer to the day of reckoning.

While building up our physical strength, we should not overlook the influence of moral rearmament.

Unmask the crimes of the Soviet regime. Hearten the people of Poland and all others who look to us for something more than arms or economic assistance.

Find and accuse those who deliberately murdered the 15,000 Polish officers.

This will be the first step toward enlisting the cooperation of decent-minded people the world over in the struggle to make the Kremlin pay for its rape of civilization.

Thirty Dollars for Night Clubs and Thirty-Dollar Tax Bills

EXTENSION OF REMARKS

OF

HON. PAUL W. SHAFER

OF MICHIGAN

IN THE HOUSE OF REPRESENTATIVES

Monday, September 24, 1951

Mr. SHAFER. Mr. Speaker, President Truman recently set some sort of new record for glibness in talking about taxpayers and taxpayers' money. In the demagogic campaign speech he delivered at the dedication of the new \$25,000,000 Government General Accounting Office Building here in Washington, Mr. Truman said:

A man will go to a night club and throw away \$30 or \$40, and think nothing of it, but let him get a tax bill for \$30 and listen to him scream

I would not want anyone to give up his time-honored right to complain about paying taxes. If people couldn't blow off steam that way sometimes, they might explode.

This masterpiece of "logic" and rebuke to grumbling taxpayers suggests some interesting questions: Who is there left these days to enjoy the privilege of "screaming" about a Federal income tax bill of only \$30? How many persons with an annual Federal income tax of \$30 are prospective night club patrons—prosperity, that is, from an income standpoint?

The facts are that most any individual could earn under the 1950 Federal income-tax schedule and still get a tax bill of not more than \$30 is \$4,850 a year. But in order to have the privilege of screaming about a \$30 tax bill, that individual would have to list seven exemptions. Just how often, one wonders, does a \$4,850-a-year man, with a wife and five kids, throw away \$30 or \$40 in a night club and "think nothing of it"? Incidentally, if the House-approved tax boost is finally adopted—and it is less than Mr. Truman is demanding—the maximum annual earning figure in this example would be cut to \$4,800.

A married man with two children—four exemptions in all—could earn no more than \$2,850 a year under the 1950 income-tax schedule and still have the right to "blow off steam" about a \$30 tax bill.

A married man, listing only himself and his wife as exemptions, could have a \$30-a-year income tax only if his annual income did not exceed \$1,525. With that sort of income these days, a couple would not throw away \$30 or \$40 in night clubs often, even on their honeymoon.

A single man, with no dependents, might be regarded as the most likely prospect for the extravagant night-club flings the President was talking about. But even this carefree individual would

find his style severely crimped if the Government levied only a \$30 income tax on him because he could not have earned more than \$850 in 1950. Next year, under the House tax boost, the ceiling for a \$30 income tax will be lowered to \$825 in annual income for a single person.

Perhaps it could be assumed that a \$5,000-a-year man, with no dependents, is still able to "go to a night club and throw away \$30 or \$40 and think nothing of it"—if he were so disposed. But one thing is certain: That same individual would surely welcome the privilege of paying a \$30 annual Federal income-tax bill. Under the 1950 schedule, he actually paid \$724. If the House tax boost is adopted, he will pay \$846 in 1951 and \$915 in 1952.

Just where does Mr. Truman find any basis for talking about \$30 tax bills in the same breath with \$30 to \$40 night-club speecs?

The night-club portion of his remarks may accurately reflect the thinking and habits of Washington bureaucracy, though some of the recent disclosures of gifts of mink coats, hams, free hotel rooms, and deep freezes suggest that it is not the bureaucrats who pick up the check. But millions of hard-working, financially hard-pressed Americans rightfully resent the flippant suggestion by the President that they think nothing of tossing away \$30 or \$40 in a night club.

And even more millions of these Americans will be amazed at his suggestion that there will be many \$30 tax bills left to scream about under the night-club-style spending habits of the Truman administration.

With his remarks about the possibility of an explosion, however, I am in complete agreement. I am confident the blow-up will occur on election day, November 4, 1952.

What Are the Effects of Controls on Ethics?—Does the Passing of a Law Make a Moral Act Immoral?

EXTENSION OF REMARKS

OF

HON. HOWARD H. BUFFETT

OF NEBRASKA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. BUFFETT. Mr. Speaker, under leave to extend my remarks, I wish to insert the following article from the April 1951 issue of Faith and Freedom, written by Mr. Frank Chodorov:

THE MORALS OF CONTROLS

(By Frank Chodorov)

The impression is abroad that price fixing and wage fixing are economic matters. That is partly so. These controls—mark the word—aim to constrict human behavior, and human behavior is surely the concern of ethics. This should not be lost sight of in the welter of economic argument.

MORTALITY, POLITICS, ECONOMICS

An analogy is in order. When a robbery is committed, the victim is impoverished and the robber is enriched, and thus the act has

an economic aspect; also, it is political because punishment is involved. Our main concern with robbery is the injustice of it, and injustice is a moral concept. In like manner, controls are political because the law is involved. They deal with prices and wages, which are economic matters. Yet it cannot be denied that they direct themselves to human behavior, are intended to control it, and therefore must be treated from the point of view of morals.

The very word tells its story. What do these controls aim to control? Nothing but the way the individual orders his economic life. By its provisions for enforcement and punishment, the law concedes that it is in conflict with normal behavior. Furthermore, the extensive machinery set up for detection and punishment is an admission that the law does not have the approbation of public opinion. Putting it plainly, the law has written into the human being, in his pattern of thought and behavior, and evil that did not exist before the law was enacted. It proposes to root this newly discovered demon out of him.

To understand the character of this demon, we must apply ourselves to the nature of man, as revealed in his way of making a living, and there we find the pernicious habit of selling his labor (or labor products) to the highest bidder. Putting it in reverse, man is wicked because he offers more for his satisfactions than the law allows. That is what price controls imply.

Whence comes price? Since we see no evidence of it in the animal world, we must conclude that it is purely a human invention. And, mark you, it is a concept that appears only when men associate; a lone human on a desert island would never think of price. Price is a product of social integration, a habit of men that could hardly be termed immoral.

THE LAW OF PARSIMONY

He is an odd creature, this human being, in that he entertains a multiplicity of desires. All other living creatures are well satiated with a meal and a mate. The human, however, starts only with food, raiment, and shelter; from the modest beginning he climbs from one satisfaction to another until, at long last, he cannot get along without baseball and Bach.

There is a fly in the ointment; every satisfaction acquired by man entails an expenditure of labor. There is no other way, and because labor induces an unpleasant feeling of weariness and irksomeness, man is parsimonious about it, he seeks to satisfy his desires with the least expenditure of labor.

It is that law of parsimony that accounts for man's labor-saving devices. By far the most important of these devices is his indigenous system of specialization and exchange. Having learned by hard experience that very little can be gotten out of the job of jack-of-all-trades, man trains himself into proficiency at a particular trade and comes up with a greater abundance. But specialization is possible only when men live in communities. The shoemaker cannot wear all the shoes he makes, and the farmer would be in a bad way if he had to eat all his onions. There must be some way for the shoemaker to exchange his surplus for the surplus of the farmer. So, man invents a market place where the various specialists can exchange their respective abundances for their mutual benefit. The market place and society are synonyms. Whatever other impulse drives man to seek association with his fellow being it is a certainty that the prospect of improving his circumstances through specialization and exchange is an attraction.

HIGGLING AND HAGGLING

That is where price comes in. It is not germane to this discussion to go into the

intricacies of price, with which are involved the question of money and the theory of value. It is only necessary to remember that price is a result of the human inclination to satisfy his desires with the least expenditure of labor. It is normal for each specialist to ask more; it is normal for the opposite specialist to offer less. This is called the higgling and haggling of the market place. At some point in this normal process there is a meeting of minds, and at that point price is established. This normal way of doing things has now been declared abnormal by the law; it must be suppressed.

The principal function of price is to tell the various specialists how best they can serve one another. A high price gives notice that a need is felt and urges labor to make up the deficiency; a low price tells labor that it ought to apply itself to something else. Price is the automatic regulator of voluntary cooperation. It is the essential cog in the market place, and the market place makes possible the practice of association. If we take this practice as the starting point of all morality, then we must concede an important place to price in ethics. It is as much an ethical as an economic concept.

In itself, price is moral. It is mechanical. But, it is possible for man to manipulate this mechanical director, and if there is any immorality in the price mechanism it must be in the manipulation. When artificial shortages are created, the price indicator will record the fact, because it is automatic and mechanical; if there is anything immoral in the high price, it is in the creation of an artificial shortage. If the Government, which has a monopoly of making money (the agreed-upon measuring stick the price), increases the amount of money in circulation, then price becomes deceptive; just as a yardstick is deceptive if somebody should surreptitiously snip off an inch or two. The deception, not the price, is immoral. In either case (artificial shortages or the creation of new money), the price indicator goes up and labor is required to give up more to acquire less.

Right now, shortages are being created by the diversion of production to war purposes. At the same time, to finance war and other governmental ventures, money is being created by the printing-press process. Price is therefore going up. There is a general feeling of hurt because it takes more effort to satisfy desires or because certain desires must be abandoned in order to satisfy the basic ones. That general feeling of hurt is what we call social unrest, and the Government is trying to assuage it by throwing the blame on price. The waste must continue, more money (or bonds) must be printed, and yet, price must be held in leash.

TO LOCATE THE DEMON

The insatiable human appetite for a richer and fuller life clashes with the pattern of behavior demanded by law. The conflict arises despite the best intentions of the citizenry to be law abiding. In one way or another the evil in man will show itself in the market place, and every expression of it will call for more and more restrictions on human behavior: Wage controls; rationing; allocations; job-freezing, warehouse, and pantry investigations. The moralist cannot help asking himself: Is there a demon in the human being that must be driven out of him, or is the demon in the constrictions?

In physics we recognize a constant cause-and-effect relationship which we call the law of gravitation. We learn about it by watching nature. The apple always falls downward, and we assume that it will never fall upward. We don't monkey around with the law of gravitation because we have found by experience that it is fatuous to try it; step-

ping off high places invariably brings results. Not even Congress can change that.

RUSSIA OFFERS A LESSON

In economics and in morals we have not yet gotten around to identifying such invariable relationships. In these fields we hold that political force can manage everything. It is within the power of the policeman, we believe, to mutate man into the image of a plan, provided the policeman's club is big enough and he is capable of wielding it. And we stick to this conviction despite the evidence of consequences. Nowhere has this theory been put to greater test than in Russia; there the constrictions on human behavior have been implemented with the severest of police measures. Nevertheless, even the commissars have admitted the existence of a black market and have been compelled to officially recognize it. Their experience ought to warn us that controls do not control.

WHAT MADE IT BLACK?

What is the black market? It is not a place; it is a state of mind resulting from an invariable in human conduct. It is the same state of mind that existed before the law made it black. The butcher always wanted the highest wages for his services, and the housewife always offered him as little as she had to get meat, but now, thanks to the war effort and Government fiscal measures, there is a shortage of meat and a plentitude of money; a lot of housewives are bidding for the small supply and she must go along or her family will go without meat. The butcher's helper always considered himself underpaid, just as the butcher always considered him overpaid; now, rather than close up shop or work harder himself, the butcher must compete with the armament plant for the services of the helper. Buyer and seller, employer and employee, all acting on the normal impulse to get along in life, keep pushing one another into a perfectly natural, though illegal, arrangement.

AN AGE-OLD PROBLEM

Is the black market, or the state of mind underlying it, immoral? If we admit that, we equate morality with legality. If we say that there is no good or bad but what legislation makes it so, the ten commandments would be without validity until sanctioned by Congress.

It is a noteworthy fact that the black market rests on behavior that in ordinary circumstances we esteem and commend. On the other hand, the black market encourages practices of an immoral nature, law or no law. It brings out the worst in us. Deception, falsification of reports, compelling the buyer to pay an exorbitant price for something he does not want in order that he may get what he does want at the legal price—all such practices are repulsive to our innate sense of decency. A lie is a lie and no law can make a moral person out of a liar. If we try to exonerate the liar on the grounds of necessity, we condemn the law that makes lying necessary; we imply that the immorality is in the law.

Another black-market practice that conscience cannot condone is the bribery of officials. The enforcement agent is, after all, only a human being; like everybody else, he is ever intent on improving his circumstances with the minimum of labor. The law presents him with opportunity. We might say that he ought to be above temptation, but censure is tempered by the dictum that only those who are without sin are justified in casting stones. Bribery is wrong, not because the law says it is, but because the briber pays for nothing except permission to break the law. Our conscience, not the law, stamps the transaction as unjust, immoral.

But, if morality has any roots deeper than the law, judgment on bribery must take into consideration the law that makes it possible.

Perhaps the doctors of theology who have proficiency in the field ought to apply themselves to the morality of economic controls. For the ordinary person, seeking to adjust his inner compulsions to the dicta of the law, the problem defies solution. Does the law take precedence over the will to live? It is an old problem, one that has plagued man since he began making laws. It will be recalled that Caesar found the Jews very difficult, not because they refused to recognize his authority or failed to pay him tribute, but because they denied his divinity. Higher than Caesar was God.

Caesar has now decreed controls; are they moral?

"A Lot of People in the United States May Not Know That a Lot of Air Force Fellows Like Me Are Way Up Front Directing Sabre Jets and Other Air Ships Supplying Close Support to Infantry—We Radio the Pilots Where the Targets Are and Send Them in To Get the Communist Chinese and North Koreans"—
Corp. Richard F. Webb, Battle Report, Washington

EXTENSION OF REMARKS

OF

HON. FRANK W. BOYKIN

OF ALABAMA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. BOYKIN. Mr. Speaker, I am handing to the House reporter a copy of the fifty-second Battle Report, Washington. This is the National Broadcasting Co.'s teledocumentary projected weekly over their network and coaxials by Dr. John R. Steelman, the Assistant to the President, and such other public officials as he, each week, brings to the television screen.

The purpose of Battle Report, Washington, which Dr. Steelman projects, is to have various top-flight governmental officials make personal reports with respect to their individual activities to the people of the United States.

Mr. Speaker, during the recent recess of Congress, I was unable—while in Mobile—to introduce the tremendously important statements which were made on Battle Report, Washington into the CONGRESSIONAL RECORD. In consequence thereof, I have received more than a dozen letters asking why I did not continue to insert these reports in the RECORD. These letters came to me from both men and women located in areas in the United States not yet reached by television, while others were from people who received the CONGRESSIONAL RECORD but who have no television sets. All wrote to tell me of the great interest which they find in—and the appreciation they have for—Dr. John R. Steelman's weekly telecast. Several declared, in substance, that the Battle Report, Washington program was, to

them, the most interesting and informative material carried in the CONGRESSIONAL RECORD—apart from the recordings of the actual procedures in the House and Senate itself.

In the weekly telecast made on August 24, Dr. Steelman brought to the television audience, the Honorable John Allison, conference deputy to John Foster Dulles at the Japanese Peace Conference in San Francisco; Maj. Gen. George E. Armstrong United States Army; the Honorable Charles Brannan, Secretary of Agriculture, Brig. Gen. Marshall Roth, United States Air Force; and Corp. Richard F. Webb, United States Air Force.

In the course of his remarks, Mr. Allison, who opened the program, declared:

I have noted that at some point in every Battle Report, Washington there comes a time to talk of peace—for peace is the ultimate objective in all battles of all wars.

Mr. Allison then went on to outline the tremendous benefits that will accrue to the world by virtue of the Japanese Peace Treaty—effected after 4 years of war and 6 years of occupation.

He pointed out that democracy cannot be imposed from without, that it must come from within. He said that we must give the Japanese the opportunity to let democracy grow, that while the Soviet Union talks loudly and longly of peace, when the time comes to make peace, it draws back.

It claims to be—

He continued—

the champion of anti-imperialism and anti-colonialism, but when the time comes to make a great Asiatic nation free and through a peace treaty to bring to an end the government of one people by another—it holds back

Dr. Steelman's next guest was Maj. Gen. George E. Armstrong, USA—who discussed in detail the medical service rendered to our fighting men in Korea. His talk was accompanied by motion pictures—which showed the Army medics giving first aid to the wounded men while under enemy fire—gyroscopes and MATS' C-47 transport-type aircraft picking up the wounded on the battle-front—transporting them to the base hospitals behind the lines.

The only criticism I heard of the Medical Service, at any time—

General Armstrong told the audience—

was the oft-repeated phrase that "the medics are too daring and take too many chances with themselves."

Mr. Speaker, in common with General Armstrong, I say that if this be a criticism of the Medical Corps—it is a criticism which I fervently hope will forever and always be pointed at the United States Army Medical Service.

The report of Hon. Charles E. Brannan, Secretary of Agriculture, gives assurance to every man in this House that we may be sure that everything that we are doing in behalf of the democratic countries of Europe by way of lending aid and assistance to keep them free and independent is highly appreciated.

Secretary Brannan's report—brief and candid as always—on conditions in England, France, the Netherlands, Holland, Belgium, West Germany, and Yugoslavia, all of which countries he visited—gives assurance to the Members of this House that we have true firsthand advices of a type that will enable Congress to legislate wisely—as well as with precision, economy, and dispatch.

Of more than passing interest was the wonderful talk of Brig. Gen. Marshall S. Roth, United States Air Force, Assistant Deputy Chief of Staff for Development. General Roth's statement that "tomorrow's victories in the air are being won today in the Research and Development Laboratory. American industry and science, together with the research and development facilities of the Air Force are presently engaged in a challenging battle. The ammunition in this battle is scientific and technical know-how" certainly gave to the viewers—listeners of Battle Report, Washington, on August 24, an insight into what had and will in the future be accomplished in the use of weapons.

It was President Truman in his endeavor to force peace upon the aggressors who made the statement that—"the United States now possesses weapons of such magnitude and so fantastic that they could destroy civilization."

General Roth spoke in some detail about the work that was being carried on at the various Research and Development Centers of the Air Force—located in diverse parts of the United States. It is not surprising to learn subsequent to General Roth's disclosures as to what is being accomplished by current research studies, why the Air Force, just last week, established a combat unit for handling and using pilotless aircraft in battle combat.

Mr. Speaker, I would particularly direct the attention of my every colleague in this House to the splendid work that has been accomplished under the direction of the Chief of Staff and the Deputy Chief of Staff for Development, United States Air Force. It is the type of work being done by these units that will positively secure the defense of this Nation and the peace of the world against aggression * * * and do so with a minimum of cost to the taxpayers of these United States.

You know, Mr. Speaker, few Battle Reports, Washington are ever telecasted without including on the program one or more of the enlisted personnel of our armed services—the Army, Navy, Marines, or Air Force. These men are brought to the screen to tell us, in their own words, of their personal experiences. I doubt very much if any person who ever talked to the American people over television told a more fantastic tale than that recited by Corp. Richard F. Webb, of the United States Air Force.

Robert McCormick, the NBC commentator, in presenting Corporal Webb, stated that:

The entire garrison at Bolling Air Force Base here in Washington turned out this afternoon to see a 19-year-old Korean war veteran—with one of the most weird true stories yet to come out of the war—honored with the Purple Heart and Silver Star—That you may hear from his own lips his almost in-

credible tale, here is Air Force Corp. Richard F. Webb.

Corporal Webb responded in like language by saying:

A lot of people in the United States may not know that a lot of Air Force fellows like me are way up front directing Sabre jets and other air ships supplying close support to infantry. * * * We radio the pilots where the target are * * * and send them in to get the Communist Chinese and North Koreans

The rest of the corporal's story—about how in 1947 after an injury a titanium plate about the size of a silver dollar was placed in his head—about how, recently, in the dead of night 12 Koreans surrounded him—knocked him flat on his back—stomped a foot on his throat—and pulled the trigger on a rifle.

Read his statement—of how the bullet entered his forehead—glanced off that metal plate inside his head—and of how, when he was picked up by the medics, it was found that he had been jabbed by a bayonet which had glanced off his shoulder blade. That is only part of the story. His subsequent experiences—even more hair raising—are all authenticated, and he is now back in the United States all O. K.

Mr. Speaker, I have on several occasions taken opportunity to tell of the tremendous Nation-wide interest exhibited in this television broadcast, Battle Report, Washington, and I again repeat that this Nation is to be congratulated upon having a public official busied as is a man such as John Steelman and a corporation such as the National Broadcasting Co.—whose interests in public affairs are such that they bring to the Nation, at great cost and personal sacrifice of time, the wonderful information sent over the air each Sunday under the title, "Battle Report, Washington."

In order to make this more available to the American people, I again ask unanimous consent of my colleagues to extend my remarks and include therein as part of the extension, the fifty-second Battle Report, Washington, as it was telecasted over the National Broadcasting Co.'s network and coaxials.

The producer-director of this program is Ted Ayers; the production assistant, Jean Montgomery; technical director, L. A. McClelland; commentary, Robert McCormick; script by Lou Hazam; film editor, Bill Brooks; floor manager, Joe Tully, art director, Joseph Ferrier; and sound by Jim Martensen.

BATTLE REPORT, WASHINGTON, NBC TELEVISION, AUGUST 24, 1951

Mr. McCormick, in a week that has seen two conferences vital to world peace collapse—these British-Iranian oil negotiations and the Korean peace talks—NBC Television News brings you its fifty-second report on the battle against world communism.

Washington—where the Senate put itself on record, 81 to 0, urging boycott of Communist Czechoslovakia until it frees American newsmen William N. Oatis

On Battle Report tonight—a top report on where we stand on the forthcoming Japanese Peace Treaty Conference in San Francisco—the Surgeon General of the United States Army, who was checking up in Korea only 9 days ago, the Secretary of Agriculture, just back from a tour of Europe, an up-to-the-minute summation on what we're doing

about the development of new air weapons, and an airman just decorated a few hours ago for bravery on the ground. But, first, the Assistant to the President, Dr. John R. Steelman.

Dr. STEELMAN. Good evening, ladies and gentlemen, as you all know, two very discouraging events have taken place during this week. Negotiations for the peaceful settlement of disputes, in both Iran and Korea, have been suspended. It is a critical hour, calling for all our reserves of patience, firmness, and determination.

Meanwhile, men are still fighting and dying in Korea.

At Kaesong, it is not difficult to surmise what goes on behind the scenes in the Communist camp, to picture the evil schemes being hatched by the enemies of freedom. We have seen their obstructionist tactics many times since 1945 delay the realization of genuine world peace. We have listened to their distortions, their evasions, and their downright lies. It has long since become evident that Communist negotiators aim not only to deceive the outside world but also their own people. They aim to make the slaves and dupes who carry the burden believe that their rulers really want peace when world disorder is their goal.

But, regardless of what tactics are used, we of the free world will continue to strive to build a peaceful world. We will continue our aid and cooperation to all nations who seek it, in the age-old battle against hunger. We will continue to build our military strength and to improve it by study and research—and will work tirelessly to provide the best of care to all our men in the field.

During the next 2 weeks treaties with the Philippines, Australia, New Zealand, and Japan will be signed. At San Francisco, of course, the Soviet delegates will attempt to delay the signing of the Japanese Treaty by their well-known tactics. You will have an opportunity to see them on your television set. But the treaty will be signed, and an era of friendship and equality between east and west will begin.

Tonight you shall hear from the men who are foremost in these struggles for peace. They will report progress. And, in spite of the grim picture we see tonight, their work will continue until all men can know a world of peace and plenty.

Mr. McCormick. Japan—at the height of World War II.

And here—convinced of Japan's defeat only a few weeks ago—these Japanese soldiers finally surrender and are flown to Tokyo—just in time for the peace treaty conference that will get under way in San Francisco September 4. Soon to leave with the United States delegation to that peace conference, is our next guest. With a career in the Far East that goes back some 25 years—much of it spent in Japan before and after the war—he will serve as the conference deputy to John Foster Dulles. For some pertinent observations, then, on the forthcoming Japanese Peace Conference, here is John Allison.

Hon. JOHN ALLISON. At some point in every battle report there comes a time to talk of peace, for peace is the ultimate objective of all battles and all wars. The time has now come to talk of peace with Japan. The United States has issued invitations to 50 nations to come on September 4 to San Francisco to conclude and sign a peace treaty with Japan. In cooperation with the United Kingdom a draft of a treaty has been forwarded to all of the nations invited to San Francisco and it is this treaty which will be before the delegates to that Conference. This is not the product of any single person or single country. All the nations in the war against Japan have had an opportunity to make suggestions regarding this treaty and many of them have done so. Everyone has

had his say and now the time is approaching when words must be translated into action.

After 4 years of war and 6 years of occupation, it is time for Japan to be brought back as an equal, sovereign member of the family of nations. It is important to all of us that the 83,000,000 Japanese with their vigor, their willingness to work and their knowledge of modern industrial techniques, be given an opportunity to contribute to the economic recovery and the political stability of Asia. It is important that Japan become a dependable member of the free world, but this must be done on a voluntary basis. The free world does not operate by compulsion. It does not want slaves. Only the free choice of the Japanese people to throw in their lot with the free world will be of importance. We do not want to, in fact we cannot, force them to do so.

The treaty therefore which will be before us at San Francisco is a treaty of reconciliation, a treaty of opportunity. We have learned by bitter experience that treaties of vengeance, that treaties which impose upon the vanquished, conditions which the victors would not accept for themselves, become merely scraps of paper. The treaty we expect to sign at San Francisco is one based on reality and on trust.

It is not a perfect treaty. Those of us who have been most closely concerned with the development of the treaty know perhaps better than anyone else its faults. It is a human document bringing together the ideas of many men and many countries. No one, least of all the United States, will be perfectly satisfied. All nations who participated in the drafting of the treaty will be able to see evidences of their work. All can agree that if not a perfect treaty, it is a good treaty.

Is Japan ready for a treaty of reconciliation and trust? Is Japan a democratic country? Only time can tell. We can point out that after 6 years of occupation, over 80 percent of the farmers of Japan own their own farms. While before the war the figures were almost reversed; there are 6,000,000 members of trade unions in Japan today as against some 400,000 before the war, women have the vote and are taking interest in political life; there is a free press; the Japanese Parliament is no longer a rubber stamp but made up of active representatives of the Japanese people. These are the results of the occupation which will last and which make it possible for true democracy to grow. Democracy cannot be imposed from without. It must come from within. We must give the Japanese the opportunity to let democracy grow.

The Soviet Union talks loudly and longly of peace, but when the time comes to make peace it draws back. It claims to be the champion of anti-imperialism and anti-colonialism but when the time comes to make a great Asiatic nation free and through a peace treaty to bring to an end the government of some people by another, it holds back. If peace is wanted, here is an opportunity to get it. The treaty we are inviting the nations to sign will restore peace. It gives Japan back to the Japanese. It threatens no one. We hope nations who really want peace join with us in signing this treaty in San Francisco.

Mr. McCormick. Korea is far from "just simmering"—as these pictures prove. With American battle casualties passing the 81,000 mark this week, latest reports from the front indicate renewed Allied attacks—most of them designed to take vital hills overlooking enemy positions. Southern Koreans, in a 5-day battle that won approval from General Van Fleet for their gallantry, took an important Communist ridge that dominates the area north of Yangu. As one of them put it afterward, "We can now look down the throats of the Communist forces for miles." Meanwhile, the Air Force continued

to attack the enemy's massive motor truck supply effort. Our next guest has but recently returned from talking to the wounded in the combat areas of Korea, and checking up for himself on medical services rendered them all along the line. That you may hear his impressions first-hand, our cameras now turn upon the Surgeon General of the Army, Maj. Gen. George E. Armstrong.

Major General ARMSTRONG. I am very pleased to have this opportunity to discuss the Army Medical Service as it is functioning in Korea in its ultimate mission of rendering medical care for the fighting soldier. Just 9 days ago I left the Far East filled with pride for the wonderful work being done by the men and women who comprise the Army Medical Service in Korea. With each passing day this pride, if anything, grows within me, and will, I know, for me, be a lasting reminder of the unselfish devotion to duty of all those who are bound together by the tradition of military medicine.

During my tour in Japan and Korea, I was fortunate to meet and talk with almost everyone of the senior commanders, from General Ridgway on down, and with each of my senior medical officers. These men, all of whom had extensive combat experience during World War II, as well as during the Korean conflict, indicated to me, without exception, that the medical service being given to their troops was the most outstanding they had every known throughout their military careers. Of more importance to me, and I am sure to you, is the fact that scores upon scores of younger combat officers, as well as hundreds of soldiers, with whom it was my pleasure to talk, told me that the biggest morale factor they carried into combat with them was the fact that they knew that if they were hurt a medical aid man would be immediately on the job to give them first aid, and that steps would be taken almost instantly to remove them to a medical installation where they would receive more complete care. Specifically, I talked with over 150 battle casualties. I asked each one how long it had been, after he was hurt, until he was given medical aid. Almost each of these lads told me that he had received this aid in a matter of minutes after being wounded. There were exceptions to this statement, however, and when a boy told me that he had not received aid for about 30 minutes or so, he always followed this up by explaining hastily that the reason was because his company aide man had been hit before him, or had been killed.

You will be interested, as I was, to know the approximate time it takes for a man to be transferred from an aid station into one of our surgical hospitals, where he is able to get complete medical attention. Generally speaking the wounded men have been transferred from the aid station to a military hospital and have been placed on the operating table within 2 hours from the time of being hit. These steps were achieved by whatever means at hand. In some instances helicopters, in some, jeep ambulances, at other times in ambulances themselves and also frequently in C-47-type transport aircraft. It was truly a phenomenal and wonderful thing to be able to see this quick and efficient evacuation of the wounded taking place. There were certain exceptions, however, which were heartbreaking. In one of these sectors I visited, where the fighting was particularly heavy, and the terrain impassable, it necessitated a 6-hour litter haul to a spot where a helicopter could land in order to pick up the wounded men. From that point on, however, the 2-hour cycle I have just mentioned followed completely.

I am sure that most of you know about the blood program which the American Red Cross carries on, and which gives blood needed by those injured at the front. I had

long been curious to know exactly how far forward this blood was sent in order to be administered to a wounded man. In Korea I found out. Normally the most forward point is the Mobile Army Surgical Hospital—which incidentally is generally the first hospital a soldier enters after evacuation. From this point, however, when a call comes in for a helicopter to be sent to a forward area in order to pick up a wounded soldier, if it is indicated, blood is taken in, and the aid men administer it to the wounded soldier at the aid station where he had been brought for the purposes of evacuation. If his condition is such that time will not permit the total transfusion at the aid station, it is continued while he is en route back to the surgical hospital. I am most satisfied that the blood which we are contributing is reaching our men as soon as is humanly possible.

When our boys are brought into the MASH units—a complete chain of medical care and, if necessary, evacuation goes into effect which sees the lads either returned to duty, or flown to the United States from one of the large general hospitals in Japan. This evacuation chain, and its links of ever-increasingly fine medical installations is the core of the Army Medical Service operating in the Far East. The results are such as to make me completely confident that as far as human energy and resources are concerned, the Army Medical Services is supporting these men who are fighting to the ultimate.

I can illustrate this best, and finally, when I tell you that the only criticism I heard of the medical service, at any time, was the oft repeated phrase, that "the medics are too brave and take too many chances with themselves." If this be criticism, it is a type which I fervently hope will always be pointed at the Army Medical Service.

Mr. McCORMICK. Exercise Southern Pines—where 54,000 United States troops are fighting aggressor forces in the midst of a 2-week mimic war. Most of the defender group in North Carolina—where these, the biggest maneuvers since World War II are taking place—will soon be moved to Europe to join General Eisenhower. Purpose—to help increase the free world's strength there in the fight against Soviet communism. Already arrived, to play their own specialized part in this struggle, is the Army's Second Armored Division. But to truly strengthen democracy Europe against the Red threat, more than guns alone are necessary. Food, vital to the support of any military effort, can often spell the difference between victory and disaster. What is the food outlook for Europe? (whose fields were so recently pocked by the bombs of war?) Just returned from Europe—and ready with his answer—is our own Secretary of Agriculture, Charles Brannan.

Hon. CHARLES F. BRANNAN. Everywhere we went in Europe there were bumper crops about to be harvested. Farmers are getting back on their feet.

Over-all, combining economic progress with the attitude of the many people we visited, I came away from Europe with the feeling that they want to resist communism stoutly and that they are getting in a good position to do so. Everywhere there was great friendliness for the democracies of the West.

I was tremendously pleased with the recovery which has been made possible by Marshall plan aid. I was pleasantly surprised to see how much of the debris of war had been cleared away and how many new buildings were going up. Agriculture there has recovered remarkably and is turning out more than the prewar volume—although, per capita, there is not as much food as prewar because of the steadily increasing population, due in part to the influx of people escaping from behind the iron curtain.

I can assure you that the people that we have sent over there are competent. They

are doing a good job. Our money is being well spent. We are making progress in combating communism through helping to build a strong and stable agriculture in Europe. The basic agricultural problems are: land consolidation, modern farm buildings, more fertilizer, better seeds, more mechanization, and more farm credit.

Mr. BRANNAN. I went right out in the fields and pastures and talked to the farm people. The people were friendly and eager to learn, their homes are clean and well kept, and the whole family works hard.

In the United Kingdom net agricultural production is about 50 percent higher than before the war. England has increased her cultivated crops, such as potatoes, and she is increasing her hog production.

We went from England to France. I believe that France has the greatest possibility for increasing agricultural production of any country in Europe. France is making progress in mechanization and in the use of fertilizers.

In the Netherlands, Holland is tops not only in the amount of fertilizer that farmers use but also in their methods of applying it. In fact, all over Europe I was surprised at the great yields per acre—larger than ours in many cases.

In Belgium, as in Holland, almost every foot of land is put to use.

Most of the European farmers have many small parcels of land in scattered locations. They lose much time going between their numerous fields and most of the plots are too small to accommodate power-driven machinery. With the aid of ECA, many of these countries are helping farmers to consolidate their scattered tracts into more workable units.

Western Germany is making good progress in land consolidation but much remains to be done. Western Germany is making progress in packaging and distributing its dairy products and is working hard to improve the diets of her people. For example, with ECA help, they have just built the first freezer lockers in Europe.

Yugoslavia has great possibilities for increasing her food production. The people of Yugoslavia are very grateful for the food which we sent to overcome the losses occasioned by last year's great drought. That food has not only served a humanitarian purpose but has also assisted Yugoslavia to maintain its independence in the face of constant pressure from behind the iron curtain which bounds Yugoslavia on three sides.

Austria and Holland appear to have specially good extension services. 4-H groups that have been established with the help of Marshall plan aid are carrying on projects about like those of American boys and girls.

The war destroyed much of Europe's livestock industry, the backbone of agriculture there. The animals that were left were mostly scrubby and diseased. Hence Europe has had to place much emphasis on rebuilding herds and obtaining the necessary animal feeds.

With more land consolidation and greater mechanization, particularly small farm tractors, they will be able to increase their agricultural production significantly. But these countries will always be food importers.

I am convinced, after seeing conditions at first hand, that the money we have invested in the Marshall plan countries is doing a job for us. Communism has nothing like it to offer these people. The Marshall plan is bringing economic progress, giving the people faith and hope in the future, providing the foundation for the great preparedness job that is being carried out under the very able leadership of General Eisenhower. In short, I'm optimistic about results, but I know that a lot of work remains to be done.

Mr. McCORMICK. B-29's. These are the bombers that literally made history in World

War II, and are now—as you see them—winging their way through North Korean skies for assaults on the Reds. This formation, escorted by jet fighters, had as its target a Chinese supply depot. Since the sky is overcast, they release their bombs by radar. The B-29—the bomber of yesterday and today.

But now, take a look at tomorrow. This is the Air Force's B-47, a six-jet medium bomber that can be successfully refueled in midair. To keep up front with weapons like these * * * to make Uncle Sam's air punch as powerful as anything the bear can dream up * * * is the job that concerns our next guest. To tell you about it, we focus now upon the Air Force's top development expert, Brig Gen Marshall Roth.

Brig Gen MARSHALL S. ROTH. Tomorrow's victories in the air must be won today in the research and development laboratory.

American industry and science, together with the research and development facilities of the Air Force, are presently engaged in a challenging battle. The ammunition in this battle is scientific and technical know-how. The objective is to develop weapons of air warfare that are superior to those of any potential enemy. However, victory in this battle will not be achieved simply by developing weapons which in themselves are the acme of technical perfection. The degree of technical superiority acceptable in an air weapon must be balanced against three factors:

1. What do we need to do the job?
2. How much time do we have to do the job?

3. What can the Nation afford in terms of money, materials, and manpower?

In order to insure the finest weapons at the least cost to the Nation's economy, the United States Air Force has centralized all of its research and development activities.

At Headquarters, United States Air Force, the Deputy Chief of Staff, Development, is responsible for planning, coordinating, and directing this vast program for the Chief of Staff.

To carry out the development directives issuing from Headquarters Air Force, the Air Research and Development Command has recently been established. From its headquarters in Baltimore, Md., it controls the complex activities of the various development and test centers ranging across the United States.

At Dayton, Ohio, is located the Wright Air Development Center. At this center the responsibility for monitoring the development of weapons systems, that is, aircraft, guided missiles, along with the engine, armament, airborne electronics systems and the myriad other equipment necessary for flight. All-weather flying development and certain phases of light testing also are carried on there. At the Rome Air Development Center, near Rome, N. Y., development of ground electronics equipment, such as that vital in the air defense of the United States, is being pursued.

The Cambridge Research Center at Cambridge, Mass., is engaged in scientific research in electronics and geophysics. This research will lead to the development of advanced equipment and techniques for communication and aircraft control and warning systems.

At Tullahoma, Tenn., the Arnold Engineering Development Center has recently been dedicated. When complete, this center will provide facilities which can conduct supersonic research impossible in present conventional wind tunnels. From this research will come the data necessary for the design of the supersonic aircraft and jet engines of the future.

As aircraft and guided missiles reach the flight test stage, they are tested at one of the three Air Force test facilities. The flight testing of guided missiles is directed

from the Air Force missile test center at Cocoa, Fla. This center has two test ranges: The long-range proving ground located at Cocoa, Fla., and a smaller test site located at Holloman Air Force Base at Alamogordo, N. Mex.

Flight testing of the latest high performance aircraft and test vehicles is conducted at the Air Force flight test center at Edwards Air Force Base, Muroc, Calif.

Typical of the type of flight tests carried on at Muroc is the flight test of the X-5 research vehicle. This aircraft is the latest in a series of special research aircraft whose purpose is to obtain most economically the flight data necessary for the design of advanced types of aircraft of the future. The distinctive feature of this aircraft is that it employs a wing whose angle of sweep-back may be changed while the plane is in flight.

This project and the rest of the USAF research and development program are directed not only toward keeping today's Air Force armed with the best in equipment but also in planning on a long-term basis. All of this must be achieved with a view to providing the maximum security to the American people at the lowest cost.

Mr. McCORMICK. The entire garrison at Bolling Air Force Base, here in Washington, turned out this afternoon to see a 19-year-old Korean war veteran—with one of the most fantastic stories yet to come out of the war—honored with the Purple Heart and the Silver Star. That you may hear, from his own lips, his almost incredible tale—here is Air Force Corporal Richard F. Webb.

Corp. RICHARD F. WEBB. First, I'd like to tell you something a lot of people back in the United States may not know . . . that a lot of Air Force fellows like me are way up front directing the Sabre jets and other airplanes supplying close support to infantry . . . we radio the pilots where the targets are and send them in to get the Communist Chinese and North Koreans.

I had been with a rear echelon organization and volunteered to move up with my aircraft warning and control outfit to strategic position where we could do more damage to the enemy. We arrived at a point just below Taejon.

The first couple of days were quiet. About midnight of a pitchblack night, we began to hear enemy shells. The enemy had completely surrounded our position. We left our open position there and sought cover.

I gave my carbine to a lieutenant and then it dawned on me that neither my mechanic nor I had weapons to defend ourselves with. I went back to our original positions, planning to get weapons for us. Just about that time, about 12 North Koreans surrounded me—all of whom I could almost touch. I was in somewhat of a sitting position and the leader of this group shoved his hand inside my coat. Whether he was trying to find a weapon—or wings, thinking I was an officer—I don't know. Then he asked me in English: "You GI?" I answer "Yes." I'm so used to hearing that question from South Koreans—not thinking anything of it. He proceeded to knock me flat on my back, stomped a foot on my throat and stuck the muzzle of his rifle on my forehead and pulled the trigger. What a noise.

In 1947, I was in an auto accident in which I fractured my skull. And as a result of this, a tantinum plate (a metal plate about the size of a silver dollar) was placed over my injured skull.

Now, it was this plate that saved my life when that North Korean pulled the trigger. The bullet entered the forehead and glanced off that metal plate. Then to be sure I was dead, evidently, I was rolled over and a bayonet jabbed into my shoulder. The bayonet glanced off my shoulder blade.

I lay there, playing dead from that time, about 2 hours in all. Then, when I fig-

ured I was safe I got up and got a canteen and found a jeep that hadn't been wrecked, and started out. It was pitch dark. I missed a turn, and went over a 3-foot embankment. My jeep got halfway up and teetered back and forth. I found an old overcoat in the seat, stuck it under the right rear wheel and climbed up onto the main road. The jeep went out of control and plunged headlong over a 20-foot embankment. The jeep came to a stop on the bottom and again the good Lord was watching over me because I didn't even have a scratch.

In the proceeding drive, I had almost run over a group of South Korean soldiers. I kept down below the underbrush along the side of the road so I couldn't be seen. Pretty soon I heard the patrol coming. All of a sudden I found myself facing 20 or 30 weapons aimed right at me. Someone hollered, "You GI?" I thought to myself, "Oh, brother, the last time I answered 'yes' I got shot." I decided to take a chance and answered, "Yes." Still not trusting them, I asked who their commanding officer was. They didn't understand English. So I said "You know Colonel Kim?" I trusted him and went forward to their patrol. I had to kneel down so they could bandage by head, since they were so short. After dressing my wound, they helped me to walk toward our lines. And we got back okay.

Mr. McCORMICK. So, until we turn our cameras upon the Nation's Capital again next Friday to report on the battle of democracy against world communism, this is Robert McCormick putting a period on your fifty-second battle report, Washington.

Come-Back

EXTENSION OF REMARKS

OF

HON. EDITH NOURSE ROGERS

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mrs. ROGERS of Massachusetts. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following article from the New York Post of September 9, 1951:

BUTCHER WITH PLASTIC HAND TYPIFIES VETS' COME-BACK

(By Representative EDITH NOURSE ROGERS, ranking Republican member of the House Committee on Veterans' Affairs)

A middle-aged man stood up at a recent Washington meeting of persons interested in veterans, and said:

"I run my own butcher shop. A few years ago I lost my right hand in an automobile accident. I thought that meant the end of my business because customers might be squeamish about looking at an artificial hand. But nothing of the sort happened. When this plastic hand was put on, nobody knew the difference."

This happy butcher is one of thousands of nonveterans who are reaping benefits from a program that was aimed primarily at helping veterans. His plastic hand was developed under the auspices of the Committee on Prosthetic Appliances for Veterans.

Three years ago an advisory committee on prosthetic appliances was established, with the duty of overseeing development of artificial arms and legs for the men of World War II. The dynamic chairman of the committee is the regular conductor of this column, Col. Robert S. Allen, who is himself a veteran amputee.

Colonel Allen was General Patton's chief of combat intelligence. Wounded in an ambush, he lost his right arm but was out of the hospital and back on duty in less than 2 weeks. His courage and determination in overcoming this handicap have been an inspiration to every amputee. Thousands of disabled veterans know him from his visits, and so do the Government officials concerned with veterans' care.

Under a law passed by the Eightieth Congress, the Government spends up to \$1,000,000 a year for research in prosthetic appliances. The results have been remarkable. For instance, the weight of artificial arms and legs has been reduced tremendously through use of light metals and elimination of unnecessary parts.

Today many thousands of amputees who a few years ago would have been doomed to wheel chairs are leading vigorous, useful lives. Many others, like the butcher with the plastic hand, who would have been forced to bear a terrible psychological burden, now face the world with optimism and confidence.

Technical Skills for Soil and Water Conservation

EXTENSION OF REMARKS

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave granted to extend my remarks in the RECORD, I include the following article by H. H. Bennett, Chief of the Soil Conservation Service, from the Scientific Monthly of October 1950:

There are three basic steps in getting soil conservation properly applied to the land. First is the making of a scientific land inventory, which we call the land capability survey. This inventory is made by Soil Conservation Service conservation surveyors, in cooperation with farmers, and it covers entire farms.¹ It shows the kind of soil, the slope, degree of erosion, and other factors which, together with climate, govern the whole safe use and producing capacity of land. This information, in the hands of landholder and technician, serves as an accurate land base for the development of scientifically accurate farm plans. It shows—held by field and area by area—the condition of the land and its capability for production, whether for row crops, pasture, timber, or wildlife. Thus capability classes I, II, and III represent cropland, valuable in the order named; class IV is best for grass, but can be cultivated occasionally; classes V, VI, and VII are suited for pasture or timber; and class VIII is best for wildlife and parks.

Next, the technician and the farmer, with a land-capability map of the farm, go out on the land together and develop cooperatively a complete soil-conservation plan for the entire farm. It is of the utmost importance that the technician get out on the land with the farmer, a worth-while farm plan cannot be made in an office or through the use of printed directions. This farm operating

¹ This soil-conservation survey was developed by the Soil Conservation Service. The first survey was made in the Piedmont section by H. H. Bennett and Glen Fuller in 1935. (Georgia Agricultural Experiment Station Bull. 191, May 1935.) The existing surveys pertaining to land cannot be used for soil planning.

blueprint, although aimed first at the maximum protection of the land, takes into full account such economic needs of the farmer as the income he must have to support his family and operate at a profit, his market situation, and so on. The plan specifies the best use to be made of each part of the farm, year by year, the crop rotations; the building of needed farm ponds, terraces, and so on; the development of good pastures; the planting of trees for windbreaks or woodlots; and other things ranging from land clearing to removal of stone fences.

Finally, the soil- and water-conservation measures called for in the plan are applied to the land. As already pointed out, some of the conservation measures are the kind that the farmer can put into practice himself, with little further technical assistance, but generally the complete plan of coordinated conservation practices is of necessity so complex as to require expert technical help in putting it to work on the land at the proper place and in proper adjustment. The farmer provides all the materials and labor and maintains his structures and practices once they have been installed on the land. If technical help is needed on the maintenance job, that, too, is provided for in the arrangement between the soil conservation district and the Soil Conservation Service.

Each conservation measure is specifically designed to fit the land on which it is used. Furthermore, each measure is designed to support or complement another one, or several other measures, wherever support is needed, whether in the same field or in an adjoining field, above or below. Also, conservation work on one farm is planned and carried out with an eye to the needs of the next farm and to farms downstream. This viewpoint is essential, for the process of erosion has no respect for boundary lines. Gullies don't stop at fence lines, farm lines, or even county or State lines. Neither do dust storms nor floods. And the costly process of sedimentation never concerns itself with the interests of water users dependent on unprotected reservoirs.

WATER CONSERVATION

At this point, I want to say something about water conservation, a matter that has been of acute interest and concern to many of us during the past year. Drought, of course, had much to do with the much-publicized eastern water shortage, but there are other matters, I think, that should be looked into, such as planning ahead for watershed protection for all new installations, and for remedying conditions, where necessary, on the watersheds of existing reservoirs.

In the Soil Conservation Service, when asked for suggestions, we always look first at the land within those watersheds where water shortages have occurred. We examine the condition of the land and how it is being used, from the standpoint not only of soil wastage but of water wastage, too. We look at all the land to see if any of it is being seriously affected by erosion, such as is most commonly caused in humid areas by (1) cultivating excessively steep land without adequate protection, (2) overgrazing, and (3) burning. All these abusive practices contribute to wastage of both water and soil. It is the excessively rapid runoff of water that produces erosion. And, what is of great importance in reservoir maintenance, is the prevention of filling up with the solid products of soil erosion. Washed-in soil takes up the valuable reservoir space needed for water. We cannot drink soil.

Much of the water that is prevented from immediate runoff soaks into the ground, partly to seep out below into our streams and reservoirs, partly to be available for plant growth, and so on. Water conservation, in

short, is part and parcel of soil conservation everywhere.

More and more farmers are coming to realize that they need special technical help in planning and applying adequate soil and water conservation programs for their farms. This growing national consciousness of the essential place that such conservation has in our whole economy—a consciousness shared also by many and varied urban groups and interests—is evident in the great progress we have made as a Nation in soil and water conservation within a comparatively few years.

THE SOIL CONSERVATION DISTRICTS

These districts are organized by the farmers themselves under State legislation enacted by all 48 States, the Territories of Alaska and Hawaii, and our insular possessions of Puerto Rico and the Virgin Islands. As of June 1, 1950, 2,247 of these farmer-managed districts already had been formed, embracing more than three-fourths of the Nation's farms and a total of more than 1,237,000,000 acres. Nine States are entirely covered by soil conservation districts: Alabama, Delaware, Massachusetts, Nebraska, New Hampshire, New Jersey, Rhode Island, South Carolina, and Vermont.

The soil conservation districts represent, I am convinced, the greatest land movement in all history. They are democratic units of State government. They are essentially group action devices through which strong local leadership develops. They draw together, as at the hub of a wheel, the services and facilities of cooperating governmental and private interests alike, local, State, and national. And the soil conservation districts also are responsible for such tangible results as the creation of new markets for manufacturers of equipment and tools, and for the sale of the products of nurseries and seed producers.

A soil conservation district organization, of course, is not an end in itself. A district program that exists only on paper is not worth the paper it is written on. Neither is a farm plan for soil conservation where its provisions are not applied to the land. Up to January 1, 1950, approximately 800,000 complete soil-conservation plans had been prepared in districts alone. These plans covered some 220,000,000 acres, of which more than 112,000,000 had been treated with needed conservation measures by that time. These figures do not include other millions of acres surveyed, planned, and treated through other programs in which the Soil Conservation Service has assisted.

Up to the first of this year, also, detailed soil conservation surveys adequate for farm planning had been made on 322,000,000 acres. The primary objective of our broad program of conservation is, of course, to bring conservation treatment at the earliest practicable date to every parcel of land still needing it. And a primary requisite to achievement of such a goal is completion of the national land capability inventory at the earliest date facilities will permit. This scientific, acre-by-acre inventory of the land is the foundation on which rest effective conservation planning, treatment, and use of land for the permanency of the land, as well as the optimum development and maintenance of its water, timber, wildlife, and other land-related natural resources.

INCREASING PRESSURE ON THE LAND

The economy and efficiency of soil conservation farming, and the chain of economic and other benefits it brings, have been proved wherever it has been practiced. Thus, it enables the farmer to produce needed crops or livestock at minimum cost on his good land, and to adjust his production to changing market and other conditions. He therefore becomes a better and more stable customer for business and the professions in the city and contributes to the Nation's high stand-

ard of living—nutritionally and otherwise—and to such public benefits as reducing flood and situation damage.

Anything that helps any substantial number of individuals of a country also helps the country as a whole. This certainly can be said of the kind of soil conservation farming we have been discussing. We must keep our armed services and national defense machinery strongly built up, certainly; but we dare not neglect our domestic economy either. We do, after all, have to pay for ships and atomic bombs; and we can do this only by having an efficient economy, in agriculture as well as in industry and trade. And there can be, of course, no efficient agriculture without a base of good land.

Constantly increasing population and a still shrinking supply of productive land will eventually make greater efficiency in food production more and more imperative. In addition, we may be moving along lines of development which will call for increased production of organic materials, such as organic plastics. That would mean additional pressure on the same land that has to produce our food and other essentials. These needs already are exerting their influence on the world's limited supply of productive land and probably will continue to do so with such force as to challenge our utmost technological capacity. Every passing year demonstrates the growing importance of this relationship.

It is true that we have made remarkable progress in the field of soil and water conservation, but we need to move ahead still faster in order to get the big remaining job done in time. Lasting soil conservation is vitally important everywhere. It is mandatory here in America if we are to avoid eventual national decline in our economy. The margin between land deterioration and conservation has been narrowed within recent years. By increasing our present conservation operations on the land, we can—and should—get the principal basic measures of soil conservation applied to the land within 20 to 25 or 30 years.

We now know pretty well what the problem is, where it is, and how to solve it. We have perfected the tools of conservation—the methods and techniques and the knowledge for applying them with scientific reliability—and we have the farmers' soil conservation districts through which to work. We are moving ahead at a progressively faster rate year by year. In 1942, to illustrate, we completed the soil conservation job on 5,000,000 acres; in 1949, the same thing was done on 22,000,000 acres.

All we need now are additional facilities and the decision to go ahead fast enough to do the job on a scientific, permanent basis before it is too late—before we have wasted too much land. Unfortunately, we still are wasting land, even though we have learned that it is easier and more economical to conserve soil and water than it is to use those costly methods that impoverish land and waste rainfall as so much runoff to the sea. The more quickly the job is done, the easier it will be and the less it will cost.

MORE UNDERSTANDING COOPERATION NEEDED

We are faced with the important educational-technological task of spreading the understanding of this vital matter more widely and rapidly. It is a challenge to all of us, and each one has a part to play. From every conceivable angle—economic, social, cultural, public health, national defense—conservation of natural resources is an objective on which all much agree. The public and our society as a whole have a vital stake and, therefore, an enduring responsibility in these resources. It will take the best efforts of us all, working together on the conservation job, to get it done before it is too late.

**Dr. Bosworth's Address to the Montana
Tuberculosis Association**

**EXTENSION OF REMARKS
OF**

HON. MIKE MANSFIELD

OF MONTANA

IN THE HOUSE OF REPRESENTATIVES
Monday, September 24, 1951

Mr. MANSFIELD. Mr. Speaker, it was my good fortune to be able to attend the annual meeting of the Montana Tuberculosis Association held in Helena, Mont., on September 8, 1951, and to meet with my friends, both white and Indian, who have done so much to combat tuberculosis in my State of Montana.

I was tremendously impressed, Mr. Speaker, with the main address delivered by the renowned Dr. Howard W. Bosworth, M. D., medical director, the Barber Sanitarium, Los Angeles, Calif. Dr. Bosworth, one of the country's leading authorities in the field of tuberculosis, honored us by coming to Montana and we deeply appreciate his giving us the benefit of his wide knowledge. To many of us, his talk was the highlight of the convention.

Mr. Speaker, under unanimous consent, I am inserting Dr. Bosworth's address at this point in my remarks:

Due to the speed with which we live, our sense of values sometimes becomes quite distorted. Ever since Biblical days, the words "leprosy" or "leper" have struck fear into the hearts of most people. Leprosy has always been dreaded; shunned by all, and universally believed to represent a living death. Years ago laws were passed requiring isolation of this disease, and institutions for isolation were provided for those who contracted it. In San Francisco not long ago one person with leprosy arrived from abroad and the event made newspaper headlines throughout the country. Yet leprosy is a disease suffered by relatively few people and one which has a very low degree of communicability.

The dangers of leprosy are far less than the dangers of tuberculosis, and yet today, we who are in this crusade, have to fight the apathy of the world in order to secure the measures necessary for the control of a disease that kills many times more people and causes an economic loss so great that it cannot be estimated. A disease which kills nearly 50,000 people a year in this country and causes untold suffering, is still a disease which too few people take seriously. Tuberculosis can be eradicated within a generation. We have the tools with which to do it. It is only apathy that will prevent this from happening.

In his presidential address to the National Tuberculosis Association, a short time ago, Dr. William Shepard estimated that this country spends \$174,000,000 a year for the care and control of tuberculosis, and that we now lose over \$200,000,000 a year in the net future earnings of the heads of families who die of tuberculosis. Think what a saving it will be when we do eradicate tuberculosis. On all sides we hear the same story. We could eliminate this disease, but we need beds, we need money, we need more workers, and we need to preach the gospel of tuberculosis until it reaches everyone in this land. The same kind of apathy that allowed the World War, the same apathy that allowed a Pearl Harbor, is the same kind of apathy that you must fight today, year after year, if we are going to bring people to the realiza-

tion that we can and we must control this disease. Not many years ago, if a bed were available, a case of tuberculosis could be treated and rehabilitated for \$1,000 to \$1,500. Now the cost is double that. The longer we wait, the greater the cost, and the greater the loss. Today, fearing another war, we are spending billions of dollars for defense. Time magazine for August 20 of this year stated that in Julius Caesar's day, the average cost for killing a man in war was 75 cents. In World War I, it was \$21,000; in World War II, it was \$75,000, and the cost is still going up. It is hoped that by spending these billions for defense, that we can prevent another war and save the lives that would be lost by such a conflict, and so, paradoxically, we spend nearly \$100,000 to kill an enemy—one man—but we object to paying \$3,000 or \$4,000 to save the life of one tuberculosis patient. Is it truly the apathy of the public, or is it our own fault that we have not succeeded in our own program of education?

I have talked to many men in public life, city councilmen, county supervisors, State legislators, national Congressmen, and a few Governors. While every one of them have been interested in keeping the tax rates down and living within their budget, not one of them but who has been willing at any time to spend as much money as necessary for the control of tuberculosis, providing the people they represent want it and ask for it. After all, these public servants are our own representatives, and for the most part they do as we ask, but unless we educate the population whom they serve, and make known the real facts, we cannot justify taking short cut to demand that they appropriate money when it is contrary to the wishes of the people themselves. That is a challenge to every tuberculosis association in this country. You can call it propaganda or education, but it simply means to take to our people the hard, honest facts concerning the economics of tuberculosis control.

OUR PAST METHODS

We might at this time review our past methods in order to evaluate the work that has been done up to date before we set out on "the road ahead."

The tuberculosis control program has not been a one-group program. In the United States alone the crusade against this devastating disease has been the greatest national cooperative health movement that has ever existed. It has been so well organized that the work of our groups, agencies, and individuals, have been coordinated into one great plan of action, with each supplementing and complementing the work of others. It would be well if everyone of us who works in a local or State association could take a brief look at the over-all national picture so that we could better understand our own place in this vast plan.

Tuberculosis is an international problem and not confined to the boundaries of a certain country or small area. Each one of us is just a small part in the whole picture of this great movement. The World Health Organization is at the top of the list but because of lack of funds and certain political interference, has had troubles of its own. In spite of this it is doing a splendid piece of work. Then we have the various national and continental organizations exchanging information and aid because science knows no national boundaries.

In most countries where the organization is strictly scientific, however, such as South America, the crusade is not well balanced or financed, and as a result the movement lags far behind the work being done in the United States. Those who believe that tuberculosis should be completely under medical control would do well to examine the records of those countries where it is done this way. After all, it is a combination of medicine, of public

health, and of community interest and cooperation with the representatives from these groups that makes for a well-balanced program.

In this country we have the official agencies which would include the United States Public Health Service, the State health departments, your own local health departments, and your own institutions, also the school systems throughout the land. Then there are the military groups, the Army, the Navy, and the Veterans Administration. Of the voluntary agencies we have, the tuberculosis association at the State and national levels, and as an integral part of these we have the medical section of the national, and medical sections of many State associations operating under the name of the Trudeau Society. We have the National Conference of Tuberculosis Secretaries whose members lives are also dedicated to the control of the disease.

The medical societies throughout the United States have their stakes in this movement, and the hospital associations are now awakening to their responsibilities. The American Public Health Association has always been interested in this type of program. The medical schools in colleges and the research centers throughout the United States are now taking more and more interest in control measures, and recently the drug manufacturers have taken an active part in tuberculosis research. In one generation we have come a long way in our organization of the control pattern. From now on, under this control pattern, if we have the cooperation of the public, we should more rapidly achieve the objectives for which we are working.

Within this framework of organizations, it has been demonstrated that the problems which face us can be solved. There is one danger however. When so many different groups are all working toward the same objective, methods are bound to differ. If we lose sight of our objectives and waste time in quibbling over the various methods to be used, we will always weaken our campaign and retard our progress. I say this with considerable feeling because my trips throughout the different parts of the country have made me realize that in some areas petty jealousies and disagreements between the different cooperating agencies have interfered in the forward progress of the campaign.

Specifically, there are places where the voluntary agencies do not work well with health departments. There are other associations where the health educators or the secretaries or the lay groups find there exists considerable friction between them and their medical societies. Then there are certain individuals in medicine who not understanding our programs are extremely critical of public health attitude in our voluntary organizations feeling that it is another wedge to so-called socialized medicine. Most of these individuals in their hearts are just as interested as we are in eliminating tuberculosis, but for the most part they do not have the broad viewpoint necessary to understand the entire pattern of the campaign. After all, tuberculosis control is preventive medicine, and everyone who is working in this movement in any organization believes in preventive medicine. In order to have harmony, when once we have agreed upon our objectives, it is necessary to work out the best methods and those which are satisfactory to all, which is by no means impossible when there is a sympathetic understanding between those who are interested. Every community has a slightly different problem to its neighbor, and slightly different techniques can be worked out to meet these individual problems, and our central organizations are constantly on the watch for the good points of these programs in order to give

every other section of the country the advantage of the thinking that has gone into these results.

ACCOMPLISHMENTS OF PAST 50 YEARS

Perhaps we should stop for a moment to think what we have accomplished during the last 50 years, starting when tuberculosis was a leading cause of death in this country. A continued campaign of education has been most effective in disputing the ignorance concerning the disease thereby bringing about earlier diagnosis and less exposure of contacts with the resulting lower incidence.

What about the medical side of treatment. In the earlier days patients were sent to sanatoria that were little more than pest houses. Today they are sent to hospitals. We have learned that many cases need more than just bed rest and will respond to different forms of collapse therapy and to surgery. And surgery has improved so tremendously in the last few years that we are no longer hesitant to remove a lobe or an entire lung if it is so indicated. With the recent advent of our antibiotics, we find we have a great help in chemotherapy, although as yet streptomycin, PAS, Tibione and some of the other drugs do not cure tuberculosis, but they do have an inhibiting effect upon the bacilli to give us an opportunity to utilize other measures in treatment which we would not have dared to have done a few years before.

The tremendous strides in surgery and in the treatment of the disease have now made possible the saving of thousands of lives of advanced cases that a few years ago would have been condemned to death. All this improvement in treatment is due to clinical, surgical and bacteriological research, and we may well be proud of the fact that we are leading the world today in these methods.

All of these accomplishments taken together have caused us to drop the death rate in tuberculosis during this 50-year period from 200 per 100,000 to under 26 per 100,000. This curve in death rate plotted for the entire time is almost a straight line, giving us the information that is necessary to predict future diminishing death rates during the coming generation.

Such predictions, however, are not so easy as one would think. The accomplishments of treatment and of tuberculosis control, it is true, are lowering the death rate, but we must not be misled or lulled into complacency, and we must remember that we are prolonging the lives of many thousands of active tuberculosis cases through our present methods of treatment.

Our case finding procedures are finding tuberculosis earlier and treating it successfully, and while the death rate is dropping, the incidence of tuberculosis is actually an unknown figure and may not be dropping at anywhere near the rate that we have previously supposed.

We are not yet ready to say that tuberculosis is no longer a health problem. When a polio case is reported, it causes great concern in any community as it should, yet while there were 42,000 cases (not deaths remember) of polio reported in 1949, there were 50,000 deaths from tuberculosis, and for every death there are many individuals exposed to the disease, and a fair percentage of those exposed will contract it. The estimates of the number of beds needed for tuberculosis for every annual death have varied all the way from 2½ to 10 beds providing we plan to isolate in homes or institutions every new case and every active case that exists. Such a program would, of course, speed up the elimination of the disease in much faster time. Tuberculosis can be controlled as a public health problem. It is not like polio whose mode of spread is still unknown. The cause and the mode of spread of tuberculosis is known and we can control it.

THE PRESENT PATTERN

Knowing the cause of tuberculosis, there are seven basic points to keep in mind for the control of the disease. They are the weapons that to date have brought us to the point where we can now see daylight ahead. The first is health education of the general public. The second is better medical education of the physician and the nursing profession. The third is case finding. The fourth is isolation, treatment, and education of the patient. The fifth, rehabilitation. The sixth, research, both social and scientific, and the last, the cooperation of all agencies. No one group has been responsible for this entire program. It is the coordinated effort of all the groups that are interested in our part of the health program that has achieved the results up to the present time.

There is a very close liaison between the National Tuberculosis Association, the United States Public Health Service and the Veterans' Administration, and there are joint committees working on mutual problems of these organizations at all times. The National Tuberculosis Association, the National Conference of Tuberculosis Secretaries, and the American Trudeau Society through joint thinking instigate much of the national planning and serve as pilots for the State associations. The State associations in turn transmit much of this information to the locals and particularly in strong associations such as we have in California, try to give service to the smaller associations who have much more limited resources than those in the larger cities.

As a part of the National Tuberculosis Association, the medical section, the American Trudeau Society, is responsible for a program of professional education which includes the publication of the American Review of Tuberculosis. Medical research and therapy is one of its greatest interests, and at the present time around \$170,000 is being spent annually on research, and it is hoped that if the additional percentage that the board of directors voted at a recent annual meeting is turned over to research, that over \$200,000 per year will go into the various studies pointed toward the complete elimination of tuberculosis through proper treatment. We realize that \$200,000 is a small amount, but when one is aware of the fact that the small research program we had, served to stimulate some of the national pharmaceutical houses to carry on their investigative work which eventually brought out the streptomycin program which cost millions of dollars, we realize that a little pump priming can do. It is only a little over 3 years ago that these same pharmaceutical houses made available to the American Trudeau Society over \$1,000,000 worth of streptomycin to do the original clinical evaluation of this antibiotic. Government agencies cooperated, and from this study has come one of the great cooperative efforts in the study of antibiotics and chemotherapy products on both a research and a clinical basis.

The Veterans' Administration, under the leadership of Dr. John Barniwell, has done one of the greatest pieces of coordinated research that has ever been done. Every 6 months, for the past 3 years, the directors and usually the head of the research department of every veterans' hospital that is treating tuberculosis, are called together to give a complete report of the cases that they have treated with these various drugs. Protocols for selection of cases and for treatment have been set up. Jury panels have evaluated hundreds and hundreds of cases. Some of these panels have been run by the Veterans' Administration and some by the United States Public Health Service. They have all cooperated in this big coordinated program, and we have within 3 years time done studies that heretofore would have taken from 10 to

15 years to have accomplished. The whole picture of treatment has changed, and different types of the disease which heretofore were considered fatal, are now successfully treated.

As a result of this we now have two definite points of attack, and there is a race between the Public Health control measures on one side, which have done much to reduce our mortality rates, and on the other side the scientific treatment of the disease, which brings the elimination of tuberculosis almost within our grasp. We have another possibility which may become a part of our future program, and that is the vaccination against tuberculosis with BCG. This vaccination is not as specific as vaccinating for smallpox. Neither is it a substitute for control measures or techniques, and there is still considerable controversy in regard to the value of vaccination in certain areas of the country, as it affects some of the control measures and indications that go with it. It is wrong to believe, as some would have us believe, that we can eliminate beds for tuberculosis by vaccinating the entire population. We have not yet reached that stage. The time may or may not come when we can prevent the spread of the disease by using this form of preventive medicine. In the meantime beds will still be needed for those who should be under treatment and should be isolated. I could go on at length telling you about the various research projects that are now under way, but the time is getting short, and I want to go on to some of your specific problems in your community.

MONTANA'S PROBLEMS

You have here a large State, much of which is a rural population. I need not tell you that you have one of the greatest Indian problems in the country, and you have many producing mines which in spite of all the precautions that can be taken cause silicosis and a predisposition to tuberculosis among many of the workers. Your cities are scattered and your problems are different in different areas. In looking over your annual report, I find that the greatest amount of tuberculosis is in those areas where there are Indian reservations and in those areas where there are mines, and it would seem that these are the centers from which the disease is spreading. I assume that these are the points that you are attacking as your first objectives. Your death rates in the rural areas are much lower than the national average. This should not deceive you, however, as such conditions have deceived most of us. In an article called *The Rural Challenge* in the October 7, 1949, *Public Health Reports* by Dr. Milton I. Roemer, he points out that we can attack, and eventually control, most of the tuberculosis in the urban areas but there will still be a large reservoir of tuberculosis in our rural areas and that because of the expense of case-finding hospitalization, and rural health programs, this will be a permanent reservoir of tuberculosis unless we give more and more attention to assistance to our rural populations. Today, the large communities are getting the most attention. The time will come when we will realize that the rural communities are just as important in our health programs.

What, then, are some of the responsibilities of your State association? It is true that the various State associations should benefit from the information and leadership of the national organizations. It is the responsibility of the State to seek out the needs of the local areas in order to find the weak places where more help is needed. Field service should be provided to all the locals, particularly the smaller ones.

It is the responsibility of the State organization to thoroughly organize the State into either country or district tuberculosis associations. We must always keep in mind the fact that the great strength of the tubercu-

losis movement lies within the local associations in the home communities. Unorganized territory is still a problem in many of our States. In California we have no unorganized territory. We do have certain very sparsely settled mountain counties where the seal sales are only a few hundred dollars and where the State has to give additional service, but the fact that there is an association in those areas has stimulated interest, has assisted in providing part-time health departments, and has done much toward stimulating community health organization in those small, isolated areas. A State association is not a local association and it should not have to handle the details of a local association. These details should be handled at a local level under the guidance and help of the State. The more organized territory there is in any State, the stronger the State association will be. In those areas where there is very little tuberculosis, the tuberculosis association should spearhead the movement toward a health council and should support the development of a part-time, and later, a full-time health department. Strong health departments always result in healthier communities.

The State associations should give assistance to the State health departments and other agencies. This does not mean that the health departments should slough more work onto the voluntary associations, as the trend should be in the other direction, that is, for the voluntary association to assist with those things for which tax money is not available until such a time as the official agencies can take over when the demonstration has been completed. From both the State and local associations, contributions can be made to research, and in some States our research program is sponsored within the State itself. In order to preserve a better understanding and balance between public health projects and strictly medical problems, and a greater interest in the whole tuberculosis program, the State Trudeau Society should be very closely integrated with the State Tuberculosis Association. Following somewhat along the lines of the national organization, the State Trudeau Society, subsidized in part by the tuberculosis association, can stimulate medical education and research, and can be of tremendous help in advising a State board on programs along medical lines. As more and more State Trudeau societies are being developed, they are following along this pattern with excellent results.

It is the responsibility of the State association to evaluate the work of the local associations and to advise accordingly. When new locals are started, it is often necessary to subsidize them until they are self-supporting. If a local association is falling down in its program, there are times when it is necessary, if the local does not change its plan of operation, for the State to refuse a seal-sale contract and reorganize a new local in that particular community.

There is always a certain amount of suspicion of the State association by some locals, but the State association is there to help and to assist, and when there is a mutual understanding between the two organizations, particularly if the directorship in the State organization is actively interested and well distributed throughout the State area, this suspicion usually disappears. The National Tuberculosis Association puts out literature which it would be well for all of us to know. The Tuberculosis Association, Its Organization and Administration, is one. Building a Community Program for Tuberculosis Control, is another, and the recent Evaluation Guide for Tuberculosis Associations, if honestly used is a good mirror to show us our failings as well as our achievements.

We have spent much time on the past and its achievements, the organization and the tools with which we work. Now, what about the future? What should our program be, and what may we expect to accomplish?

THE ROAD AHEAD

Using the standard tools and methods that have proved so successful, just how can you apply them in your State? The first is health education. I cannot stress this point enough because almost every failure of a tuberculosis association to reach its objective is due to the fact that the public has not been thoroughly educated. Health education for the general public should be well integrated, starting in the public schools and carried on through the public press and through all civic organizations. Much literature and many moving-picture films and slides are available to help, but the message should be taken to the people through direct contact such as speakers' organizations in local communities. In order to do this job right a tremendous program of organization is necessary, but it can be done, and it is the cornerstone of all of the rest of the program.

The second point is better medical education of the physician and the nursing profession. Postgraduate courses, medical symposia should be planned in connection with county medical societies and local tuberculosis associations. The programs should not be limited to tuberculosis because, frankly, they have little appeal, but by combining tuberculosis with some of the other problems in medicine a good attendance is usually secured. Emphasis should be placed upon the reporting of cases and the early diagnosis, and the follow-up of the case-finding programs. Public-health nursing is extremely important, and the public-health nurses should be well-grounded in tuberculosis, as they contact this more than any other of the communicable diseases in their work. And what is more important, there should be enough of these nurses available in every community to carry the load.

Case finding has been given a great emphasis through miniature X-ray films, but that is only a part of the picture. Rapid tempo X-rays are splendid, but every doctor's office should be a case-finding center, every hospital should X-ray all admissions, and here again, case finding can be successful only if there is a good organization behind the X-ray surveys, and a good program of health education which precedes them, and an efficient follow-up system on all cases found. Simply sending an X-ray truck or machine into a community and setting it up does not take very many X-rays, but a community organization developing this program in advance, furnishing hostesses and bringing people into the machine, is much more effective. In Los Angeles we recently tried an experiment and at one of our trucks a tuberculosis association employee asked everyone what brought them in to have their X-ray made, and it was interesting to find out that 22 percent saw it in the street, around 49 percent read it in the newspapers, between 11 and 12 percent were told by a friend, 5 percent were recommended by a doctor, about 6 percent saw it in posters, 5 percent were contacts, none were referred in by their churches, one saw it in television, and one just didn't know. Such a check at a machine will give you an idea of the efficiency of your organization campaign, and it may surprise you with the result, but no case-finding program is worth much unless there is a follow-up on cases.

Therefore, the fourth step is isolation, treatment and education of the patient. This means that there should be sufficient beds available. The minimum requirement of 2½ beds per death is barely enough in any community to meet the real needs. Without our Indian population, your State would

probably be able to meet this requirement, but with the problems involved as a result of the reservations, you do need help, and need it badly. The National Tuberculosis Association has recently taken a greater interest in this problem and I hope will be of some assistance in the future. In the meantime the problem is in your laps to meet as best you can.

The fifth step is rehabilitation. While Federal rehabilitation funds are now available in every State, it is hoped that this program can be speeded up to the point that the rehabilitation starts a short time after the patient has entered the institution and carries through until he can be restored to an economic status that will insure his continued health. Rehabilitation has been a stepchild of the tuberculosis movement for many years because of the difficulty of showing tangible results. It is common-sense reasoning, however, from the economic viewpoint, to stress suitable rehabilitation for patients in need of this type of service to prevent future reactivation of the disease and to improve the economic status.

The sixth point is contributing to medical research. The future of medical research lies in three fields. The first is along the routine lines of better methods for studying the tubercle bacillus and its effect, and for the development of better laboratory procedures along these lines. When one realizes the short period of time that has elapsed since Koch discovered the tubercle bacillus and the refinement of laboratory methods now in use for discovering the presence of this bacillus and for taking it apart and studying its component parts with equipment such as the electron microscope, along with its performance under different conditions, we realize we have come a long way, but there is much more ahead of us, and more and more fields are being opened constantly for investigation if we had the workers and the money available to support their projects. The second field lies in immunization against the disease. At the present time, considerable work is being done with BCG vaccination. Programs are under way to vaccinate millions of people in the European study. In this country a large number of studies are in progress, and several foundations are being developed for the study of BCG and the production of the vaccine which, as yet, is being produced commercially by only one licensed laboratory.

Experimental work has not yet progressed to the point that we can be sure that BCG is a definite protection, although we believe it has some protective powers, but there are many, many investigators who believe that vaccination will only be a small part of our program of prevention and actually will not be anywhere as effective as proper control methods have been in the past and should be in the future.

The third and perhaps the greatest branch of research, at least the one which is most spectacular, is a search for a specific drug, chemical, or antibiotic which will kill tubercle bacilli. To date there are many which will kill them in the test tube but which for various reasons either cannot be used or are ineffective in the human being. Definite progress has been reported, as we know, with antibiotics, promine, paraminosalicylic acid, and now much work is being done in synthesizing chemicals by changing the composition of the molecule in order to see what effect it will have on the tubercle bacillus and how it will be tolerated by the human body. The appeal of this research is great, but again there is tremendous shortage of qualified research workers who are interested in tuberculosis, and much money is needed for fellowships in order to train proper men to carry on this work. Clinical research is, of course, progressing at a rapid pace. It took the atom bomb to

awaken the people to the potentialities of mass research in one project, and this project is one which is capable of destroying all life on this planet. If we could only awaken our people now to the potentialities of mass research for prolonging life and eliminating disease it is within our power to do this, and I wonder whether we are going to meet that challenge.

Finally the last step is cooperation of all agencies. The tuberculosis association can spearhead the drive, but the voluntary associations should work with the public agencies and with all community organizations for the improvement of health in the community. Development of community health councils and full-time health departments will pay big dividends and should head your list.

Such a program as I have outlined is a long term program; one that may take years to accomplish. A program based on this outline cannot help but reduce the tuberculosis incidence in any community, and with patience and hard work it can be done. You people in Montana have come a long way. You have limited funds, large areas, few health departments and few tuberculosis associations, and you have great responsibilities. I am sure that you know better than I the weaknesses and the strength in your present program. You like all of us are staggering under a terrific load of taxation and unless tuberculosis has struck in your own family or close to you, it is difficult sometimes to become really fired up in this campaign, and unless you get close to it and see at close hand what it does, it is just another appeal among hundreds for help. Everyone here, I am sure, feels that he is doing his part to eradicate this disease, but are you giving everything you have to this movement? A tuberculosis association is not a social organization. It is a working group with the determination that nothing can stop its progress toward preventing any more broken lives, broken families and the tragedies that go with tuberculosis. If Montana can wipe out tuberculosis, so can the United States, and the reason we can do it is because each of you who are at the center of planning, thinking and working in your community, will have done your part to accomplish this job.

Recently I saw a new patient just admitted to our hospital. She was a mother with three children. Her husband is a patient in the tuberculosis unit of the Veterans Administration hospital and he is not going to live. This girl is desperately ill, and she, too, may not live. The children are scattered among relatives. This was a happy family only a few years ago, facing life with all the optimism of the world, and now what does life hold for any of them? Even the children have been infected.

Not long ago I sat at the bedside of a young doctor who was dying from tuberculosis. He had cured once before, but not long enough, and the demands made upon him from his country practice when he went back too soon, caused him to break again—and in spite of all we could do, he died. He left a widow and a son, and a community that needed and worshiped him.

I have been at the bedside of many who were dying from tuberculosis, and as each one passed away, leaving brokenhearted friends and relatives, I have grown more bitter. Not one of these deaths was necessary. Every one could have been prevented. They didn't have to catch tuberculosis, but they were exposed to it by someone else who had it. Only the apathy of people slows up the progress in eliminating this disease. No one is safe until every case is found and placed under treatment.

Fifty thousand deaths a year, fifty thousand heartbroken families, all from a disease which can be controlled if we will do it. If anyone can visit a tuberculosis ward in a large general hospital and see in long rows,

beds of patients, many of them suffering a living death, and then cannot dedicate his or her life to fighting this disease, they are callous indeed. Tuberculosis is no respecter of persons. Any one of these patients except for the grace of God might be you.

Ladies and gentlemen, the fight against tuberculosis is a religion. I wonder, if you have not already done so, will you combine your own religion, whatever it may be, with the religion of tuberculosis control, rededicate your lives, join this crusade, redouble your efforts, and help us fight this disease until it is no more?

The Soil: Our Heritage

EXTENSION OF REMARKS

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the Record, I include the following address by H. H. Bennett, Chief, United States Soil Conservation Service, Farm and Home Week Agronomy Day, Kansas State College, Manhattan, Kans., February 3, 1950:

THE SOIL—OUR HERITAGE

It is most appropriate, it seems to me, that you have made soil conservation a definite part of your Farm and Home Week program. There is much we need to be thinking about, talk about—and do something about—in this basic field of agricultural betterment through soil and water conservation.

There is good opportunity at this time for all of us to serve in the cause of soil and water conservation, and with this opportunity go certain obligations and definite responsibilities. As the concept of soil conservation has grown and fixed itself in our American agricultural pattern, these responsibilities have grown in proportion. I am talking about the broader responsibilities, notably the responsibility of positive and vigorous leadership in bringing conservation treatment at the earliest practicable date to every acre of land still in need of it—in Kansas, the United States, the world. It is the kind of cooperative leadership that is so well demonstrated here at Kansas State College, where all of us whose agricultural work brings us into the State have the fortunate opportunity of working with your leaders like Dean R. I. Throckmorton and President "Milt" Eisenhower and others.

BIG CONSERVATION JOB TAKES TEAMWORK

This conservation task we have set ourselves to is no simple one, as I am sure you well know. There still are many obstacles to be overcome before the goal can be attained completely. The job is big and urgent. It takes, first of all, some degree of conservation mindedness on the part of the farmers on the land. And it takes continued teamwork on the part of those agencies and groups which have something to contribute. I have reference, for example, to soil-conservation districts; State, local, and Federal agencies, local groups and public-spirited individuals; and business interests ranging from bankers to seed dealers. Safeguarding our productive land is in the interest of everybody; we all depend on it, city people as well as the farmers.

HOW WE HAVE BEEN SPENDING OUR HERITAGE

When our forefathers came to America, they found a land that was unbelievably rich in soil, forest, mineral, and other natural resources. The American colonies soon be-

came a source of revenue for the mother country. Most of the wealth was produced directly by seemingly limitless acres of new, fertile land reaching westward from the Atlantic Ocean. Surely, our forefathers thought, that beautiful storehouse of wealth, wide open to unrestrained exploitation, never could be exhausted; and, indeed, quite beyond the wildest dreams of those early Americans, the richest and greatest Nation of all time has grown out of that land in only a few generations.

For 150 years we pursued an agricultural policy that contained too much of the habit of plow up, wear out, and move on to a new piece of land. There was too little thought of the day of reckoning that would surely come as the penalty for such spendthrift ways in the management of our irreplaceable land resource. As a result, we allowed nearly a third of our original supply of topsoil to wash or blow away—washed down the rivers to the oceans or widely and wastefully scattered by the wind. Floods like those which have harried parts of the Mississippi Valley already this year, and droughts like that of the 1930's so sharply remembered out here, helped to speed up this soil waste. Because of our thriftless ways in the use of our God-given heritage of productive land, such as probably no nation before us ever felt heir to, we permitted half or more of the cropland of the United States to be damaged, chiefly by erosion—many millions of acres so severely as not to be capable of further economic cultivation in the immediate future.

THE SOIL—CONSERVATION ERA

Fortunately, we now have entered a new agricultural era in the United States. This is the soil-conservation era, which, for the first time, finds conservation of land, water, forest, grass, cultivated crops, and wildlife intimately tied together and coordinated on the basis of land capability and need. This is a basic tenet of modern soil conservation. Any sound conservation program, intended to be permanent, must always be guided scientifically by the kind and needs of the land. Such a program requires the support of continuing research in order to give the land all the advantages of progress in science.

We now can say, I believe—and events like this one here this week bear me out—that national policy and public thinking, with few exceptions, are agreed on the utter necessity of conserving these interlocking natural resources. Research, education, surveys, scientific farm planning, and the successful application of conservation measures have brought us to a new concept of the importance of land and, also, of the need for keeping the land permanently productive while in use. We are determined now to husband carefully what remains of our soil heritage.

TREAT THE LAND ACCORDING TO CAPABILITY AND NEED

Nature's laws were so contrived that land, water, plants, and animals all should exist in harmony and interdependence for perpetual productiveness of these essential resources which distinguish the earth from a barren planet. So, to safeguard the land, it must be treated and used according to capability and need. This accords with nature's law, which man too often has overlooked or has been unable to see because of lack of understanding. This concept, I firmly believe, is of the order of importance with the discovery of the utility of the wheel and of fire.

There was a time, as already indicated, when productive land was so plentiful, in this country and elsewhere over the earth, that people saw no need for concern over the possibility of its decline. But that time is past. Nations, and even civilizations, have declined or perished, because of land impoverishment through misuse, neglect, and erosion. Now, we must assume serious responsibility for the care and sound use of the land that we have left. Land exploit-

tion, land and water wastage, must stop. Failure to stop these losses eventually would lead us into the most serious trouble, because of the utter indispensability of productive land.

Good soil cannot be stockpiled like tin or manganese; it can't be mined from the depths of the earth or dredged from the floor of the oceans. And it can't be grown. Hydroponics on any large scale seems utterly impracticable. As for "food from the sea"—it is important, of course, but it remains to be proved that all the oceans can be made to produce, in any practical way, anything even approximating our annual United States crops of a billion bushels of wheat and 3,000,000 bushels of corn, together with great quantities of tobacco, potatoes, rice, timber, and the others. And I should like, also, to emphasize as strongly as I can, regardless of anybody's claims to the contrary, that we still haven't learned how to build new topsoil, or even a reasonable substitute for it, on any substantial scale, within any brief time.

CONSERVATION IS OUR COMMON CONCERN

The conclusion, then, is as logical as it is inescapable. That conservation of the soil and of the water which makes the land produce is a basic consideration to those phases of agriculture having to do with crop improvement, livestock development, and home betterment. Every bushel of wheat or corn comes from the soil and from nowhere else. Every pound of beef and pork and mutton comes from productive land and from nowhere else. Good Kansas farm homes are just as attractive and comfortable as the acres around them are capable of yielding the necessities to provide for the luxuries which go to make up a prosperous and satisfying farm enterprise. So, conservation is our common concern—be we soil conservationists, agronomists, educators, bankers, machinery dealers, or housewives who shop to supply the family table. Every man, woman, and child in Kansas and throughout the country depends on productive land for virtually all their food, as well as a large part of their clothing, and for all of their wood, leather, and many other necessities.

So it is important that all of us—especially those of us who are engaged in agricultural work in any way—keep always in mind various basic facts which bear on our common problem and so largely determine our success in solving it. And we need to be alert to certain misconceptions that still seem to prevail in the thinking of some, and be prepared to help dispel them. Some of these misconceptions, briefly stated, are:

SOME MISCONCEPTIONS TO DISPEL

1. That soil conservation is of secondary importance, has already been taken care of, or can be postponed.
2. That there are short-cuts to conservation, or that farmers can or should do all the necessary conservation work without technical assistance.
3. That soil conservation costs more than it is worth, and that dollars-and-cents considerations are all that are at stake.
4. That we have all the good land we need, and that soil erosion is an inevitable part of nature's scheme.

One thing which is important to the progress of the whole conservation action program is a general understanding of the technical practices and measures which farmers are using in their soil conservation districts, and the necessity for the kind of on-the-farm technical assistance which they obtain through their districts from the Soil Conservation Service, along with the research findings from the State agricultural experiment stations, with most of which the Soil Conservation Service is now cooperating. Accordingly, I think it is entirely appropriate that we consider again what we mean when we talk about modern soil conservation.

WHAT MODERN SOIL CONSERVATION IS

Modern soil conservation is based on sound land use and treatment of land with all the proven appropriate measures that are needed to keep it permanently productive while in use. It means terracing land that needs terracing; it means contouring, strip-cropping, and stubble-mulching the land as needed, along with supporting practices of crop rotations, cover and green manure crops, etc., wherever needed. It means gully control, stabilizing water outlets, building farm ponds, locating farm roads and fences on the contour, planting steep, erodible land to grass or trees, development of good pastures and ranges, and devoting good management to them after they have been developed.

Modern soil conservation, moreover, consists of doing these and still other necessary things. Where land is too wet, modern soil conservation calls for drainage; if it is too dry, it calls for irrigation; if it is subject to wind erosion, it calls for wind-stripping, tree planting, and stubble-mulch farming. If plant nutrients, lime, and the humus supply of the soil have been depleted, it calls for fertilization and addition of lime and organic matter, if water soluble salts have accumulated in toxic quantities, it calls for drainage and leaching out of the salts by flooding. And modern soil conservation calls also for the use of the best of the most adaptable varieties of crops as well as the most efficient tools available to farmers.

And, of course, an indispensable part of modern soil conservation is a supporting program of research, such as will provide for the welfare of the land at all times the advantages that progressive science can contribute. Also, a continuing, vigorous program of soil conservation education must be made a part of our teaching from kindergarten through college. Moreover, modern soil conservation calls for the maintenance of all effective work which is put on the land. In short, there is only one correct formula for doing the soil and water conservation job. That formula consists of treating the different kinds of land on a farm or ranch according to their individual need or condition, and using each kind according to its capability for continued safe and economical production.

AGRONOMIC TECHNIQUES INDISPENSABLE TO SOIL CONSERVATION

It is quite apparent, I think, that the most advanced agronomic information as well as sound engineering and hydrologic techniques are basic to carrying on this modern soil conservation. Such basic principles must be used in the management of the land, whether that land is growing row crops, small grains, or grass. As all of you so well know, many crop failures by individual farmers can be traced directly to their failure to observe proved agronomic, engineering, and hydrologic principles in seedbed preparation, methods of planting, quality of adaptable seed, weed control, water control, or some other fundamental within their control that has to do with sound soil and water conservation. In most cases this information, as well as information on forestry and other specialties, has been developed through research and practical experience. But we still are not getting it applied fast enough on enough farms.

We know, too, that organic matter is important to maintain or improve soil structure; yet we have seen wheat grown continuously on some lands that should have the benefit of a grass-legume rotation. We have gone through two world wars, each emphasizing the need for wheat; and Kansas has led all the States in meeting this need. At the same time, much Kansas soil shows the bad effects of continuous cropping to wheat without rotation. And there is also great need for stubble-mulch tillage to make use of soil-protecting crop residues; level terraces to hold water and get better plant

growth; and, in the eastern areas particularly, measures like strip cropping, terraces, grassed waterways, and so on both to control erosion and conserve water.

Then there are various related problems, such as the need of efficient drills that will seed mixtures of range grasses for regrassing the many thousands of acres that need to be in grass. And we need, in many areas, more seed-cleaning equipment for grass. Better distribution and storage facilities are essential so that in years like 1948, when a large quantity of native grass seed was harvested, this seed can be stored safely until it is used. Price fluctuations in grass seed like brome can be hard on a producer if such facilities are not available.

GRATIFYING ADVANCEMENTS IN KANSAS

I am not unfamiliar with some of the many things you have been doing out here in Kansas in the field of agronomy that are contributing so importantly to the progress of conservation farming. I am thinking, for example, of the improved grass strains developed at the Soil Conservation Service Nursery here in cooperation with the State experiment station and the Kansas Crop Improvement Association. The success story of your Auchenbach brome, for instance, is too widely known for me to need to discuss further its merits and how it is contributing so substantially to your grass-improvement program. The good work in maintenance of soil fertility and use of grass and legumes in crop rotations and the use of fertilizer, especially nitrogen on bromegrass to produce more seed, might be mentioned also. Your pure-seed development and seed-increase work likewise has been most important in these respects.

And I am sure that just about everybody in Kansas—along with a great many people elsewhere over the country—knows about the interesting and significant wind tunnel experiments here at the experiment station, in which we are cooperating under the 1946 Research and Marketing Act. From what I have learned of this basic research on wind erosion control, begun late in 1947, I feel confident that most helpful information is going to come of it in finding the most effective tillage, planting, and other methods adapted to representative soils subject to blowing. In this connection, if you haven't seen it, I recommend for your reading a little eight-page leaflet by the Soil Conservation Service, called *Dust Storms Come From the Poorer Lands*.

"The most important thing we found out in this study about land failure," the leaflet points out, "was that most of the land that failed was poor land at the time it was first placed in cultivation. Likewise, it was learned that most of the abandoned land which was later reclaimed was a better class of land to start with. In other words, most of the dust storms of the thirties came from the poorer land. While some of the better land was abandoned during the 1930's and did blow to some extent, it was usually not severely and permanently damaged and was later reclaimed and placed back in cultivation."

NEED TO COMPLETE NATIONAL LAND INVENTORY

There you have in a nutshell what we are getting at when we so strongly urge going ahead with our land capability surveys as fast as we can. The primary objective of our broad program of conservation action is, of course, to bring conservation treatment at the earliest practicable date to every acre of land still needing it. But a primary requisite to achievement of such a goal is completion of the national land capability inventory at the earliest date facilities will permit—by 1956 if possible. This scientific, acre-by-acre inventory of the land is the foundation on which rests effective conservation planning, treatment, and use of the land for the permanency of the land.

The Soil: Our Heritage**EXTENSION OF REMARKS**

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave granted to extend my remarks in the RECORD, I include the following address by H. H. Bennett, Chief, United States Soil Conservation Service, Farm and Home Agronomy Day, Kansas State College, Manhattan, Kans., February 3, 1950:

THE SOIL: OUR HERITAGE

(By H. H. Bennett)

We don't have to wait for another drought to put this basic information to work. For example, using land in accordance with its capability can best be accomplished when we shall have ascertained these capabilities through a Nation-wide survey of the land of the Nation. This information would enable us to retire from cultivation to grass or trees those lands not suitable for tilled crops.

Actually, we may, in this way, be coming to the best opportunity we will ever have in our lifetime to get land out of cultivation that shouldn't be in cultivation. Such a prospect would point to an even greater responsibility for conservation—a greater need in this part of the country, for instance, for more grassland-livestock agriculture, because you can't safely summer-fallow some of the steeper land.

In such event, we would need more forage crops, readjustments in our rotations, and more livestock to put our agriculture on a sounder basis. Conservation farming, on the basis of following the complete conservation farm plans used by farmers and ranchers in their soil-conservation districts, almost invariably calls for diversification of crops, often including more land in grass and trees. In this way—and this is most important—the economic stability of the farm operation is improved, and the farmer is in a better position to operate successfully in a period of hazardous markets. I was interested in an introductory statement appearing in a new Department of Agriculture bulleting which came over my desk a couple of weeks ago.¹ It said, in part.

"Wherever it is feasible to substitute forage crops on acres now producing corn, cotton, or wheat and to utilize them profitably through livestock, opportunities exist for combating the threat of surplus production of these crops. Adjustments of this type also work toward improving the national diet, conserving soil resources, and lending greater stability to farm incomes."

SOME BENEFITS OF CONSERVATION FARMING

Our observation of conservation farmers' experience over the years confirms this economy of soil conservation, and its numerous other advantages. We know, to illustrate, that the same amount of seed, fertilizer, machinery, and management will produce a better return from the most productive land (capability classes I and II) than from less productive land (such as capability classes III and IV). Soil conservation treatment similarly saves seed and fertilizer in treatment of wet lands, irrigated lands, and range land, and does away with the costly need for replanting. Our investigations have shown, moreover, that conservation farming utilizes

the soil as a storage reservoir for water, thereby providing the moisture or at least part of the moisture needed by growing crops during dry seasons; and this is reflected in enriched soil and improved crops. In cases of prolonged drought, this water conserved often will mean the difference between successful production and crop failure.

Our studies of farmers' actual operations have shown, also, right here in Kansas, that less tractor fuel is required to operate farm equipment on the contour than uphill and downhill; and contour farming causes less strain and wear on equipment than plowing up and down the slope. In irrigated areas, soil conservation methods mean reduced erosion and better and less expensive use of available water. In wet fields, conservation methods remove excess water by drainage, help to maintain a desirable soil structure, minimize unfavorable soil baking, and permit favorable soil aeration. All of these things tend to emphasize the fact that soil conservation as we practice it here in this country is important during a period of declining markets and hazardous prices as well as during one of expanding markets and rising prices.

It is fortunate that we have advanced so far in developing sound soil and water conservation methods and techniques and in setting up the facilities through which to put them into effect. We have been moving forward in this vital task of soil and water conservation at a quickening pace, although there is, as we all realize, the need for speeding up the application of conservation on the land, and the demand from farmers and their districts for technical assistance has continued to outrun the increase in our facilities for providing such help, here in Kansas and all over the country.

SOIL-CONSERVATION DISTRICTS

Virtually all of the Soil Conservation Service's technical and certain other assistance, including that in flood control, is made available to farmers through their soil-conservation districts, as you know, and today I think this is the best way to get the job done effectively. These districts represent, I am convinced, the greatest land movement of all history. Today—after only 12½ years since the first district was formed in August 1937—soil-conservation districts have been organized through the democratic processes provided by State enabling acts in all 48 States, as well as in our Territories of Alaska and Hawaii and insular possessions of Puerto Rico and the Virgin Islands. These districts already include more than three-fourths of the Nation's farms, including a total of 1,200,000,000 acres.

And Kansas farmers and ranchers well may be proud of their standing in the national district column, with approximately 97 percent of the State's land now within the boundaries of its 101 soil-conservation districts. That is how close you are to joining the nine States and two insular possessions which are 100 percent covered by districts.

I want to repeat what I have said over and over—that soil-conservation-district organization, of course, is not an end within itself. A district program that exists only on paper isn't worth the paper it is written on; neither is a farm plan for soil conservation, where its provisions are not applied to the land. I feel sure that most of you are acquainted with the conservation work which has been accomplished in your Kansas districts, without my taking time to review those accomplishments. But I do want to call attention to the large amount of sound, permanently effective conservation work which already has been done in the country as a whole.

SOME SOIL-CONSERVATION ACCOMPLISHMENTS

Preliminary estimates available when I left Washington showed that up to January 1, 1950, approximately 800,000 complete soil-

conservation plans had been prepared in soil-conservation districts alone. These plans were developed by farmers and technicians of the Soil Conservation Service working together out on the land. By that date, these plans covered an estimated 220,000,000 acres, and 114,000,000 acres had been treated with needed conservation measures by that time. These figures do not include other millions of acres surveyed, planned, and treated through other programs in which the Soil Conservation Service has assisted. Up to the start of the current fiscal year (July 1, 1949) detailed soil-conservation surveys adequate for farm planning had been made on 304,000,000 acres, and reconnaissance surveys helpful in farm planning had been made of another 177,000,000 acres.

GRASSES AND LEGUMES STRESSED IN CONSERVATION PROGRAM

During the past fiscal year (1949), our Service was called on to assist 154 more soil-conservation districts than during the preceding fiscal year. The conservation planning and application of practices in districts increased over that of the year before, again reflecting the continued progress of the district conservation program throughout the country. For the past several years, one of the most important agronomic activities of the Service was the harvesting, planting, and use of grasses and legumes in cooperation with the districts.

In 1948, the Service directed the harvest of approximately 3,000,000 pounds of native grass seed (mostly little and big bluestem and Indian grass), mainly in Oklahoma. These seed were largely used in flood-control and soil-conservation activities carried on cooperatively by the Service working through the independent soil-conservation districts. That was an exceptionally good year for seed production of those native grasses in that region.

In 1949, the Service was responsible for harvesting 1,851,000 pounds of native grass seed. Most or all of these grasses were domesticated by the Soil Conservation Service. Many thousands of different kinds of grasses and legumes—species, varieties, and strains, were brought from their native state into our soil conservation nurseries, where their growth habits were carefully observed for possible conservation use at some place in our American agriculture. At present, 31 of the 40 native grasses and legumes thus domesticated have a promising place. Many of them can now be bought on the market. Some 15 years ago, not one of them could be bought anywhere. Nine are in process of domestication.

In addition to this harvest of native grass seed for furthering the national soil conservation program, 198,000,000 pounds of other grasses and legume seed were harvested last year through the direct and indirect efforts of the Soil Conservation Service in working with soil conservation districts. These figures relate to seed most of which were used in soil conservation districts on farms which have been planned by the Soil Conservation Service at the request of district farmers. Altogether, enough seed were harvested in the above manner to plant 9,272,000 acres, over and above the millions of acres already seeded as the result of previous harvests.

Since these grasses and legumes are very largely essential for carrying out the best possible job of soil conservation, an adequate seed supply is a matter of major concern, now that the use of grass, legumes, and grass-legume mixtures is spreading over the country so rapidly. It is not meant by this that the seed supply is adequate, but the supply would be considerably further from adequacy but for this continuing seed-increase effort of the Service. When the Service finishes its job of helping get these important grasses and legumes introduced into trade channels, it steps out of the seed

¹ Will More Forage Pay? Bureau of Agricultural Economics, U. S. Department of Agriculture, Miscellaneous Publication No. 702, p. 1.

business so that commercial seedsmen can take over.

The domesticated natives included such grasses as blue grama, sideoats grama, slender grama, big bluestem, little bluestem, western wheatgrass, switchgrass, big bluegrass, Indian rice grass, sand dropseed, and salt sacaton. Some of the more important previously domesticated and introduced grasses and legumes, which have recently been spread so widely and into so many new areas are: *Sericea lespedeza*, crested wheatgrass, smooth brome, Suiter's grass (tall fescue), wild winter pea, vetch, blue lupine, and Hubam clover.

OTHER AGRONOMIC CONSERVATION MEASURES

The increased production of grass and legume seed is being reflected in improved cropping systems. That, of course, is the measure of its worth. The need for improved rotations also has received major emphasis, with particular stress on those for ground cover at the critical time of the year to prevent erosion, improve soil structure, increase the soil supply of organic matter and nitrogen, furnish grazing for livestock, and green manure for a variety of crops. The practice of strip cropping on sandy soils subject to wind erosion is being stressed as an important part of our program, and stubble-mulch farming in adaptable areas continues to be of major importance, in many districts being accepted as an indispensable practice of soil conservation. Our observation has been, too, that the availability of improved equipment, as shown by the sale of larger numbers of subsurface tillage implements, and the interest shown by farm-equipment people is having a favorable influence in the spread of stubble-mulch tillage for erosion control.

At the same time, pasture and range development and improvement continues as a fundamental part of our soil- and water-conservation work. Not only is the relationship between soil conservation and raising livestock a natural one, but this modern, progressive kind of farming likewise promotes the development of high-quality herds. Good cattle, sheep, or hogs and good productive land go together just as naturally as scrub stock goes with poor land. The conservation farmer or rancher knows from experience that profits are increased when his abundance of economically produced feed and forage are sent to market on the backs of quality animals.

In a study the Soil Conservation Service made some time ago to find out what conservation farming does to a farmer's production, we got back some interesting and significant information as to the trend toward more grass crops and livestock. Here in Kansas, for instance, the 203 reporting farmers supplied these first-hand figures: An average increase of 15½ percent in their hay and pasture acreage after developing their conservation plans; a 28-percent increase in the number of dairy cows, an even greater increase in number of beef cattle, and also a big increase in poultry. I have been pleased to note that numerous Kansas soil-conservation districts have established seed plots in order to increase seed supplies of needed grasses and legumes. Also, that State Conservationist Fred Sykes reported last summer, after a trip to several of your branch experiment stations with Dean Throckmorton, that plans were developed to make adaptation and observational grass planting at these stations.

HOW CONSERVATION FARMING PAYS

Other studies, with uncounted individual reports from farmers and ranchers, confirm the fact that this kind of soil- and water-conservation farming pays good dividends—to the land owner or operator, to business and his community in general, and to government. The Soil Conservation Service, to

illustrate, took a sample inventory to show 1945 income from conservation-treated farms as compared to that from similar farms on which much less conservation work had been done. Reports were included from 1,872 representative farmers and ranchers, including a number of Kansas farmers. The over-all per acre increased income from soil conservation was \$4.90.

It is estimated, moreover, that in 1948 (the only year for which we have the figures) the Federal Government got back the entire amount spent by the Soil Conservation Service and made a 77-percent profit besides in increased income taxes paid on increased returns as a result of farmers' applying effective soil-conservation measures to their lands. This estimate was based on reports from district farmers all over the country. The gain included increased revenue received by retailers, processors, and distributors who profited directly from handling the farm products involved.

A great many public benefits are coming from conservation farming, as, for example, lessened flood damages and reduced siltation of reservoirs, streams, and harbors. Thus in our normal conservation work, as previously stated, the objective is to keep our agricultural land permanently productive while in use.

In our flood control operations, more emphasis is put on the task of slowing down runoff. For both purposes, we terrace sloping land, plow it on the contour, strip crop it, control gullies, take steep, highly erodible land out of cultivation and put it under the protection of grass or trees, and so on. Protection of farm water outlets with grass, protection of grain land with stubble-mulch farming, and building up the fertility of the soil likewise aid both flood control and soil conservation operations. In watershed flood control work, of course, we go considerably further with special measures.

WE MUST KEEP AT THE JOB

So it is that we are going about the vital task of safeguarding our remaining soil heritage. We have been moving forward in this task at a quickening pace, and there is no good reason at all why we cannot continue to do so, depending on the availability of technical and other manpower, machinery, and materials—and also good and persistent co-operation from every person and organization capable of doing anything worth while in aid of the program. I can't say this too often.

But we must keep steadily at the job of taking the best possible care of the land. There is no time or place for lagging or postponing. It is my hope and expectation now, after a lifetime of effort in this direction, that our leaders will see to it that the program of soil conservation which is moving ahead with a remarkable degree of effectiveness, as a sound investment, and with greater speed than the public seems to be aware of, is safeguarded and continued. The attention given to this important matter by leading agricultural groups like your own gives me great encouragement in this hope.

Progress in Soil Conservation

EXTENSION OF REMARKS

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. WICKERSHAM. Mr. Speaker, under the leave to extend my remarks in the Record, I include the following address by H. H. Bennett, Chief, United States Soil Conservation Service, distin-

guished lecture series, University of Arkansas, Fayetteville, Ark., March 7, 1950:

PROGRESS IN SOIL CONSERVATION

(By H. H. Bennett)

THE PROBLEM

A prosperous and lasting agriculture depends on an adequate supply of productive land properly used and so protected from erosion that it will remain permanently productive. Without such a lasting agriculture, there can be no assurance of permanent prosperity, happiness, or peace anywhere on our earth.

As long as people have enough productive land they can continue producing their food and fiber, and many of the raw materials of industry. If, on the other hand, the land is neglected or unwisely used, it will be wasted or severely damaged by erosion, and the certain consequences will be poverty, hunger, and national decline. That has been the tragic result in many of the world's older agricultural areas.

For these and other reasons lasting soil conservation is mandatory everywhere. It is mandatory here in America, if our Nation—our civilization—is to avoid tragic decline, economically, socially, nutritionally.

LAND SUPPLY

We now have left in the United States approximately 480,000,000 acres of good land, counting all that is in cultivation and all that can be brought into cultivation by irrigation, drainage, and other feasible means.

In recent years we have been using for crop production and rotational pasture around three hundred fifty to four hundred million acres annually. Something over 70,000,000 acres of this farmed area is unfavorable for use as cropland and should be diverted to grass or trees.

And all but about 100,000,000 acres of the 480,000,000 acres of good land is susceptible to severe damage by erosion, waterlogging, and floods. Such hazards can be overcome only through modern soil conservation and flood-control operations. This means that the soil conservation work must be scientifically fitted to the land according to kind and need and the flood control done all the way from the crests of enclosing divides on down to the main channels of the watershed drainage systems.

SOLUTION OF THE LAND PROBLEM

Solution of the land problem calls for the use of every acre of every farm and ranch throughout the Nation according to the kind of land and the needs of the land. This is a physical requirement that cannot be avoided. And there is no need to avoid it, since there are always safe uses to which land can be put in order to keep production within the limits of market requirements.

This may sound simple, but carrying it out is not everywhere a simple matter by any means. It means, among many other things, that some of the acres devoted to cultivated crops should be permanently turned to grass or trees and that other acres will sometimes need to be planted, at least temporarily, to a protective cover of grass. It means also that all land, whether used for crops, grazing, timber, or wildlife, must be adequately and permanently protected.

Unfortunately many millions of acres are not being used wisely in this country—and in most other countries. They are not being used according to natural capability and are not being protected with essential conservation measures. As a consequence many millions of acres here and elsewhere are eroding or are being damaged by waterlogging, accumulation of alkali, and in other ways. In some parts of the world land is still being permitted to decline in productivity or to be ruined for further cultivation faster than it is being safeguarded with conservation

measures. This is true in most countries; it is tragically true in a great many countries. Unfortunately it is true also here in the United States, although in our soil conservation work we are ahead of other countries having physical characteristics similar to ours.

The margin between land deterioration and land conservation has been narrowed within recent years here in the United States. We are making real progress with our national program of soil conservation, although we are not yet going fast enough. Still we have reached the point where our goal of a permanent agriculture is almost in sight. By increasing our present conservation operations on the land, we can—and should—control erosion and related processes of land impairment within 20 to 30 years, that is, if we all work together helpfully and with confidence in one another, and are provided with the facilities. We now know pretty well what the problem is, where it is, and how to solve it. We have made a splendid start toward solving it. All we need now is the decision to go ahead fast enough to do the job on a scientifically applied, permanent basis before it is too late—before we have wasted too much land. Really we should not waste so much as one single acre more. However, we still are wasting land, even though we have learned that it is easier and cheaper to conserve soil and water than it is to use those wasteful methods that impoverish land and waste rainfall as so much runoff to the sea.

The tragic fact must not be overlooked that still we are losing around 500,000 acres of land each year as the result of needless erosion and waterlogging, with a still larger area damaged in lesser degree.

MODERN SOIL CONSERVATION

Modern soil conservation is not directed merely toward maintenance of the status quo. It is dynamic and progressive. It leads to increased and lasting productivity of the land and thereby promotes the common welfare wherever it is practiced. All regions of the world probably can be improved and some currently poverty-stricken areas may be advanced to a state of relative prosperity by safeguarding and increasing the productivity of agricultural land through soil and water conservation.

Modern soil conservation does much more than safeguard land. It directly or indirectly results in a wide variety of fundamental benefits. It both increases the yields per acre and lowers the cost of production on most farms, and this, in turn, starts a whole chain of benefits, such as increased farmer income; increased taxes for support of local, State, and Federal Governments; increased trade for both rural and urban communities; and increased employment for professional, skilled, and unskilled workers.

It results in large savings, such as reduced siltation of streams, ditches, harbors, and costly reservoirs; lessened damage to fills, cuts, and culverts of highways and railroads; diminished damage to oyster beds and breeding and freedding grounds of fish, crabs, and other valuable aquatic life, and reduced flood crests on both major and minor streams, thereby lessening destruction of or damage to farm and city property, livestock, highways, railroads, manufacturing plants, and other property.

It helps to alleviate drought damage to crops, pastures, and meadows. It encourages a more flexible and diversified type of agriculture with a sound physical basis for making annual adjustments in the amounts and kinds of production needed to stabilize the national and world economies. It helps create a greater pride and satisfaction in farming, along with the greater material returns. It encourages the sons and daughters of farmers to stay on the farm, and become partners with their parents in the farming business. And last, but not least, it appar-

ently helps to improve the health of all the people.

Some indication of what soil conservation means to those who practice it in this country is indicated in a recent letter from a Texas farmer who said, in part:

ABILENE, TEX., December 19, 1947.

DEAR DR. BENNETT: As there is a lot of talk . . . about the benefits of soil conservation . . . I would like to say a few words in behalf of soil conservation.

. . . I was born and raised on a farm in the Ozark hills in northeast Arkansas. . . . I moved with my parents to Red River County, Tex. . . . in the fall of 1919 and farmed with them until I married in the fall of the next year and rented a farm close by . . .

We . . . started out with very little money, but lots of determination. Bought our housekeeping outfit and farming tools . . . on credit and my father let me have a pair of mules to work . . . That fall I went to the bank and borrowed money to buy the mules.

I was renting the farm . . . and continued to rent . . . for 8 years.

We then decided to try our luck further west, so I rented a farm near Stith . . . Jones County, Tex. . . . Made three crops on this farm, then moved across the road on another farm and made four crops, then moved to a farm 1 mile west of Abilene in Taylor County and lived there 3 years, at which time we were approved by the Farm Security Administration to buy a farm.

We . . . located a farm of 160 acres . . . that we could buy for the amount of money that was allowed by the FSA . . . the total of our loan was \$7,678.

So in the spring of 1939 we began farming as landowners. And now comes the part of my story that I am most interested in. My family at this time consisted of one daughter and two sons, the daughter being 17 and the boys 11 and 9 years. The daughter is married . . . and the boys are both in college . . .

. . . I am a natural-born farmer, as you can see, although I have worked a little at other jobs at different times, such as mining, cotton ginning, barbering, teaching school, and so forth.

The first thing I did after we moved on our farm was to begin a soil conservation program.

I had always advocated soil conservation and practiced it as much as my landlords would let me, so when I moved to my own place I began to put into practice what I had been talking. I went to the SCS office and got the boys to run me a set of terrace lines and had the terraces built by the county machinery, paying for them myself.

The SCS boys worked out a complete plan for my farm, located tank (pond) site, helped plant clovers, vetch, peas, and so forth.

This was one of the first farms to be put under a soil conservation plan in the Button Willow watershed and there are now 37 of the 41 farms in the watershed that are carrying out soil-conservation programs.

. . . Until recently I have been a supervisor of the Middle Clear Fork Soil Conservation District. . . .

When we bought this place we had 40 years in which to repay the FSA loan, but we paid it out the seventh year, and this was made possible through the soil-conservation plan that has been carried out on the place.

As proof of the above statement, this year I made 18 bushels of wheat to the acre without the aid of fertilizer and one of my neighbors just across the fence made 9 bushels and another on the other side used fertilizer and made 11 bushels.

Now you may be wondering just how much time and expense the Government has been out on my farm. Well . . . the SCS boys have spent around 8 days' work on my

place, first and last. Now at \$10 per day that would be \$80 expense to the Government.

Back to the statement about my wheat, the county average this year was 8 bushels, but I think the county average over a 10-year period is 12 bushels. So you see my place is making one-third more than the average.

Did I hear you say have I paid the Government anything in return for the \$80? Well, to be exact, I just paid a little over \$600 income tax year before last, over \$500 last year. . . .

Since paying for my place I bought 200 acres more land adjoining it last fall, and have just completed 6 miles of terraces this fall on it. My plan calls for reseeding part of it back to native grasses with a complete pasture program, such as mesquite and prickly pear eradication and water control.

I am a believer in diversified farming and have always kept a small dairy herd, a few brood sows, and raised plenty of feed for them.

So my advice, as a farmer to a farmer, is get your soil- and water-conservation program started now and watch your income increase.

Yours truly,

W. O. DAWSON

COMPLEXITY OF THE SOIL-CONSERVATION JOB

If there is any activity of mankind that requires the most scrupulous use of all that land science and hydraulics can provide, it is the work of keeping our land permanently productive and making the best use of our water supply.

There are in the neighborhood of a hundred soil and water conservation measures now being used in the program of the Soil Conservation Service to halt erosion, conserve rainfall, and improve the land. These measures include terracing, contouring, strip cropping, cover cropping, crop rotation, stubble mulching, range and pasture improvement, wood-land improvement, gully planting, establishing grassed waterways, constructing farm ponds, adjusting land use, using organic and mineral fertilizers and lime according to need, drainage, irrigation, and so on. Each measure is used, as the situation demands, to meet a definite land need or to produce a specifically desired result. Usually, combinations of several measures are essential, used wherever necessary in mutual support of one another to obtain the most effective conservation.

A hundred years of farming experience in this country has definitely proved that no single practice, applied arbitrarily on a whole field or farm, will control erosion and maintain soil productivity permanently, except perhaps the planting of an entire area to grass or trees.

Single-practice soil-conservation programs have never been successful on cultivated land in terms of real and lasting conservation. They can't be successful in the great majority of cases because a single conservation practice is almost always inadequate to cope with the diverse and complicated requirements for sound land use and protection, imposed by nature. Some single practices, such as contouring, rotation, stubble mulching, or manuring may bring some temporary benefits to entire fields or farms, but they can't get the job done on anything approximating a permanent basis, except on the relatively small areas of the very best quality land (land of capability class I).

It is not the passing benefits of a single season or a few years that means success in the battle any country must wage to keep its good land productive and to make the best use of its less productive land—of all its agricultural land. It is the long range—the lasting—benefits that will be reaped by all the people of a country, their children, and their children's children, that really count. A permanently productive agriculture is the

goal; not just temporary gains in crop production or income.

The record of experience proves that most farmers are no more prepared to solve their difficult problems of erosion and water control alone than they are prepared to solve all their legal and medical problems. There probably is no more reason to assume that all farmers can witness a demonstration of complex soil and water conservation work and thereby equip themselves to do similar effective work than there is to assume that they can equip themselves to practice successful surgery by witnessing a surgical operation.

TECHNICAL ASSISTANCE NECESSARY

Practically all farmers need specialized, experienced scientific assistance on the ground to solve their land and water problems. Without such assistance, they cannot successfully bring their agriculture to full fruition.

Effective and lasting soil conservation work demands the utmost in technical excellence. A trained, experienced soil conservationist prescribes for the land just as an experienced physician prescribes for his patients. In a sense, Soil Conservation Service technicians are land doctors. These men have learned that halfway measures and improperly selected practices will not get the job done and that such measures often do more harm than good over a period of years.

Each conservation measure is specifically designed to fit the land on which it is used. Furthermore, each measure is designed to support another one, or several measures, wherever support is needed, whether in the same field or an adjoining field, above or below; also, conservation work on one farm is planned and carried out with an eye to the needs of the next farm and to farms downstream. This viewpoint is essential, for the process of erosion has no respect for boundary lines. Gullies don't stop at fence lines, farm lines, or even county or State lines; neither do dust storms, nor floods. And the costly process of sedimentation never concerns itself with the interests of water users dependent on an unprotected reservoir.

To hope that anything less than a scientifically planned and properly executed conservation program for each field, each farm, and each watershed will give the needed permanent protection to the land is to hope for the impossible; and, what is more important, any acceptance of the idea that there can be a shorter and easier way of doing the job is dangerous. Not only will it delay getting this most necessary agricultural work done, but it may confuse those who have already attended to the needs of their land.

For example, it is frequently necessary to build graded terraces on sloping cultivated fields in humid areas, in order to carry excess rainfall safely off the land. The terraces must always be built with sufficient channel capacity and with the proper gradient (slope toward the side of a field) to handle the estimated volume of runoff at a rate of flow that will not produce scouring of the channelway. Moreover, the terraces must be spaced at proper intervals and at the best locations in a field to take care of all the runoff water. They require protected outlets; otherwise erosion is likely to begin at the outlets and cut gullies up the terrace channels far back into the fields. And even after the water has been moved safely off a field by means of such a terrace, or diversion system, a stabilized place must be provided for its final, safe disposal. This, again, calls for a complete survey and adequate technical engineering and agronomic planning to properly locate and construct the terrace outlet waterway.

Improperly built and inadequately maintained terraces, as well as terraces that are built on slopes that are too steep, usually do more damage to the land than no terraces

at all. If a terrace ridge is too narrow or too low, or if the channel is inadequate to take care of the runoff from intensive rains, costly and ruinous erosion will surely follow. The terraces will break or overtop and damage the land below as well as the land on which the terraces are constructed. The rate of land damage, also, is usually increased rather than reduced when drainage systems, strip cropping, and various other practices are improperly applied.

For a farmer to be able properly to solve all these problems having to do with but a few of a hundred major soil conservation practices, it will be necessary for him to have a high degree of proficiency in engineering, hydraulics, agronomy, and land science. Few farmers have such training. Most farmers are not engineers, or hydrologists, or agronomists, or soil scientists, or foresters. They are farmers; and being a farmer is a full-time job in itself. So when it comes to dealing with a difficult erosion problem—and most erosion problems are difficult—most farmers need the help of guidance of a trained soil conservationist in order to arrive at the correct solution and get the best returns from their conservation efforts.

Whether the actual conservation operations are carried out by farmers or by contractors, there is no substitute for accurate knowledge of the land and its needs. Ill-advised or half-way conservation measures can lead only to unnecessary expense and waste of soil and water, such as can no longer be afforded in this or any other country.

We have learned these underlying principles of soil conservation through experience; there's no guessing about it. The Soil Conservation Service started out on a demonstration basis; but we changed as quickly as possible to our present method of furnishing technical assistance to each farmer, on site. We made this change because it became evident that demonstrations, even though highly useful for preliminary educational work, would not get permanent conservation on the land quick enough.

QUALITY OF SOIL-CONSERVATION WORK

There is no substitute for quality and completeness in the protection, development, improvement, and proper use of our land and water resources. Each acre of land must be used according to its individual capabilities and treated according to its needs; because each acre of land, like each human being, is different from any other acre. To get the best from it, it must be handled in just the right way. Likewise, each watershed, whether large or small, must be used and treated according to its specific physical peculiarities. If we are to properly conserve, develop, and use the water and land resources of that particular watershed—any watershed.

If there were some simple remedy for our land and water problems that could be applied everywhere, according to a standardized treatment or formula, the job would be relatively easy. But there are as many variations in soil- and water-conservation problems as there are in the landscape, the climate, and the types of agriculture that farmers choose to practice. There is no cure-all, no short to the solution of these problems. Nothing less will suffice than a painstaking study of each acre, each field, and each watershed, and the appropriate application of all needed conservation measures that the study indicates as necessary to get the job done right. To ignore these facts is to invite further damage to the land, as well as to waste time, opportunity, and money.

RECOMMENDATIONS FOR GETTING THE CONSERVATION JOB DONE IN TIME

What are the steps which hold the greatest promise for bringing about permanent conservation, as well as safe and orderly management of the farm lands of a country? Can these objectives be achieved without

serious disruption of the economy of a people?

The answer to the last question is "Yes." As to the steps which give the greatest promise of success in protecting and developing our farm lands, there are several. No single one of them, however, seems adequate by itself to bring about the desired results, in time, on most land. It is the appropriate combination of essential steps which provides the greatest assurance of accomplishing the end we want.

Among the more important things that should be done at the earliest possible time in this country are the following:

1. Set up a timetable for the establishment of those basic measures needed for the conservation of our soil and water resources, according to capability of the land and availability and need of the water.
2. Adjust research in conservation to specific problems encountered in field work and intensify research on these pressing problems.
3. Encourage and promote a comprehensive program of conservation education through all available educational agencies and institutions.
4. Complete land-capability surveys of the country and analyze the information to provide land facts needed for future farm planning and action, and for other programs, such as a sound basis for farm credit, farmland assessments, etc.
5. Encourage continued organization of soil-conservation districts, in order to develop conservation programs with local leadership and direction.
6. Improve the conservation credit structure.

Progress in Soil Conservation

EXTENSION OF REMARKS OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave granted to extend my remarks in the RECORD, I include the following address by H H Bennett, United States Soil Conservation Service, distinguished lecture series, University of Arkansas, Fayetteville, Ark., March 7, 1950:

PROGRESS IN SOIL CONSERVATION

(By H. H. Bennett)

PUBLIC RESPONSIBILITY

From every conceivable angle of consideration—economic, social, cultural, public health, national defense—conservation of natural resources is an objective on which all should agree. It is also a need which all should recognize. The public—our society as a whole—has a vital stake and, therefore, an enduring responsibility in these resources. Exercise of the public responsibility in the sustenance of agricultural land is of such obvious importance to the general welfare of all people, it would seem that an adequate program of soil conservation and prudent use of water would always be the first order of business in all nations.

With the understanding that can be developed through education, there should be little or no opposition to sound conservation action, persistently carried out. There are likely to be, spottedly, misconceptions, unwise proposals for alleged short-cuts and panaceas, and occasional bickering arising out of ignorance and the common error of

taking things for granted. These deterrents represent a type of human behavior that probably can be dealt with most effectively through the educational process.

Public interest in making the wisest possible use of all of a nation's natural resources is, in a sense, of greater importance than the individual's interest, but both are tied together in such a completely complementary way, there is no point in pursuing the subject beyond indicating that no man should have the right, legally or otherwise, to wrecklessly destroy or unnecessarily waste any resource on which public welfare is dependent. Willful destruction of those resources essential to life amounts, in the end, to a form of inflicting fatal privation.

Productive land occupies a position of such basic importance to everybody that some individuals have come to favor public control in the use and management of land. They contend that because of man's utter dependence on the limited supply of land, the question of how land is to be used should not be left entirely to individual discretion.

Our American experience, however, seemingly has developed a majority feeling to the effect that our soil-conservation efforts should proceed along lines of cooperative action, without the use of compulsion at any point, at least until there has been time for adequate education and action. The present national program of soil conservation, under which the Government supplies, on request, technical assistance and certain materials to soil-conservation districts, has become highly effective and very popular. Excellent progress has been made without public use of anything stronger than persuasion and cooperation. There have been, however, many instances where farmers have not brought themselves immediately into active cooperation in this conservation program. Delays have resulted from such action on the part of farmers, and, in turn, these have caused difficulties and hardships for their neighbors, but such situations have usually cleared up through the educational process.

Under State laws many of the soil-conservation districts have been given legal authority to impose land-use regulations through the process of local referenda, but the authority has rarely been exercised. At this time it appears to be the feeling of the great majority of soil conservation district supervisors that many of the farmers who move slowly at first later on become the most enthusiastic and effective kind of conservationists. Accordingly, they see no need to propose the use of compulsion. Moreover, they have been impressed by the fact that nearly everywhere farmers are requesting technical help for the establishment of soil-conservation practices on their land faster than such assistance can be provided.

While there is universal recognition of the need for increased speed in soil conservation, it appears to be generally believed this can be obtained without resort to any form of regulation.

Too long a delay in getting soil conservation on the land, however, could bring about public demand for increased speed through the use of some measure of land-use regulation. It is not difficult to understand how the refusal of a farmer to protect his own land from erosion can do serious damage to an adjoining farm, as where, for example, uncontrolled gullies pouring out infertile sand, gravel, or subsoil clay, spread these materials over lower fields which have been given all the protection the neighboring farmer can provide through his own endeavors.

It would seem that some means of protection is justified on the part of the farmer whose lands are being damaged in any such manner. If, however, the farmer owning the gullies feels that he is unable to control them because of financial circumstances, or

because of lack of manpower or knowledge, it might be advantageous to both parties if some satisfactory arrangement could be worked out to get the job done cooperatively. On the other hand, different circumstances might call for public action of some kind, particularly where there is evidence of willful carelessness on the part of the farmer who refuses to do anything to protect his neighbor's land by protecting his own.

One serious difficulty in such instances is that it is not always easy to determine whether or not failure to act arises out of willfulness, lack of concern, lack of education, natural tendency to move slowly, or what. In a good many instances, where obstinacy seemed to be the principal difficulty farmers have been persuaded to take corrective action or have somehow come to understand, through their own observations or matured consideration, the error or injustice of their actions, with the consequence that they have gone vigorously about the job of remedying the situation.

From the standpoint of the Government's obligation to help farmers with their erosion problems, there seems to be general agreement. A few people, however, try to make the point that the Government should not concern itself with helping a farmer protect and improve his farm land any more than it should pay part of the cost of operating a privately owned and normally run manufacturing plant.

The exceedingly important difference such objectors fail to see is that the Government's interest in the continuing productivity of the land is never-ending. Government dies if the land is ruined for further production. In other words, land is the individual's property for the moment and the Nation's most priceless and indispensable resource for all time. There is much difference here, but the interests of both should be protected.

Over and above these considerations, productive land is the principal source, directly and indirectly, of the income required for the support of most nations.

A CONSERVATION TIMETABLE

Inasmuch as the time factor is so important in reckoning the rate and amount of land damage, it would seem, as already indicated, highly advantageous to establish a timetable for conservation operations, so that the necessary conservation progress from year to year could be clearly set forth, and adequately provided for. And, in all probability, a definite goal would prove advantageous from the standpoint of emphasizing the point that the quicker the job is done, the easier it will be and the lower its cost.

Enough is now known about the size of the job, as well as the speed required to complete it, to establish such a timetable. Furthermore, by looking at the whole soil-conservation and land-use job remaining ahead, it should be possible to determine much more clearly just how much of it should be done, and how much of it can be done, in any one year or any given number of years. There would seem to be reason for serious consideration now of an advance schedule, covering the years ahead, which would lead to the permanent protection of our productive land before it suffers irreparable damage on a very large scale. Such an advance schedule, if it could be agreed on, would provide for much more economic conduct of the necessary conservation job.

As pointed out, most farmers need trained technical aid in installing water-disposal systems and other conservation measures that are exacting to build or apply. Today the technicians available for this work are being taxed to the utmost. The widespread and growing recognition of the hazard of erosion and other forms of land depreciation, and of the advantages of conservation, has sharply increased the demands of farm-

ers for this kind of technical service. Even now, there are not enough technicians to meet current demands.

With about 115,000,000 acres of cropland being damaged at a critically rapid rate, and approximately 120,000,000 acres of additional cropland being damaged at a serious rate, there is clearly no time to waste on postponement. Within the next 20 to 25 years, this area will have lost an important share of its capacity to produce, unless it is protected in time. Such loss is more than the Nation can afford, and it is unnecessary. We now have good reason to feel that the necessary basic conservation measures could be applied to the land within 10 to 25 years.

At the current rate of soil-conservation treatment, however, some 40 years would be required to make the necessary shifts in land use and apply the needed conservation measures on the farms still untreated. In short, the present technical resources available are inadequate for the size of the job ahead, even though the Soil Conservation Service, during the past 17 years, has gathered together a technical staff of thousands of trained and experienced soil conservationists. It has taken years of training and experience, actually doing conservation work out on the land, to build up this technical staff. It is the largest and most experienced group of conservation technicians ever brought together. Yet, this group is not large enough. It should be increased, and it will take time to train properly a sufficient number of additional technicians to satisfy the current demands of farmers in soil-conservation districts; and it will take still more time to train and increase this staff if we are to speed up the rate of conservation work so as to get the job done in the next 20 to 25 years.

ADVANTAGES OF DEVELOPING SUBMARGINAL LANDS

Tracts of eroding or naturally poor land are often a physical hazard to adjoining areas of good land or a barrier to their economic development. Although the size of individual parcels of such submarginal lands may not be large, the damaging effects of such tracts often extend to much larger total areas of interspersed good land. These submarginal lands are one of the chief obstacles to widespread conservation in many localities. There are almost always other reasons, of course; but often the submarginal lands are the key to the situation. When such submarginal lands become a festering point in an otherwise sound farming community, and if there is no apparent chance of solving the problem while the lands remain in private ownership, then it would seem appropriate to seek another remedy.

When desirable in the public interest, the Government could very well afford to purchase and improve (1) such areas as would be permanently lost for agricultural production if retained in private ownership or (2) such areas as would constitute a permanent erosion hazard to adjoining productive land if left in private ownership. Once such lands have been protected, and developed in accordance with their capability for safe use (almost invariably this is a limited use, because of the highly vulnerable nature of these lands), they should be kept in Government ownership and management in such a way as to provide the greatest possible benefit and use to neighboring private landowners and to the community—until necessary and satisfactory arrangements can be worked out for safe return through sale, under restricted use, to those who can show evidence that they will efficiently manage and maintain such improved lands.

In the course of making essential shifts in land use in accordance with the capabilities of the many different parcels of land, it sometimes becomes desirable to enlarge the size of farms in order that they can be operated efficiently and profitably. In other

words, farms may simply be too small to provide their owners with an adequate income. Such situations often lead to exploitative farming. Under these circumstances, it would seem to be in the public interest to purchase nearby tracts of submarginal agricultural land, particularly areas of excessively eroding land, for protection, improvement, and subsequent sale to farmers in need of additional acreage. Wisely and promptly handled, such purchase, development, or improvement, and sale would not only help prevent permanent damage to the lands purchased but also to adjoining lands. This would help the owners establish economically sound units that would produce permanently under a conservation farming system.

Inasmuch as soil conservation districts are vitally concerned with the conservation and proper use of lands within their boundaries, they should be a prime factor in all activities involving the purchase, development or improvement, management, and final disposition of lands which cannot be placed under effective conservation use while in private ownership.

Each district, with whatever assistance is available, could determine what lands need to be placed in public ownership and restored or protected with public funds. However, since the districts have very limited authority or ability to raise funds, any activity involving the purchase and improvement of any significant acreage would probably have to be financed by other public agencies. The agency or agencies best able to assist the district in such activities would depend on the magnitude of the job, the pattern of purchase, the best future use of the land, and other factors. Present sources of assistance include county, State, and Federal conservation agencies having authority to buy land.

In some instances it may be advisable to purchase and improve submarginal agricultural lands in furtherance of flood control operations. In this connection it may be desirable to have flood-control legislation provide more adequate authority for the management and disposition of acquired lands. In any event, after development or satisfactory improvement, it would be desirable, in most instances, to transfer title or management authority to state or local agencies—to soil conservation districts in particular.

A good many of the submarginal areas now administered by the Soil Conservation Service are paying their way; some that were largely tax delinquent when acquired are turning considerable sums into the county and the Federal Treasuries as the result of their earned income—in some instances more than the lands ever earned.

WHY THE EROSION PROBLEM WAS NOT RECOGNIZED

How did we get into this predicament with respect to our land? Why was it allowed to happen?

There are a number of reasons for our long delay in recognizing the menace of man-induced erosion and in starting an effective program of prevention and control, but the following are probably the main ones:

1 Man began losing land to erosion when he first started farming it or began intensive grazing, but for countless generations there was always more land in the next valley or across the mountains. Land was so readily available, people came to regard it as limitless and inexhaustible; it was easy to view the situation that way. This erroneous conception persisted, especially among people of newly settled countries, as time went by, and it was probably not until North and South America were settled all the way to the Pacific coast that people began to have any doubts about the myth of land plenty.

2 The apparent abundance of good land for so many generations gave rise to a careless and prodigal attitude. There were no prevailing attitudes to cause a landowner to take care of his land or even be concerned about maintaining its productivity. New land, everybody thought, could almost always be had somewhere else.

3 Even in modern times our leaders have too often had little or no personal knowledge or understanding of the land. They have been trained in law, medicine, finance, trade, philosophy, astronomy, military science, economics, political economy, education, or some field other than agriculture, and especially that vitally important part of agriculture having to do with maintenance of the agricultural base—the productive land. With few exceptions, until recent years, they had had neither the training nor the incentive to look searchingly at the landscape around them and understand what was happening to it. The ancient and unchallenged myth of land plenty came down to them, too, across the ages and was unfortunately accepted as truth.

4 In many parts of the world too much of the land traditionally has been in the hands of inexperienced, untrained operators. During recent years, this situation has changed for some countries, fortunately for the better. However, over most of the world, land is still being used by men with little specialized or adequate training for the job. Too many land users have operated on a trial-and-error basis and have been influenced predominately by habits handed down from the past, whether good or bad. Some have placed greater faith in superstition than in science. In short, the most precious natural resource on earth in many parts of the world has habitually been in the charge of those who often have had no greater qualifications for the trusteeship than the coincidence of inheritance or of birth on the land.

5 Too few farms have produced surplus capital for the owner over a period of years. On the contrary, the farm much too often has been no better than a marginal subsistence enterprise. Even in the United States the farmer rarely has had the personal resources or training to undertake research or seek out technological improvements. He has generally been almost wholly dependent on outside help, from Government or private sources, to provide him with improvements in machinery, materials, and methods. Too often he has not even thought of including in his calculations any cost for depreciation or maintenance of his basic plant—his farm land.

6 Our agricultural scientists failed almost completely, for the most part, over bygone years, to recognize land for what it is—an important and complex resource. Too often they considered soil permanent and synonymous with land. As a result of this error, both agriculture and the land suffered. Soil is but one part of the land. For all practical purposes, land must be regarded in terms of all its component parts of soil, slope, climate, susceptibility to depreciation by erosion and other processes of deterioration. Some geologists saw very clearly what was going on, as N. S. Shaler and T. C. Chamberlain, but no one drove ahead to get necessary funds and legislation for research or control.

Many of the early scientists largely ignored erosion, paid too little attention to slope, called the weather inevitable, and allowed the problem to go untouched. Only a few recognized the difference between the tediously slow process of geological erosion and the exceedingly rapid process of man-accelerated erosion following the removal of nature's stabilizing cover of vegetation and the plowing of the land.

In the main, agricultural science was not greatly concerned about what changes were

taking place on the land. It was primarily interested in the process of soil formation, in soil classification, and in the mapping of soil types; in the chemical and physical composition of soils; the health and breeding of livestock, improvements in strains of crops; and in modernization of machinery and equipment. All of this was important and beneficial, but it did lead to serious neglect of the capital stock of agriculture and the source of agricultural production—the land itself.

7 In agriculture as in other enterprises, we often have waited until we were sick before calling the doctor. We did not practice preventive medicine, and now we must try to cure a malady—erosion—that has gotten into our system and weakened the land and ourselves.

SOIL CONSERVATION DISTRICTS

It is my conviction that the farmer-voted and farmer-managed soil conservation districts, through which the Soil Conservation Service makes available virtually all of its technical and certain other assistance to landowners and operators, represent the greatest land movement of all time. It is through these democratic units of State government that the soil and water conservation job on the farm lands of the Nation is being done in an effective and lasting manner—as never before achieved anywhere.

The districts are in an ideal position for the landowners and operators to work together and take advantage of counsel and assistance of one another, as well as of other local State, Federal, and private sources.

Back at the time when the districts were getting under way, I never would have believed that in the short space of a dozen years—starting in 1937—every one of the 48 States, as well as our Territories of Alaska and Hawaii and insular possessions of Puerto Rico and the Virgin Islands, would have enacted these district laws, so promptly taken advantage of by the landholders. More than three-fourths of the Nation's farms are now within the boundaries of the nearly 2,200 soil-conservation districts already established, by what usually has been the overwhelmingly favorable vote of the landowners themselves. The districts now cover nearly 1,200,000,000 acres, including more than three-fourths of the Nation's farm land. Nine States are completely covered by districts and many others nearly covered. Up to July 1, 1949 (the beginning of the present fiscal year), farmers and technicians of the Soil Conservation Service, working together out on the agricultural lands of the country, in soil-conservation districts alone, had prepared cooperatively some 800,000 complete soil conservation farm plans. These plans covered by that date over 200,000,000 acres, of which more than 100,000,000 acres had been treated with conservation measures in whatever combinations were required to give adequate protection to the land.

GROUP ACTION

Not only are farmers in soil-conservation districts becoming more neighborly and helpful to one another in conservation work, but groups of farmers, living in more or less compact neighborhoods within districts are contributing in a most encouraging manner toward speeding up conservation work by planning together and working together, loaning one another machinery and seed, and cooperating in other ways. These groups are normally bound together by ties of neighborliness and common interests. The groups usually range from 4 or 5 to 15 or 20 families, sometimes more.

The Soil Conservation Service is now working with some thirty thousand of these natural groups. An increasing number of governing bodies of soil-conservation districts are finding that it is comparatively easy to

organize and determine the membership of these groups and seek out their leaders, and to interest them in conservation. In a great many instances these groups, under these leaders, are coming together in planning and application meetings. They are helping the district supervisors and their own neighbors in routing equipment, distributing seed, and meeting seasonal farm needs. It has long been known that people like to work together. Many people work in groups far more effectively than as individuals. There is a certain stimulus to morale in the act of working with friends and neighbors for a common beneficial purpose.

Recently the leader of a typical neighbor group in Texas said, "We like this group way of doing things. One helps another and is helped in return. One learns what another is doing and wants to do likewise. . . . we save in transporting seeds for the whole group. . . . hauling fertilizer. Naturally it speeds up the application. . . . since working together we become more interested. . . . it makes for better group spirit."

Group action is a perfectly natural instrument for getting soil conservation accomplished. It brings out the initiative of the people themselves and makes highest use of their natural desire to help one another solve common problems. Group leaders are more and more becoming right-hand men to district supervisors, not necessarily by official designation but by their unselfish work in assisting the district to reach people more rapidly and more effectively.

The Leadership of Marriner S. Eccles of the Federal Reserve System, 1935-51

EXTENSION OF REMARKS

OF

HON. DANIEL A. REED

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. REED of New York. Mr. Speaker, under leave to extend my remarks, heretofore granted, I am inserting a review by Dr. Walter E. Spahr covering the essentials of Marriner S. Eccles, the Reserve Board, the Treasury policies since 1934. It presents some of the fundamental contentions in New Dealism, and provides some factual evidence to refute these contentions:

THE LEADERSHIP OF MARRINER S. ECCLES OF THE FEDERAL RESERVE SYSTEM, 1935-51

(By Walter E. Spahr, professor of economics, New York University; executive vice president, Economists' National Committee on Monetary Policy)

Marriner S. Eccles' book, *Beckoning Frontiers: Public and Personal Recollections* (Alfred A. Knopf, New York, April 1951), pages xii, 449, viii, edited by Sidney Hyman of the Franklin D. Roosevelt Foundation, provides an account of the Eccles family and fortunes and of his life in Washington as a Treasury official in 1934 and as a Governor and Chairman of the Board of Governors of the Federal Reserve System, 1935-51. It describes the economic and political theories developed by him, particularly during the years of the economic recession and depression, 1929-33, and his efforts to make his theories effective in Washington. It outlines his efforts to reconstruct the Federal Reserve System in accordance with his theories, which involved making the System an integral part of New Dealism and of Presidential policies until Eccles lost influence

with the President, and his contentions thereafter as to the desirability of establishing the independence of the Federal Reserve System. It provides an account of some of his other activities in Washington up to the time of the severance of his connection with the Board of Governors of the Federal Reserve System in June 1951.

SIGNIFICANT THEORIES ADVOCATED BY ECCLES

The book reveals that Eccles embraced (1) the theory (held until the latter part of his official life in Washington) that the Federal Reserve System should become an integral part of the policies and a tool of the executive branch of the United States Government; (2) the under-consumption theory of the business recession of 1929-33, if not of business recessions in general, his contention being that there was too much saving and not enough spending; (3) the theory of a compensatory economy, that is, Government action to offset wide fluctuations in business activity; (4) the stagnation theory—the notion that, since our geographic frontier had disappeared, economic stagnation confronted us unless radical and revolutionary policies such as he urged, which in the main characterized the New Deal, were pursued; (5) the contention that the Federal Government should become much more potent as against State and local governments and private enterprise in the management of the people's affairs; (6) the contention that "the" problem is more one of distribution of income than of production; (7) the notion that trouble arises unless all current income is spent; (8) the contention that the only way out of the economic recession and depression following 1929 was by a program of adequate Government spending; (9) the idea that a new kind of thinking and a new kind of prophet were called for—those that embrace what he calls "logical radicalism"; (10) the contention that there should be a redistribution of purchasing power and a better allocation of income between investment and other expenditures; and (11) the notion that economic principles change over relatively short periods of time.

Considering the fact that, for most of his years in Washington, Mr. Eccles was Chairman of the Board of Governors of the Federal Reserve System and tended to be the dominant influence in directing its policies, probably the most significant feature of his theories, policies, and leadership is in his efforts to make the Federal Reserve System an instrumentality of the Executive rather than an independent agency dedicated to the purposes, appropriate to a properly constructed central banking system, and to those provisions in the Federal Reserve Act of that nature.

THE ECCLES THEORY THAT THE FEDERAL RESERVE SYSTEM SHOULD BECOME AN INTEGRAL PART OF EXECUTIVE POLICIES

That portion of his book which deals with his activities from the time he entered the United States Treasury in February 1934 until Vinson and Snyder became, successively, Secretaries of the Treasury, and, as compared with Eccles, obtained the ear of the President, reveals his efforts to make the Federal Reserve System an integral part of New Deal and Executive policies. The latter part of the book, which deals chiefly with events during the administration of President Truman and particularly those of Vinson and Snyder as Secretaries of the Treasury—roughly during the years 1946 to 1951 (p. 421)—shows a marked reversal in basic contentions on the question of the importance of maintaining the independence of the Federal Reserve System. This reversal seems to be emphasized after Eccles learned of President Truman's failure to reappoint him Chairman of the Board. He recognizes that this reversal has been attributed by some to personal pique (p. 458), because of the President's refusal to reap-

point him as Chairman of the Board, but he places himself in the position of one who believed then that "we should . . . adjourn political considerations . . . and consider honestly and openly the economic facts of life" (p. 459).

The efforts of Eccles to make his theories effective and to convert the Federal Reserve System from an agency, designed to be an independent one in nature, to an arm of the Executive, began in the main with his testimony before the Senate Committee on Finance in February 1933 (Investigation of Economic Problems, Hearings Before the Committee on Finance, United States Senate, 72d Cong., 2d sess., pursuant to S. Res. 313, February 13-28, 1933, pp. 703-733), which he regarded as a sounding board for "a new kind of thinking" (p. 82). His description in his chapter Cross-Examination of that hearing deals with his general program of how best to obtain economic recovery and prosperity, and reveals relatively little in the form of specific statements as to how the Federal Reserve System was to be made an integral part of Executive policies. Nor does it reveal clearly (in the appropriate places, pp. 106-107) that in that hearing he advocated the issuance of fiat money (hearings, pp. 720-723). To the Eccles proposal to give away money to the States, Senator Walsh, of Massachusetts, remarked that the suggestion "seems to me to be preposterous" (hearings, p. 716). Said Senator Gore, of Oklahoma: "It seems like every scheme you suggested was for the Government to advance money to somebody" (hearings, p. 732).

From page 730 of the hearings:

"Mr. ECCLES. I am a capitalist.

"Senator SHORTRIDGE (California). Well, I am a capitalist. But I am on the gold basis."

Says Eccles in his book (p. 104), of that hearing:

"When it came my turn to be called before the Finance Committee, I challenged all that had been said up to that point and was practically alone in doing so. . . .

"What I said was received with astonishment by those who expected all bankers to wear the old school tie, and with relief by the few members of the committee who saw that I wore a western tie."

"The urgency to overhaul the Federal Reserve System," by the Banking Act of 1935, particularly title II of that act, so that the system could aid the President in his work-relief program, is pointed out on page 187 of the book. As of December 17, 1934, Eccles indicates disapproval of Senator Glass' "persistent efforts to maintain the independence of the Federal Reserve banking system" (p. 194).

On page 258, he says: "Since the Federal Reserve System is called on to do what it can to maintain economic stability it has a vital interest in the fiscal policies pursued by the Government. On the other hand, the Treasury Department, which borrows, taxes, and spends, must be assured that the Reserve System, within the limits of its power, will create monetary and credit conditions of the sort that will help the Treasury carry out its responsibilities."

All that was a notion or theory of Mr. Eccles. The Federal Reserve Act does not provide that the system "is called on to do what it can to maintain economic stability"—and what does economic stability mean—nor does it provide that the Treasury must be assured by the Reserve System that it will, within its power, create monetary and credit conditions that will help the Treasury carry out its responsibilities.

Another example of the Eccles theory that the Federal Reserve System should be employed to foster New Dealism in the following (p. 266): "With the New Deal's great victory 1 week before (in November 1936), those of us in public office, each in his own sphere, felt we could at last write the full ticket of things we thought would best serve the needs of the country."

The repeated visits of Mr. Eccles at the White House, in connection with his efforts to foster New Dealism and to suggest programs for the Treasury and other departments of Government, reflect in part his efforts to make the Federal Reserve System an instrumentality of the Executive and a means of furthering its policies. Avoidance of the President's office and of other policy-making officials, in an effort to maintain the independence of the Reserve System of political and Executive control, was definitely not a part of the thinking or procedures of Mr. Eccles. Indeed, his efforts were to make the Board of Governors and the System a potent force in fostering the New Deal for which he seemed to regard himself as a prophet (p. 113) and a precursor of the Keynes theories (p. 132). His book indicates that he not only wished, and endeavored, to do all within his power to make effective what he calls his logical radicalism but that he worked persistently to make the Federal Reserve System an important tool with which to effect his aims. Said Eccles (p. 122): "Unlike Hamlet, I did not curse my fate that I was born to set the world aright. I had asked my questions for 3 years, reached what I thought were true answers, and, never being given to modesty, I felt that those answers could set the world aright if only men in high places listened to them."

One of the characteristics of the Eccles book is that while it shows his efforts to make the Federal Reserve System an integral part of New Dealism and of Executive policies, one finds scattered through it passages on the virtues of the independence of the System. For example, from page 270: "The only real security against these forces [political pressures of the moment]—all of which aim to get the short-run benefits at the price of long-run trouble—lies in a single strong, independent, nonpolitical, but public body [Board of Governors] that would attract to its membership the best talent in the land, that would have the respect of the country as do the Federal courts and the Interstate Commerce Commission; that would have continuity in its position of independence, that, because of this, could make decisions free from the political winds that call for expedient decisions rather than right ones in the field of monetary and credit policy." From page 254: "But Roosevelt agreed with me that such action would be highly inappropriate. It would violate the organic conception of the Board of Governors as an independent agency of the Government."

Although that principle of independence is stated on still other pages, the picture revealed by the book, and by evidence not in it, is one showing how the System was made a tool of the Executive by Mr. Eccles and those who cooperated with him in that enterprise.

Instead of the Reserve Board making its recommendations directly and exclusively to Congress, who created the Federal Reserve System and to whom the Board of Governors is required to report, Eccles pursued a practice of presenting a high percentage of his proposals to the President for prior approval and for recommendation by the President to Congress. If the President did not adopt an Eccles recommendation, the latter often did not carry it to Congress directly. This procedure made Eccles and the System subservient to the President.

For example, from pages 282-283: "I would very much like to see you [the President] put squarely up to Congress the responsibility for acting or failing to act, not only in improving the present unsatisfactory set-up with respect to Federal banking supervision, but in providing authority to deal with such emergencies as may arise." As a further example (p. 285): "Following this discussion [of May 15, 1939, on how to head off the

Brown bill], the President called in one of his secretaries. As if to quiet my doubts as to what he would do, after more than 2½ years of indecision on this point [of bank unification], he dictated in my presence a memorandum to Senator Wagner. * * *

"It was with a buoyant mood that I left the White House that day."

From page 289: "On July 9, 1936, I called at the White House and presented this issue [of changing reserve requirements] to Roosevelt, though under the Banking Act of 1935 the Board could change the required reserve without his approval. Yet I felt the country would hold him responsible for whatever was done. Therefore, as the liaison officer between the Board and the President, I explained why we proposed to order a 50-percent increase in the required reserve."

From page 292: "I insisted that he [Morgenthau] and I see the President before anything was done. * * *

"I assured the President that if in a week's time we did not stabilize the price of Government securities through open-market operations, I would be the first to favor what Morgenthau wanted done. * * * Roosevelt gave me the week's grace for which I asked."

"Thereafter new instructions were sent to the New York Reserve Bank [the agency which executes the orders of the Federal Open Market Committee] which could not be misinterpreted."

From one of his letters to the President (p. 317): "If the Secretary of the Treasury were to make a public address very shortly explaining the soundness of this case, it would pave the way for others to follow up."

"Once he has presented the case officially for the administration, it will be much easier for the rest of us to follow up, acting under his leadership and avoiding the appearance of dissension within the ranks or encroachment upon the Treasury's domain."

From his page 318: "My associates on the Board of Governors strongly opposed my getting any further involved in a counterattack on the views expressed by Senator Byrd. They said that I would drag the whole Reserve System into a partisan political fight and thereby destroy its role as an independent agency. To this I replied that I should continue to join issues with Senator Byrd—not for the sake of defending the political fortunes of the President, but to defend the economic ideas that had brought me to Washington and kept me there so long. Furthermore, in doing this, I would try to make it clear that I was expressing my own views and not those of the Board."

From his page 320: "I had not yet left the radio station after the broadcast when a call came to me from the White House, Steve Early was at the other end."

"Mortimer," he said, "I want you to know how much the boss appreciated your speech. Here you are, with much less reason to stand up for him than many others, yet you were the only one who did it."

From his page 355: "Long before the report [to Congress by the Federal Advisory Council, Reserve Board, and presidents of the Reserve banks, page 353] was made public, I had shown it to the President and explained it was a substitute for the blast the Federal Advisory Council wanted to issue [a statement, says Eccles, page 353, "that raked administration and Reserve policies from stem to stern"]."

From a letter to the President, January 17, 1941 (p. 357): "Unless I have the benefit of guidance that only you can give to us here, the confused situation makes for complete frustration and discouragement. After 7 years of battling for New Deal objectives, I do not propose to give in to the banker viewpoint, and I feel a deep sense of injustice at any such false imputation."

When Eccles reaches his chapter on "A House Divided," beginning on page 382, of a book containing 499 pages, he reveals how the Board of Governors had fallen under the domination of the Treasury. Said he (p. 382): "By the fall of 1943 my work in Washington had largely settled down to a routine administrative job. The pattern of war finance had been firmly established by the Treasury, the Federal Reserve merely executed Treasury decisions."

Up to this point—in general—he had worked to make the Federal Reserve System an integral part of New Deal policies, and, as a part of such effort, he had attempted to dominate Treasury policies. Failing in the latter, and finding instead that the Federal Reserve System, as a result of his policies, was at that time geared to, and in high degree controlled by, Treasury policies, he began to rebel. This rebellion seemed to find its first outlet, as revealed by the book, in his efforts to unify the banks of this country—that is to force all State commercial banks into the Federal Reserve System.

From his page 384: "Shortly after Roosevelt returned from the Tehran Conference, I had a chance to discuss Federal Reserve matters with him. I told him that the Board of Governors had come to have few or no responsibilities beyond the discharge of mechanical duties, and that under these circumstances there seemed little point in my remaining on the Board once my term expired, in February 1944."

From his page 421: "Theoretically there should be no clash between these two objectives [the functions of the Treasury and Federal Reserve System], but one did arise after the war over the continuance of the cheap-money policy of the wartime period (heavy deficit financing). This conflict has continued up to the present time. * * *

"With the end of the war in sight, I felt that the fixed pattern of rates used to finance our huge war expenditures was no longer justified, that the Federal Reserve should adopt monetary and credit policies appropriate to postwar conditions in the economy rather than policies, which the Treasury desired, that were based solely on the cost of carrying the public debt."

From his page 422: "But the suggestion of change stirred up a hornet's nest of opposition in Treasury circles. * * * Indeed, it was the continued domination of Treasury policy by a Morgenthau staff, with its chronic bias for cheap money in all seasons, that lay at the source of this and many other difficulties."

From his page 424: "The Secretary of the Treasury [Vinson] implied that we were proposing to stage a sit-down strike in refusing to carry out Treasury policy. On the other hand, it was clear that if we carried out Treasury policy we would default on the obligations Congress imposed on the Reserve System in the field of money and credit."

From his page 425: "As I now look back over this period when I was Chairman of the Board of Governors, I regret that the Federal Reserve did not take a more independent position despite Treasury resistance. There was no justification for our continued support of the Treasury's wartime cheap-money policy."

From his page 430: "Secretary Snyder correctly insisted that the field of money and credit was the primary responsibility of the Reserve Board and that I should speak for the Board and not for the administration when the President's inflation-control program was considered by Congress."

From his page 431: "The Joint Committee on the Economic Report, then under the chairmanship of Senator Taft, was the first congressional body to hold hearings on the President's message. * * * Had I been in any way sensitive to political currents, I

suppose I would have softened my words. But speaking on behalf of an independent agency and with no political ax to grind, it seemed appropriate to speak the truth as I understood it."

With this description of the Board of Governors as an independent agency and with Eccles stating that he had no political ax to grind, one sees an almost complete reversal in the policies and contentions of Mr. Eccles. It may be recalled that in pressing for his earlier policies he had stated (p. 266) that the Treasury "must be assured that the Federal Reserve System, within the limits of its power, will create monetary and credit conditions of the sort that will help the Treasury carry out its responsibilities," and that, in respect to having no political ax to grind he had pointed out (p. 357), how he had been battling for 7 years "for New Deal objectives."

From his page 431: "They [the bankers] contended publicly that the existing powers of the Board were more than adequate for the needs, even though they privately knew those powers could not be used by the System so long as it was required to support the Government securities market at existing prices." The question not answered by Eccles is, Who required the Federal Reserve System "to support the Government securities market at existing prices?"

By 1947, in connection with his efforts to force prosecution of the Transamerica Corporation, San Francisco, as a monopoly, Mr. Eccles found that it was Secretary Snyder rather than he who had the ear of the President and that the Treasury was in a position to control the action of the Board of Governors in ways extending beyond the question of the support of the prices of Government securities. On his page 447 he relates how the Attorney General wrote him as follows: "The Secretary of the Treasury had asked that he be advised of any matter pertaining to Transamerica that may come to the attention of the Attorney General. Upon receipt of your letter, I felt obliged to send it to him."

On December 1, 1949, Eccles wrote to a Senate committee as follows (p. 460): "Under these conditions [of Treasury domination] it can hardly be said that the Federal Reserve System retains any effective influence in its own right over the supply of money in the country or over the availability and cost of credit, although these are the major duties for which the System has statutory responsibility." Continuing his thought, on page 461, he points out that if Congress permits the present arrangement to continue "Congress should recognize that the responsibilities for monetary and credit policies are with the Treasury and not with the Federal Reserve System."

"Treasury financing," says Eccles (p. 462), "can be carried out successfully within the framework of a restrictive credit policy, provided the terms of the securities offered are in accordance with that policy."

From his page 481: "... I reluctantly went along with a cheap-money policy during the war years when we faced the need to finance huge budgetary deficits. But there was no justification for such a policy in the period between VJ-day and the present. ... There was no justification for the Treasury's insistence that the Federal Reserve System adhere to a policy of purchasing Government securities at the will of the holders and at fixed prices. Such action did not assure confidence in the credit of the Government."

From his page 492: "... What we [the Board of Governors?] wanted was an orderly market in which the Federal Reserve maintained control, but where freedom of action would be permitted so as to reflect more nearly the real demand by private investors."

One reason for price increases in the last 7 months of 1950, says Eccles (p. 493), was that the existing supply of money "was greatly expanded by an abnormal and rapid growth in bank credit made possible by the Federal Reserve supporting the Government security market on the basis of the Treasury's cheap-money policy."

On page 485, he points out that the members of the Federal Open Market Committee, which includes all members of the Board of Governors of the Federal Reserve System, "are responsible only to Congress for carrying out their statutory responsibility." That statement is far removed in principle from his contention advanced in 1936 (p. 289) that he was "the liaison officer between the Board and the President" and his statement (p. 292) that "Roosevelt gave me the week's grace for which I asked" to stabilize the price of Government securities.

On page 486, Eccles says that "as Chairman, it would be difficult for him [McCabe] to oppose it [Treasury policy] publicly without resigning." If the Board is responsible only to Congress, as Eccles was able to say by the time he reached page 485, it is not clear as to why the Chairman of the Board would be compelled to resign because he opposed a policy of the Secretary of the Treasury. The Eccles statement implies that the Chairman's responsibility is to the President rather than to Congress as he contended on page 435.

Reviewing President Truman's call to the White House, January 31, 1951, of the Federal Open Market Committee, which includes the Board of Governors, Eccles remarks (p. 486): "This is the first time in the history of the Federal Reserve System that a President called either the Reserve Board or the Federal Open Market Committee to the White House for the purpose of discussing or influencing their policies. Until this instance the dictum laid down by Woodrow Wilson and reported by Senator Glass in his book *An Adventure in Constructive Finance*, had been adhered to by all our chief executives. Glass had asked Wilson, the 'father' of the Reserve System, why he did not establish closer relations with the Reserve Board he had created. To this Wilson is quoted as saying: 'The very moment that I should attempt to establish close relations with the Board, that moment I would be accused of trying to bring political pressure to bear'."

It seems reasonable to infer that Eccles in 1951 found himself in agreement with the Wilson theory as to the proper relation between the Reserve Board and the President. But that theory was not the one followed by Eccles throughout most of his career as Chairman of the Board during which he made many visits to the White House and in high degree laid the Federal Reserve System in the lap of the President.

From his page 494: "The pattern of recent events—referring to President Truman's call of the Federal Reserve authorities to the White House, and the fact that Secretary Snyder, rather than the Board of Governors, had the ear of the President—made it clear that the release of the letter—by the White House to the effect that the Board would support the Treasury program—was a final move in a Treasury attempt to impose its will on the Federal Reserve. If swift action was not taken to offset the effect of the move, the Federal Reserve would no longer have a voice in deciding monetary and credit policies. It would lose the independent status Congress meant it to have and, in its most important function of open-market operations, it would be reduced to the level of a Treasury bureau."

On page 496, he states, apropos the same episode, that "It is most unfortunate that this widely important matter of money and credit which Congress has placed in the Federal Reserve System has been raised in

a manner which only needlessly adds to confusion."

On page 497, Eccles contends that "We [the Federal Reserve authorities] should publicly inform the President, the Treasury, and the Congress of what we propose to do, and then do it. Otherwise the public will get the impression that we have capitulated and lack the courage to discharge our responsibilities. If Congress objects to our actions it can change the law."

Thus Eccles, when he reached the end of his career as a member of the Board of Governors and the end of his book, finally came around to the principle which many men, better grounded than was he in principles of good central banking, urged as sound in 1935 when title II of the Banking Act of 1935 was being debated before committees of the House and Senate. It required the years 1935 to 1951 for Eccles to learn the truth of what so many well-trained, experienced, and objective men tried to make clear to him and Congress in 1935. The late date at which he appears to have learned the importance of the independence of a nation's central banking system is the great tragedy revealed by the Eccles book, and it is a tragedy for which the people of this country, who could and should have had better treatment, have paid, and will continue to pay, dearly.

At the hearings before the Committee on Banking and Currency, House of Representatives, March 27, 1935, this reviewer, as a witness and as a part of his testimony, introduced in the record (pp. 770-772) a statement signed by 69 monetary economists in which they warned (p. 771), in respect to the provisions of title II of the Banking Act of 1935, that "the Federal Reserve administrative authorities, instead of being given the independence which is appropriate to the officers of a nonpolitical central commercial banking system, will be brought under the direct control of the President. ... The Board can become a politically controlled Board with little opportunity to exercise independent judgment."

"The lessons of central banking teach us that the further a central banking system is removed from political domination, the better it is for the country."

"All measures designed to correct weaknesses in the Federal Reserve System should seek to increase, rather than destroy, its independence of political influence. They should increase, not reduce, its commercial nature. They should assure, not impair, its liquidity. And they should free it from Government financing rather than link it more closely to the fiscal needs of the Government."

Many experienced and well-advised men issued similar warnings both before the House Committee and the Senate Committee on Banking and Currency which held hearings from April 19 to June 3, 1935. Those who agreed in principle with the 69 monetary economists have been proved correct as to the unsoundness of those provisions incorporated in title II of the Banking Act of 1935 which permitted and invited the impairment of the independence of the Federal Reserve System by a Reserve Board willing to permit and to foster such impairment.

But that law, unwise as some of its provisions were, did not require the Board to sacrifice its independence. What the Board did to impair its independence was done voluntarily. On this aspect of the picture, Mr. Joseph H. Frost, chairman of the Frost National Bank, San Antonio, Tex., made the following pertinent and accurate observation—he also had opposed passage of title II before the Senate committee in 1935—in an address in Washington, D. C., May 10, 1951:

"Congress has not passed legislation of any kind which would relieve the Federal Reserve Board of the responsibility of main-

taining the solvency of the currency. Therefore, the Board is still an independent entity, legally fully empowered to make its own decisions and still responsible for the preservation of the integrity of the currency.

"We should never hear a complaint from the Board to the effect that the System was coerced or compelled to buy \$24,000,000,000 worth of Government bonds to support the deficit policy of the Government. The Board itself voluntarily adopted the policy of a fixed maximum-interest rate and bought the bonds to accomplish that purpose."

"Undoubtedly there should be a close and cordial relationship between the Board and the Treasury Department, but both should recognize the impossibility of maintaining any fixed rate of interest in the market for Government bonds and at the same time protecting the soundness of the currency. It is appropriate and desirable that the Federal Reserve Board should receive suggestions and recommendations from the Treasury Department, and that they should further receive advice from such bodies as the Federal Advisory Council, the representatives from the American Bankers Association, the Council of Economic Advisers, etc., but, after having received advice and information from all available sources, the decision as to policy must be made by the Board on their own responsibility, and it should be of such a kind as will carry out the principal purpose for which central banks are responsible.

"No, the Board should not blame either the Treasury or the commercial banks for the results of their own free-will decisions, but should alter their policy to the extent necessary to achieve the classical purpose of all properly conceived central banks, which is the protection and preservation of the solvency and integrity of the people's money."

Considering that the Eccles policies impaired the proper independence of the Board of Governors and the Federal Reserve System, and weakened greatly the quality and purchasing power of the dollar, the following statement from his page 476 provides strange reading indeed. "The dollar must be defended. To do otherwise would be a great tragedy."

ECCLES EMBRACES THE UNDERCONSUMPTION THEORY OF BUSINESS RECESSIONS

Examples of the endorsement by Eccles of the underconsumption theory of the business recessions of 1929-33 and 1937-38 are the following:

Page 77. "The time came (in 1929) when there were no more poker chips to be loaned on credit. Debtors thereupon were forced to curtail their consumption in an effort to create a margin that could be applied to the reduction of outstanding debts. This naturally reduced the demand for goods of all kinds and brought on what seemed to be overproduction, but was in reality underconsumption when judged in terms of the real world instead of the money world."

Page 184. "I prepared a memorandum for the President. It addressed itself to the old question of how consumer income and expenditures could be increased to a size that would warrant the full utilization of the capital goods industries."

Page 299: "Soon thereafter (in 1937) the inflated price bubble burst for want of purchasing power to sustain it, and the slump started in earnest."

Dr James A. Estey, in his *Business Cycles* (Prentice-Hall, Inc., New York, 1950), second edition, probably states with accuracy the typical opinion held by the most careful scholars in the field of business cycles and oscillations regarding the underconsumption theory (or theories) when he says (p. 249): "The underconsumption approach . . . is the natural approach for the man in the street. It sounds plausible and wins ready

acceptance. For this reason, it has a practical importance, perhaps out of proportion to its scientific content. Not only is it the background of the more fantastic schemes for sharing wealth and of such movements as the Townsend Plan, but it furnished the momentum behind much that is most characteristic of the New Deal."

In discussing what he calls "Naive Underconsumption Theories," Estey says (p. 250): "The simplest form of the underconsumption theory is that the economic system cannot distribute enough purchasing power to enable the output of industry to be sold at a price that will cover costs (including a reasonable profit)." Although there are varieties of the underconsumption theory, it seems that, in the main, the Eccles variety is that referred to by Estey.

If Eccles should conclude that he had adequate support for his belief in the accuracy and adequacy of his underconsumption theory of business recessions because Keynes and his followers also embraced an underconsumption theory, it would be this reviewer's opinion that if Eccles would study the contentions of Keynes and the relevant facts he would find that Keynes, in his book, *The General Theory of Employment, Interest, and Money*, produced a piece of deductive reasoning rather than a series of conclusions resting upon supporting evidence. Keynes used an underconsumption theory in his explanation of the business recession of 1929-33, but he had no tenable theory of business cycles. He confused symptoms of a business recession with causal factors. What he did was to dress up a layman's underconsumption theory in a scientific jargon and attempt to pass it off as science. Factual evidence to support his basic theories appears to be lacking and, insofar as it exists, it refutes them. The highly experienced and reputable staff of the National Bureau of Economic Research, which organization has probably collected the most evidence and provided the most scholarly analyses of the evidence on, and theories of, business fluctuations, have not been able to support Keynes or the underconsumption theory of business cycles or recessions.

Said Dr Arthur F. Burns in his booklet, *Economic Research and the Keynesian Thinking of Our Times* (National Bureau of Economic Research, Inc., 1819 Broadway, New York, June 1946), page 20: "Since Keynes works with an artificially simplified business cycle, it is not surprising that his explanation collides with the facts of experience." Burns continues (p. 21): "Keynes' adventure in business cycle theory is by no means exceptional. Fanciful ideas about business cycles are widely entertained both by men of affairs and by academic economists. That is inevitable as long as the problem is attacked on a speculative level, or if statistics serve merely as a casual check on speculation. To develop a reliable picture of the business cycle of actual life it is necessary to study with fine discrimination the historical records of numerous economic activities—not merely investment, or employment, or public finances, or banking operations, but all these and many others." Work of the proper type in this field, says Burns (p. 21) "is costly and time-consuming, it means much turning back, revising, rethinking, redoing, it often leads to disappointments and taxes patience. But there is no reliable shortcut to tested knowledge. Public thinking about business cycles can be confused by hurried and ill-digested statistical inquiries, no less than by speculative excursions from the dreamland of equilibrium or from the caprices of common sense."

Had Mr. Eccles undertaken the type of analysis provided, for example, by Dr. Norman J. Silberling in his book, *The Dynamics of Business* (McGraw-Hill Book Co., Inc., New York, 1943), chapters 13 and 14, he

doubtless would have found himself dealing with a multitude of causal factors, leading to the crash of 1929, reaching far beyond the simple and generally untenable underconsumption theory which he (Eccles) has advanced. In any event Silberling did not find an underconsumption theory adequate as a basic explanation of the crash of 1929.

The underconsumption theory (or theories) has a long history. In general, it is a basic doctrine in the philosophy of Socialists and almost invariably gives rise to programs for redistribution of wealth and government dictatorship in high degree—all characteristics of the Eccles programs.

As a part of his underconsumption theory Eccles embraced the oversaving theory. Up to the crash of 1929 there was, he contends, too much thrift and not enough spending.

Page 74: "We did not as a nation consume more than we produced. Far from it. We were excessively thrifty."

Page 75: "This vast effort [construction of buildings, roads, etc., prior to 1929] was not the work of a profligate economy. It was the result of an economy that in the aggregate was, if anything, too thrifty."

Page 83: "The difficulty is that we were not sufficiently extravagant as a nation."

As one looks at the installment buying and the great volume of private debt accumulated prior to the crash of 1929 and at how these debtors suffered when a period of adverse economic conditions arrived, the lack of foundation for the Eccles notion that we were too thrifty and did not spend enough would seem to be obvious.

"Thrift and economy," says Eccles (p. 83), "means less consumption." The facts seem clearly to contradict that contention. They appear to be that no individual or nation gets into trouble through the practice of thrift and economy, that it is by thrift and economy that people grow prosperous, and that it is from debt that cannot be repaid that serious trouble arises.

Says Eccles (p. 20): "Later on, too, I was to challenge in a direct way a further belief held by my father and his friends that there would always be a shortage of capital in the land and that therefore saving was a good in itself." The answer to that is that so long as capital bears a price it is scarce, and so long as there is a positive rate of interest there is a scarcity of loanable funds. It seems safe to assume that Mr. Eccles has not yet seen a situation in this country or abroad in which capital has ceased to bear a price or a positive interest rate ceased to exist. It was his father, not he, who was correct in his contention.

Perhaps the explanation of the fact that Eccles developed or embraced theories which careful scholars over a period of many years have been unable to substantiate or have repeatedly demonstrated to be false is supplied by him in his statement (p. 82) that "Wherever possible I preached the doctrine I formulated over a period of months."

ECCLES EMBRACES THE THEORY OF A COMPENSATORY ECONOMY

On page 79, Eccles sets forth his theory as to "A policy of adequate governmental outlays at a time when private enterprise is curtailing its expenditures."

Page 252: "The Government must be the compensatory agent in this economy. It must unbalance its budget during deflation and create surpluses in periods of great business activity."

Page 257: ". . . The primary emphasis of my own thinking was on the use of the tax instrument as a major device for achieving economic balance."

Eccles does not recognize the bankruptcy of the theory of the compensatory economy as revealed in the fact that it has been chiefly a one-direction program involving profligate Government spending and waste, and deficits for all but three fiscal years since

1930. He does not explain how it happened that we had a quick, sharp recovery, 1921-23, from the deep and severe recession of 1920-21, with practices just the opposite, in practically every major respect, of those he insists were necessary for recovery in 1933 and after. He does not explain in any adequate or careful manner how we recovered from other recessions and depressions without following his prescription beyond offering the observation that in earlier instances the frontier had not disappeared. He makes no mention of the fact that we began to move toward recovery, following the low point of the index of industrial activity in July 1932—a recovery that was interrupted by the Presidential campaign and the fears for the currency and liquidity of the banks generated by Roosevelt and his currency manipulators.

He provides no analysis of the unprecedented jump in the index of industrial recovery, April to July 1933, when Roosevelt was supposedly launching an economy program as pledged during his campaign. He fails to make clear that if a program of a compensatory economy is to be carried out in accordance with the theory, as outlined by Eccles and others, it would require Executive dictatorship. He complains at various places in his book that the program was not successful for this or that reason, but he seems not to realize that the answer lies in the fact that we have not had a dictator who, of necessity, would be required to know precisely what to do and when to do it and who would have to have the power to make his will effective.

So long as we have our three major divisions in our United States Government, that Government cannot make such a program effective. Even if all branches of that Government could be united under a dictator, we would, possibly, still have the 48 States and private initiative with which to contend.

The theory of a compensatory economy is unworkable in practice, in this or in any other country. The economy of a nation, the mechanism of government, and the behavior of people are not as simple in operation as that theory implies. The compensatory economy is one of the gadgets of those who seem to think they can manage a people's affairs better than can the people themselves by pushing this button and that. It is the theory of the would-be dictator. Since such people are out of place in what is supposed to be our system of government, there is no prospect of success for the theory of a compensatory economy. Furthermore, no dictator has ever made a success of the plan.

ECCLES EMBRACES THE STAGNATION THEORY AS APPLICABLE TO THE DEPRESSION AND RECOVERY FOLLOWING 1929

From his pages 71-72: "Those who held these views (that there are self-corrective forces that raise us from our depressions) overlooked the fact that as far as the geographical frontier was concerned, it had largely ceased to exist. Its development in the first instance was based on the availability of free or very cheap land, an abundance of raw materials, and cheap immigrant labor to exploit. But none of these elements was present in the thirties. As far as the technological frontier was concerned, there was another oversight. It was not understood that developments in this field take place in a climate of high prosperity, when purchasing power of the masses increases their demands for a higher standard of living and enables them to purchase more than their bare wants. In the America of the thirties what hope was there for developments on the technological frontier when millions of our people hadn't enough purchasing power for even their barest needs?"

The stagnation theory is as old as economic depressions. Every severe depression seems to have produced its pessimists. Such

thinking has been a manifestation of the panic in the minds of men who, apparently, have not been well informed regarding the history of economic depressions and recoveries and who, consequently, have lacked perspective.

Thomas Malthus, in the early nineteenth century, produced a pessimistic theory as to the future of England just as she was entering the threshold of an era of unprecedented prosperity.

Those economists who, after the recession of 1937-38, offered testimony before the Temporary National Economic Committee (in 1939) to the effect that the United States had reached the period of "economic maturity," that the plant capacity of industry was too great for our economy, that the steel industry was overbuilt, and so on, made a sorry record for themselves and did a great disservice to their country. Whether their perspective was as bad as events have proved it to be or whether, regardless of perspective, they were bent upon doing their part to further "the revolution" in this country, seems to be a debatable question. In any event, they endeavored to show how private enterprise was responsible for the recession of 1937-38, how unwise and inept was management of private enterprise, how imperative was the need for more and extensive Government planning and management. The Eccles contentions are in general the same in nature.

Apparently no place in his book does Eccles accept the fact that the initial upswing in business activity from the low point of a depression comes, in a natural recovery, from the producer rather than from an increase in demand. He appears to take the position that production cannot revive unless and until demand increases. Therefore the Government must step in and create the demand. A careful study of statistics on business recoveries should reveal that the lead is often, perhaps generally, supplied by the producer without there being any increase in demand. Indeed, a natural recovery tends to begin while demand is still declining. It starts under these conditions because the persistent, though declining, demand finally reduces inventories to a point which invites further production to meet this persistent, though declining, demand. With inventories and costs reduced as against this prevailing demand, the producer will in due course begin to produce again. His activity creates a demand for labor, raw materials, transportation, financing, and so on.

It seemed reasonably clear that inventories and costs had been reduced sufficiently by July 1932 for producers to start producing as indeed they did. The index of industrial production, adjusted for season variation, reached its low of 58 (1923-25=100) in July 1932. In August, the index rose to 60; in September to 66; in October to 67; in November it was back to 65—the Roosevelt election and fears of his policies caused businessmen to wait to see what he would do; in December it was 66; in January 1933 it was 65; in February it was 63; in March it was 59. The unadjusted index in March 1933 was 60 as compared with 56 in July 1932.

The index, adjusted, of factory employment reached its low of 58 in July 1932 and rose to a higher level in the months following, but settled back to 57 in March 1933. Factory payrolls similarly began to rise in September 1932. Freight-car loadings, index adjusted, began to rise in September. Department store sales, index adjusted, began to rise in September. It was the producer, not the consumer, that led the way. His increased production from July to August created purchasing power that made possible an increase in department store sales in September. These are in general typical statistics of a natural recovery generated by producers, not because of an in-

crease in demand but because of a persistent, though declining, demand operating against producers whose inventories are low or exhausted and whose costs have been reduced sufficiently to promise profitable operation.

It is because economic recovery is self-generating in this manner, if not obstructed and, even more easily, if encouraged, that one sees revealed the false premises upon which the stagnation, underconsumption, and compensatory economy theories rest.

In the history of economic doctrines, the optimists, as distinguished from the pessimists such as Malthus, Eccles, various witnesses before the Temporary National Economic Committee, and others, are conventionally classified under the heading of the liberals. There should be ground for reflection in that for those pessimists who have concluded that the principles as to the importance of the freedom and independence of the individual are outmoded, impractical, and the illusions of unprogressive people, and that the State should take over.

The clock cannot be turned back to demonstrate what would have taken place had the planners stayed out of Washington and had the natural forces of recovery been permitted and encouraged to operate. But there are some outstanding facts worthy of serious consideration: The recovery of 1921-23 came quickly and effectively in the absence of the nostrums prescribed by the planners in the 1930's. It came under a program of Government economy, with the budget balanced and with debt retirement each year, with the tax burden and Government receipts reduced, with encouragement to private enterprise, without currency manipulation, and without the creation of a huge bureaucracy to manage, to ment, and to live at the expense of the producers of real wealth.

The recovery, following the recession beginning in 1929, started in July 1932 before the planners could throw their disturbing programs into gear.

The recovery of April-July 1933, under a policy of economy, was sharp.

When the planners got in power and set their plans in motion, the economy showed disturbance and stagnation in several important respects. The velocity of bank deposits, which reflects confidence, sagged steadily after 1937, remaining every year thereafter, and up to the present, below the level reached at the depth of the depression in 1932. The flow of new capital into industry as late as 1937 was still below the low level of 1931 (the lowest being in 1932). Loans of all banks in the United States continued to decline until June 1935. Unemployment is estimated to have fallen not lower than 7,700,000 (in 1937) and to have been 9,480,000 in 1939 before we entered into an armament program of World War II. (The estimate for 1940, all figures based upon the 1940 census, is 8,120,000. Statistical Abstract of the United States, U. S. Department of Commerce, 1950, p. 174.)

The positive results the planners can show are persistent deficits in the Federal budget, a huge public debt, crushing taxation, a bureaucracy wasting and eating out the substance of this Nation. The planners should also claim the sharp business recession of 1937-38, since that occurred under what, up to that time, they called their planned prosperity.

Such prosperity as we have had under the planners has rested in high degree upon scarcities fostered by the Government (killing of pigs and various restrictions on productive activity), upon destruction of wealth by war and by the giving away of real wealth resulting in an unusual scarcity of goods for civilian use (as revealed by the high prices), upon the blood of our boys, and upon a devaluated currency. No nation prospers in a real sense, or as much as otherwise would have been possible, by destroying wealth, by

making its goods artificially scarce, by giving away its wealth, by sending its young men to their death, and by depreciating its currency.

FUNDAMENTALS THAT ARE OVERLOOKED OR IGNORED

Much of the Eccles "logical radicalism" reveals that he overlooks or does not believe in the importance of various fundamental forces, principles, and concepts which have contributed so much to the progress of this Nation.

The vital importance of protecting human freedom against an oppressive State seems to be ignored in this book. There is no concern expressed over the fact that our Federal Government, which, under our Constitution, is one of delegated and restricted powers, has been converting itself into a Government of general powers. The strong tendency in the Eccles book, despite the existence of a chapter entitled, "Incentives to Self-Help," and a statement (p. 389) that he is really very much opposed to "still further intrusion of the Government into the field of private credit," is to take all important problems to Washington. It seems to be taken for granted that there is need for a governmentally managed economy and that it is an eminently desirable system for us to have.

The question of constitutional Government appears not to be a consideration in the theories, programs, and policies outlined in this book. In writing on pages 393-394, in defense of the Employment Act of 1946, Eccles says: "It would merely be a recognition of the facts (1) that the Congress has step by step authorized the assumption by the Government of numerous responsibilities affecting industry, commerce, agriculture, and labor." There is no suggestion that there is a possibility that such step-by-step encroachment by Congress might be unconstitutional or unwise.

When Sir George Paish, long a close student of business fluctuations and economic crises, visited the United States in 1937, he said: "Long experience has caused me to come to the conclusion that the economic crises of the world which come from time to time are the result rather of political action than of economic action, and can be avoided only when the statesmen of all nations have a greater understanding of economic law and have some appreciation of the consequences of their own actions. . . . It may be said that the statesmen of the world, taken as a whole, have, since the war, and especially in recent years, acted in such a manner as to bring the world machine almost to a standstill." (The New York Times, February 4, 1937.)

Mr. W. T. G. Hackett, economic adviser, Bank of Montreal, recently said in an address (published in the Commercial and Financial Chronicle of April 19, 1951): "A look at the 'terrible thirties' in the light of history will, I think, convince any fair-minded observer that the world-wide dislocations of the time were as much due to interference, by governments, with the processes of international trade as to the shortcomings of business enterprise."

"The postwar years have shown with compelling clarity that economic well-being cannot fully be underwritten by governmental action. . . . Significant is the fact that antideflationary measures are politically easy, but that anti-inflationary measures are politically difficult. Moreover, governmental medicines for low purchasing power, being usually popular and palatable, tend, like some other potions one can think of, to become habit-forming. The result has been, I suggest, that the depression-born emphasis on ever-abundant purchasing power as the touchstone of material well-being has left us some legacies of rather dubious value. We have perhaps been in

danger of forgetting, at times, that what is not produced cannot be consumed. The link between effort and reward has been weakened. And the idea that government is the residual guarantor of welfare seems to have encouraged the tendency to run to Government for protection against the ordinary as well as the extraordinary hazards of enterprise.

"* * * There are a few perhaps more sharply defined lessons which may be drawn from wartime and postwar experience. One is that it is very difficult to achieve stability by fixing the symbols of stability. Another is that it is just as difficult for human beings in government as it is for their fellow creatures elsewhere, to formulate long-range plans for a future in which the apparently inevitable has an awkward habit of not happening and in which the unexpected frequently does."

He concludes: "What I . . . suggest is, first, that governmental action is subject to definite limitations, political and psychological as well as economic, and, secondly, that for many years to come we shall have little need of the philosophies and practices of the dismal triad."

Said Dr. Hjalmar Schacht, in his *Gold for Europe* (Gerald Duckworth & Co., Ltd., London, 1950, p. 3): "As a result (of 'the disastrous attempts to direct economy by legal and administrative interference with the currency structure,' p. 2), all international trade is involved today in a permanent crisis which keeps all politicians and economists fighting for breath. Anyone who lived through those happy days before the First World War—when the international exchange of goods took place without friction under the free play of private enterprise, and when the state confined itself to a few general regulations—sees today with horror how governments labor in vain to restore international trade by a succession of regulations and interference. This continual government interference simply results in the dampening down of all enterprise on the part of those engaged in trade. The efforts of businessmen, formerly concentrated solely on the organization of production and markets, are exhausted today largely in a struggle against state bureaucracies, who have to carry out the instructions of politicians."

That such opinions, expressed by these keen and experienced observers, might be correct is not recognized as a possibility by Eccles. His cure for what these men regard as too much interference and mismanagement by Government is more interference and more management by Government.

The Eccles book does not reveal a realization on his part that there is a vast difference between a correct analysis of how the greatest good for the greatest number is obtained and the development of a Robin Hood attitude and program.

Although he reveals that he was aware that there was a widespread fear that he was helping to socialize or communize this Nation (p. 232), he denied that there was any valid basis for that fear. Nevertheless, his program provided real justification for it. When a central banking system becomes a tool of the Executive and is used for the advancement of its political program, when the people lose control of the public purse by having an irredeemable currency thrust upon them; when the planners and Government managers take over to the extent that has come to pass in this country, the Nation is not only on the road to, but is already deeply involved in, socialism.

The Eccles book reveals him to be a leader among those who have hacked away at the foundations of our republican form of government—among those who have regarded themselves as leading a revolution against both our economic and political system. "The depression," said Eccles, Oc-

tober 27, 1933 (pp. 129-130), "represented the end-phase of an organization, both economic and political, which has existed about 150 years the world over."

The book reveals that Eccles had become frightened and had lost faith in the alleged virtues of private enterprise, free markets, a fixed monetary standard, and a redeemable currency. He states (p. 84) that the president of a western railroad had said of him: "Poor Eccles, he must have had so terrible a time with his banks that he is losing his mind." And that another associate had remarked: "All of us know you are overwrought by the general economic situation." But those remarks were recorded in the book not because Eccles supposed there could be any accuracy in them, but as examples of his belief that their authors lacked vision and were thoroughly wrong in not being as excited and as ready as he to become "logical radicals." The teachings of the past as to the virtues of freedom for the individual, for private enterprise, and for markets, with the Government acting as an umpire rather than as a manager, producer, and distributor, were no longer valid in the opinion of Eccles, and should be discarded. The Government, he in effect contended, needed to become the people's boss—to apportion the people's income between investment and expenditures, to distribute purchasing power (p. 130), to juggle the Federal budget, currency, and taxes to accomplish the purposes deemed desirable by the Government planners and managers.

The book seems to show no concern on the part of Eccles regarding the dangers in a huge bureaucracy which feeds upon the people and wastes their substance. There is no fear, apparently, that the tax and debt load can become so heavy as to be destructive.

While Eccles stresses the desirability of maintaining full employment, he does not deal with the question as to how that aim can be fulfilled and how at the same time the purchasing power of the currency can be preserved. Said W. T. G. Hackett, cited above, on this point: "The theories of planned stability, while offering us a formula for full employment, have yet to come up, in practice, with a recipe for full employment plus a dependable dollar." He remarked further: "Thus I leave with you . . . the great unsolved problem of full-employment economics. How can we maintain full employment and at the same time evolve wage policies which by their tie-in with productivity will help to maintain the value of the wage earner's dollar?" Eccles shows himself to be unaware of the fundamental issue pointed out by Mr. Hackett.

Similarly, while Eccles insists (p. 400) that "the basic long-range problem . . . is to avoid deflation by providing a flow of necessary purchasing power to those who would use it to increase their standard of living," he does not face the problem of how deflation is to be avoided, once a boom develops, without embarking upon a policy of progressive depreciation of our currency. He has nothing more fundamental to suggest than Government controls, such as tax policies to reduce "idle savings" and to "induce more spending," and the employment of wartime controls.

There appears to be no recognition of the fact, or of the significance of it, that the deep depression of the 1930's was practically world-wide and that it engulfed the many countries involved regardless of their form of government or of the extent to which the various governments regulated or participated in activities in which private enterprise would operate if free to do so.

At no place in the book is concern expressed over the extent to which government management of our people and economy has engulfed the supposedly relatively free people of this Nation. The significance of that apparent lack of concern over this trend of

events is high lighted by the following statement made by Earl Browder in his booklet, *Keynes, Foster and Marx, Part I, State Capitalism and Progress* (Published by Earl Browder, 7 Highland Place, Yonkers, N. Y., 1950), pages 29-30: "State capitalism leaped forward to a new high point in America in the decade 1939-49. It became overwhelmingly predominant in every major phase of economic life, and changed the face of politics."

"After the war, with the lifting of some forms of state control, there was a certain slowing up of the tempo of this development, but not a change in direction. State capitalism, in substance, if not in formal aspects, has progressed further in America than in Great Britain under the Labor Government, despite its nationalization of certain industries, which is a formal stage not yet reached in America; the actual, substantial concentration of the guiding reins of national economy in governmental hands is probably on a higher level in the United States of America."

SOME NOTABLE OMISSIONS FROM THE BOOK

Although Eccles condemned the easy-money, low-interest-rate policy of the Treasury during and after involvement in World War II (pp. 143, 483), he did not point how he, too, had contributed to the situation for which he condemned the Treasury. Said he (p. 143): "... The Treasury Department seemed unable to recognize that 1940-45 was not 1934, that a policy that was correct in the period from 1934 until 1940 was a source of lasting mischief in the war years and beyond them." As an example, not mentioned, of his contributions to the source of lasting mischief, the Reserve Board, in December 1942, in cooperation with the United States Treasury, engaged, by a manipulative transaction, in an illegal issuance of \$660,000,000 of Federal Reserve bank notes as fiat Treasury currency, which money had the power to support, at the reserve ratios then prevailing, approximately \$9,900,000,000 of additional deposits in our banking system.

Eccles does not discuss the fact that he repeatedly and persistently fought to open up the Federal Reserve banks as a dumping ground for United States securities by seeking an amendment to the Federal Reserve Act authorizing direct purchases by the Federal Reserve banks in unlimited amounts from the Treasury—one of the worst practices known in central banking. It was only after a hard fight that Senator Tamm and his associates were able, in March 1942, to place a limit of \$5,000,000,000 on such direct purchases (section 14 (b) of the Federal Reserve Act). Eccles mentions the fact (p. 123) that he recommended such direct purchases in 1933, but his subsequent campaign for that procedure is not mentioned thereafter. Each time the question of renewing the direct-purchase provision arose in Congress—in 1944, 1945, 1946, 1947, and 1950—some representative of the Reserve Board, usually Eccles, battled to make permanent the authority of the Reserve banks to purchase Government securities directly from the Treasury—a notoriously unsound practice in central banking. In 1950, the temporary \$5,000,000,000 direct-purchase provision of the Federal Reserve Act was again extended by Congress (to July 1, 1952) under pressure by the Reserve Board.

The following is from the testimony of Chairman Eccles (mimeograph copy) before the House Committee on Banking and Currency, March 3, 1947, illustrating his effort to persuade Congress to make permanent the temporary \$5,000,000,000 direct-purchase provision:

"Nothing constructive would be accomplished by the proviso that the Reserve system must purchase Government securities exclusively in the open market. . . .

"What is involved in the proposed bill is not a question of monetary theory or policy,

but simply a question of efficient, economical, and businesslike management of the public debt.

"One suggestion which has been put forth is that the authority should not be a part of the Government financing machinery. . . . It is better not to place an arbitrary limit of, say, 2 or 8 years on the authority. . . ."

There is no discussion of the evils of an irredeemable currency or of the virtues of a redeemable money. At no place does he mention the fact that in 1933 he advocated a fiat money. This should have appeared on pages 108-107 of his book to conform with his actual testimony (hearings, pp. 720-723). He praises Congressman Goldsborough for his intellectual leadership in the House Committee on Banking and Currency (p. 200) and for his "breadth of vision" (p. 235), but he does not inform the reader that Goldsborough had introduced a fiat money bill in January 1933 and was, in fact, one of the most extreme of the "wild money" men then in Congress. While praising Goldsborough, whose monetary proposals it would be difficult to match for wildness and demagogery, Eccles was very critical of Chairman Steagall (p. 181), of the House Banking and Currency Committee, who, with Senator Glass, endeavored to fight off the programs of the fiat currency men and those who, through title II of the Banking Act of 1935, proposed to make the Federal Reserve System an instrumentality of a governmentally managed economy.

At no place in his book does Eccles condemn the issuance of Federal Reserve notes against Government securities. Indeed, he regards such procedure as both necessary and desirable despite the lessons to the contrary provided by the history of money and of the practices of good central banking.

He does not indicate that, as the Chairman of this Nation's central banking system, he was willing to state, at the close of an address by this reviewer on Surrender to Inflation, and as a prelude to his own address on the same subject before a meeting of the National Industrial Conference Board in New York City, September 23, 1948, that the gold standard in this country did not stop the deflation following the crash of 1929. He could have stated with as much validity and wisdom, that good rails on a railroad did not prevent a certain wreck, on those rails, for which they were in no sense responsible. Nowhere in his book does he point out, in a similar manner, that our system of irredeemable currency did not prevent the great decline in the purchasing power of our dollar, particularly since 1929, or the sharp business recession of 1937-1938, a recession that was sharper for the 12 months it ran than that experienced during any 12 months of the recession of 1929-32. He does not point out that the longest recession and depression on record in this country occurred under an irredeemable currency, 1873-78. It lasted 65 months as compared with the 43 months of 1929-1933.

The book does not indicate how Eccles and the Board of Governors, in direct violation of the clear wording and history of section 7 of the Federal Reserve Act, which prescribes the method to be used in dividing the earnings of the Reserve banks, began, in 1947, to turn over to the United States Treasury a large percentage of the earnings of those banks. This illegal practice was defended by Eccles on the ground that section 16 of the act, which authorizes a tax on Federal Reserve notes, permitted his procedure. His distribution of these earnings is not a tax on Federal Reserve notes under section 16—it is merely, and incorrectly, alleged to be such. A reasonable and accurate interpretation of the meaning of section 16, such as that given by the Board's own counsel on October 15, 1915, would make clear the absurdity of the Eccles contention that section 16 could be used to override sec-

tion 7. This episode is mentioned because it is a fair sample of the high-handed methods sometimes used by the Reserve Board, under the Chairmanship of Eccles, to accomplish its desires regardless of the law. It is symptomatic of the philosophy of and urge toward dictatorship revealed in the Eccles book.

ECCLES ON DEVALUATION OF THE DOLLAR

From page 124: "In my testimony before the Senate Finance Committee [February 1933], I had argued that there was no need to devalue the dollar in terms of gold, or increase the price of gold in order to raise commodity prices. Devaluation by itself would not bring about any increases in prices. Prices could be raised only if the Government created effective purchasing power by a spending-lending program based on deficit financing."

From pages 137-138: "I had met Warren [of Cornell University] before in Ogden. I've already said I was unimpressed by his plan to increase prices by increasing the price of gold. Warren was no doubt an able agricultural economist, but he had much to learn about the way the money and credit system operated. . . . I was surprised to find that Rogers [of Yale University] was as much opposed as I was to Warren's plan. He believed, as did I, that the only way commodity prices could be raised was by increasing the means of payment in the hands of those who were willing to spend their money. What was needed was an increase in both the volume of money and its turn-over."

"My new-found ally [Rogers] and I argued the case against Warren in a 3-hour meeting. We did not change his view in the least. He had already sold his plan to Roosevelt as a result of Morgenthau's support. Roosevelt, in turn, was to secure its ratification by Congress." This seems to refer to events in January 1934.

From a publication entitled "Five Next Steps in the Program of the Committee for the Nation to Rebuild Prices and Purchasing Power" (Committee for the Nation, 205 East Forty-second Street, New York City, released for publication April 6, 1933), page 1: "From the standpoint of farm and business relief, it is of the utmost importance that the United States shall increase the price paid by the Treasury for gold to correspond with the increased purchasing power of gold. Setting this higher value will increase the price of commodities."

On page 3 of that publication, item 3 of that committee's recommendations reads: ". . . Discontinue the efforts to keep the dollar at its former gold parity."

Item 4, page 3, reads: "It should be announced forthwith that prior to lifting the embargo on gold at a future date, it will be the policy of the United States to revalue gold. It is the opinion of the committee that in the revaluation, the United States Treasury should raise the price of gold from \$20.67 per ounce to a new price of \$36.17 per ounce. This is an increase of 75 percent—an arbitrary temporary level, estimated to bring the commodity price level to a 1926 base."

Item 5, page 4: "With a revaluation of gold, the income of agriculture will be restored so that it can again buy from industry."

One of the signers of that statement, listed on page 6, was "M. S. Eccles, First Security Corp., Ogden, Utah."

That publication states, page 5, that "The undersigned are the first 100 to subscribe to the Committee for the Nation's program as outlined in the 'Five Next Steps' and to authorize the use of their names as endorser."

The Eccles book does not mention the Committee for the Nation, either in the index or otherwise.

Eccles writes of the effects of devaluation as follows, page 124: "What dollar devaluation succeeded in doing was to attract the gold of the world to American shores, in exchange for which foreigners received more

dollars. A substantial increase in our exports resulted as the new supply of dollars was spent on the purchase of American goods. But ultimately the policy brought us more than three-fourths of the gold of the world, for which we had no use."

Although Eccles refers to the increase in exports, he does not mention imports. The facts, according to official reports, are these: Following the devaluation, January 31, 1934, and calculating to the peak of the increase in exports and imports before both were carried downward in the business recession of 1937-1938, merchandise exports increased from \$183,000,000 in February, 1934, to a high of \$333,000,000 in October, 1937, an increase of 104 percent. Merchandise imports increased from \$133,000,000 in February, 1934, to a high of \$307,000,000 in March, 1937, an increase of 131 percent.

The Eccles statement that we had no use for the gold we received after devaluation means that paper money and deposits without gold security are as good as those backed by gold. His statement puts him in the outright fiat money school. It means—if he understood the implications of his statement—that we could meet adverse balances of foreign payments as well with fiat paper money as with gold. The facts are all to the contrary. Gold is our most universally marketable commodity. Its usefulness is beyond effective questioning.

LACK OF PRECISION IN THE WRITING

Eccles states (p. 84), that a banker had said he "talks loose." Following are some samples of the loose or unprecise statements to be found in his book:

Page 74: "Those who in the thirties suggested that this was so were the very same men who in the twenties announced on all sides that there could never be another depression."

Page 75: "In the twenties we replaced by a large margin every physical loss we had suffered in the war."

Page 81: "The only way we could get out of the depression was through Government action in placing purchasing power in the hands of the people who were in need of it."

Pages 101-102: "The business leaders who appeared before the Finance Committee were quite prepared to see the [Federal] debt grow when it meant the preservation of their own interests. * * * But they were against the use of Government credit for the relief of the distressed and the employed. * * * [They] argued that the only way to relieve the pressures on the unemployed was by means of the 'trickle down' method."

Page 104: "When it came my turn to be called before the Finance Committee, I challenged all that had been said up to that point."

Page 108: "I pointed out that during 4 years of depression everyone, in an effort to protect himself, did what proved to be the wrong thing for the economy as a whole."

Page 259: "Yet the total effect of what they did ran counter to the best interests of everyone, including themselves."

Page 405: "As in all other areas, nothing was done in this one to curb the inflationary forces that were at work."

Page 465: "Such a settlement would have brought about a condition of peace in the world."

SUBJECTIVE STANDARDS OF APPRAISAL AND LACK OF PRECISE AND VALID DEFINITION

A characteristic of the dictator is that his standards of approval are subjective—they are in accordance with his desires and his ability to enforce them. Objective standards are those that apply to all, as, for example, prices in a free market in which the will of the individual is of imperceptible importance. The objective standard is that of the scientist.

The subjective standard is a strong element in the Eccles book. Closely related is

the frequent lack of scientific definition—that is, a definition that any scientist could understand and find valid and useful.

On page 133, he writes of his "gospel of logical radicalism" but does not define the term.

He writes (p. 212) of "business stability" as a desirable objective, but does not define the term in any precise or useful way. "Stability" is an illusive term, as F. E. Desauter has made clear in his important and scholarly book on Stability (the Macmillan Co., New York, 1949).

On page 258, Eccles writes: "High surtaxes on private incomes had the social objective of checking the creation of great fortunes." The meaning of social objective is not defined.

On page 263, he writes of wealthy stockholders evading their fair share of taxation without specifying what the standard of fairness is. He does not indicate whether a proportional or progressive tax provides an objective standard of fairness, but he appears to accept the progressive rate as proper without indicating how high the rate could go before it becomes unfair. Nor does he indicate who is to determine, and on what basis of justice, what the proper degree of progression would be to be fair.

On page 372, he writes of the equality of sacrifice implicit in a certain tax program, but he does not define equality of sacrifice or demonstrate how such a concept, after precise definition, could be applied.

On page 382, he writes of a stable economy but does not define the term. He perhaps comes closest to a definition of what he means by a stabilized economy, on page 394, when he writes of the Government helping to sustain and stabilize it (the economy) at a high expanding level of prosperity. But sustain and stabilize and high, as used in that sentence, are all vague concepts.

On page 393, he writes of using fiscal and monetary measures "for the purpose of maintaining economic stability through maximum production and employment." No one can know what "maximum production and employment" mean and it seems reasonable to suppose that unusually heavy production and employment, as in time of war, could hardly mean "economic stability" in any useful or desirable sense.

Also on page 393, he writes that "the Federal Government has a large measure of responsibility for maintaining a satisfactory level of business activity and employment." Satisfactory to whom? And where in the Constitution is such responsibility specified?

On pages 466-67, he writes: "The purchasing power of the dollar can be defended only when the amount of money available to those who would spend it, including the Government, does not exceed the supply of goods and services available." How does one count the supply of goods and services against the supply of money? How does one count automobiles, airplanes, a railway train, a war tank, a trip to a distant land, a visit to the theater, and so on, against the supply of money? And what would one have if he could do that? Furthermore, the money supply has various rates of turn-over. Prices are affected not alone by the supply of money but also by the rapidity of the turn-over of the dollars. Still further, prices are determined through time, not by the supply of money in existence at any particular time. Goods exchanged today may have been priced months ago. Goods being produced today may have been priced in the past or they may be priced in the future. Probably few goods that are exchanged today are priced today. Goods and services are like a stream flowing against a counterstream of money and credit which has a varying velocity; and prices, sampled today, were made largely in the past and only in part today.

EMOTIONS VERSUS INTELLECT AND PRINCIPLES VERSUS PERSONALITIES

The Eccles book is replete with expressions denoting emotion whereas the method of science calls for the use of the intellect. When mind replaces emotion, the writer uses such expressions as "it appears," "it seems," "the evidence seems to show," "it is my opinion"—words implying judgment based upon evidence. Running heavily throughout the book are such expressions as "I feel," "I felt." While in some cases it is clear that he uses the expression "I feel" as synonymous with "I believe"—which it is not—in many instances the expression "I feel" accurately reflects an emotional, rather than an intellectual, basis for the observation made.

Personalities occupy an important place in the book. Whereas the scientist endeavors to deal with issues in an impersonal manner, much of the writing in this book is in the area of personalities. The fact that the index is built on persons rather than on issues suggests the importance of persons as compared with issues in the mind of Mr. Eccles.

Those persons sympathetic with his programs or who aided him are praised, those that disagreed with him are described or characterized in caustic terms. The following are samples:

"As one listened to what they [characterized as spokesmen for creditors] and the business leaders said, it seemed that a moth flying out of one mouth flew into a second one and nourished it" (p. 93).

"Thomas Jefferson Coolidge [Under Secretary of the Treasury], a Boston banker, whose economic concepts, I was to discover, belonged to the previous era" (p. 137).

"Relations with encrusted old-timers in the Reserve System were complicated by an undercurrent of uncertainty as to what the Senate ultimately would do [about the appointment of Eccles as Chairman of the Board of Governors]" (p. 187).

"You can tell your banker friends to go to hell" (p. 199).

"Spahr gained the signatures of some 66 well-known professors in various universities, all of whom endorsed the statement of opposition he presented in person at this time. I do not know who subsidized the committee then or during its later career as a common scold. * * * Ironically Professor Spahr was a latter-day successor at New York University to Prof. Joseph French Johnson, whom Glass frequently assailed in 1913 for opposing the Reserve Act of that year" (p. 200).

"Warburg [James P.] was wedged in at this moment to speak his lines" (p. 206).

"All [witnesses opposing title II of the Banking Act of 1935] spoke in the same fuzzy way that hinted at dark and sinister things" (p. 209).

"I do not believe it was a mere coincidence that he [Senator Glass] was engaged in gathering in numerous honorary degrees from leading universities, some of whose trustees had a keen interest in seeing title II defeated" (p. 217).

"This is one case where the public result of Morgenthau's fragile feelings was highly beneficial" (p. 222).

"This change had its origins in Senator Glass' skimpy knowledge of what the procedure entailed in practical terms" (p. 226).

"When Roosevelt gave one of these pens to Senator Glass [as the Banking Act of 1935 was signed], someone present commented in a stage whisper 'He should have given him an eraser instead'" (p. 229).

"I knew he [Glass] would pose as the man who saved the bankers of America from being communized by the New Deal, and that he would also pose as the man who, in his capacity as chairman of the Senate Appropriations Committee, labored to save America by his fight against the work relief bill" (p. 232).

"Many times during the fight I asked myself what position Glass would have taken on the proposed changes in the Reserve System if someone he liked had advocated them" (pp. 234-235).

"When the first act was over and the unctuous voice of Milton Cross announced" (p. 243).

On pages 313-316, Eccles records part of a letter he had written to Senator BRAD. Instead of printing the pertinent parts of BRAD's reply to enable the reader to judge for himself the merits of the Senator's reply, Eccles writes (pp 316-317): "On January 16, 1939, with the Christmas moratorium ended, the Senator returned to the attack. The pellets in the buckshot spray he issued on that day were drawn from Poor Richard's Almanac, Bartlett's Quotations, Will Rogers' aphorisms, condensed versions of the lives of Thomas Jefferson and Andrew Jackson, and the history of the Federalist Party, and of the English people in modern times.

"Though I was somewhat baffled by the character of this reply, it was not unexpected."

From page 370 "Morgenthau * * * was, I believe, somewhat piqued that as Secretary of the Treasury he was not made head of the committee.

"If you abide by their [the bankers'] counsels or wait for their leadership, you will never do anything in time to safeguard and protect private banking and meet the changing needs of the economy in such a way as to avoid still further intrusion of the Government into the field of private credit, to which I am really very much opposed—an intrusion which the public has demanded in the past because private banking leadership has failed" (p 389).

"Some Republicans hoped I would serve their cause out of sheer pique because I had not been reappointed chairman of the Board of Governors" (p 458).

Mr Eccles performed some services in Washington and has proposed some measures not yet made effective which this reviewer would support provided they rested on the foundation of constitutional Government, a careful protection of the freedom of the individual and of private property against the encroachment of the Federal Government, free markets, the practice of economy by the Federal Government, a fixed monetary standard and a redeemable currency, the maintenance of the independence of the Federal Reserve System, verified economic principles as to how to bring the greatest good to the greatest number of people. Unfortunately, the Eccles book does not provide that sort of foundation. Instead, it employs the subjective standards of the dictator and urges a program characteristic of a highly developed governmentally-managed economy. This is, clearly, what he means by his "logical radicalism."

They Were Not There, They Mean

EXTENSION OF REMARKS

OF

HON. EDWIN ARTHUR HALL

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 13, 1951

Mr. EDWIN ARTHUR HALL. Mr. Speaker, the stooge of a Binghamton editorial writer was the author the other day of a poison-pen letter designed to infer that your Congressman talked big at home but took no action to save the penny postcard in last week's House debate.

Actually, your Congressman presented a preferential motion to strike out the enacting clause of the whole works which would have killed doubling the penny postcard if the House had wanted to

This newspaper has blacked out in blind fury every decent reference to your Congressman for a long time. Complimentary references my way are blue-pencilled at the source when some greenhorn infrequently has the naïveté to report the truth for publication. Sabotage on the home front could not be more effective coming from admitted subversives.

The fact is, I made a lengthy speech against raising all postage rates. This newspaper long ago fired their Washington correspondent, so they could not by any stretch of the imagination have been on the scene of action.

They just took their usual dirty crack at me and threw accuracy out the window. No wonder we are in deadly peril of communism right here at home when you have the spectacle of those who pose as Americans refusing to give standing room to elected representatives of American voters.

Westchester-Rockland District

EXTENSION OF REMARKS

OF

HON. RALPH A. GAMBLE

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. GAMBLE. Mr. Speaker, under unanimous consent of the House, I include the attached article entitled "Westchester-Rockland District," New York State Business Facts, published by the State of New York Department of Commerce, inserted in the Appendix of the RECORD:

[From the New York State Business Facts]

STATE OF NEW YORK,
DEPARTMENT OF COMMERCE.

Businessmen have frequent need for basic information about a community, a county or an area to aid them in their problems of operating, planning, and marketing. In 1945, the New York State Department of Commerce, recognizing this need, prepared the New York Means Business series of data books, one for each of the 11 economic areas of the State.

The sustained demand for these data books, of which over 150,000 copies were distributed, plus the availability of more recent census and other statistics, necessitates the issuance of a new series. The current New York State Business Facts series, of which this is a part, has been prepared to meet this need. Information has been drawn from the 1947 Census of Manufactures, the 1948 Census of Business, and the 1950 Census of Population. Many other sources of information not readily accessible to the businessman have also been utilized.

The New York State Business Facts series might be regarded as an all-purpose information kit. It is designed to provide, in minimum space, the maximum useful material on population, wealth, income, business activity, and facilities for each area as a whole, as well as for its principal communities. This booklet, therefore, offers a con-

venient springboard from which a business inquiry may be launched. The ultimate answer to a specific problem will frequently depend upon more detailed and specialized information than a publication of this type can possibly provide. For example, the businessman who is selecting a location in which to open a new establishment should get first-hand information through local contacts about the prospective localities and obtain additional statistics bearing on his special field of interest.

A short descriptive statement provides a bird's-eye view of the area's residents, where they work, what they produce, and what they buy. A study of the tables which follow will give the prospective resident of the area an indication of the living conditions in the various communities. The facts presented with respect to population growth, sales per store, and relative prosperity of the community will help a retailer or seller of services to select a location with the best prospects. In the statistics relating to the labor force, the manufacturer will find data of significance in selecting an industrial location. The sales manager may gauge his market potential from the statistics of population, payrolls, retail sales, and farming.

The New York State Department of Commerce stands ready to aid the businessman in his search for information. We welcome your inquiries.

HAROLD KELLER,
Commissioner of Commerce.

WESTCHESTER-ROCKLAND DISTRICT

The Westchester-Rockland district, while it is closely linked with the economy of New York City, has an important economic life of its own. Westchester County's 435 square miles of rolling hills, fine beaches, landscaped highways, country estates, and model residential villages gives this wealthy suburb its unique character. It is, however, far from being exclusively rural or residential. More than half of its 623,000 inhabitants reside in four large cities: Yonkers, Mount Vernon, New Rochelle, and White Plains, all in the southern portion of the county. Among its 927 manufacturing plants are some of the principal establishments in the metropolitan New York area, producing nationally known brands of rugs, automobiles, copper wire, elevators, and hearing aids.

Rockland County, on the west shore of the Hudson River, has, in the main, retained its suburban character, although it has developed a number of industries. About one-sixth of its 178 square miles consists of State parks which bring a substantial volume of resort trade to the area because of their proximity to New York City. The 89,000 inhabitants of Rockland all live in rural areas or in villages with populations of less than 6,000. These communities manufacture a variety of products including pharmaceuticals, cosmetics, paper cartons, and sewing machines. A number of firms also engage in textile dyeing and finishing.

Situated at the narrow southern extremity of the State, the Westchester-Rockland district is the funnel for major rail, highway, and water routes to New York City. The main line and two branches of the New York Central Railroad and the main line of the New York, New Haven & Hartford Railroad operate in Westchester County. Rockland County is served by the Erie Railroad and the West Shore division of the New York Central Railroad. These rail lines, and nine intercity bus companies not only link the area with upstate New York, the New England States, and the West, but also provide commuter service during rush hours for those who work in New York City.

Westchester County's 1,194 miles of improved highway include some of the finest parkways in the country, such as the Bronx River Parkway, Taconic State Parkway, Hutchinson River Parkway, and Saw Mill River Parkway. Rockland County has 426

miles of improved highway. With the Hudson River bisecting the area, there is ready access to the State's inland waterways and to the port of New York. Scheduled airline service to New York City and upstate New York is available at the Westchester County airport.

The availability of both space and labor force in the Westchester-Rockland District and the stimulus of war production during World War II have resulted in rapid industrial growth in the past decade, particularly in Westchester County. Factory employment in the area expanded by 68 percent from 1939 to 1947 as compared with a 46 percent gain in New York City. The area's increase in number of establishments was even more striking, almost doubling in the 8-year period.

Westchester County ranks seventh among the counties of the State in manufacturing employment. Yonkers, its largest city, is the eighth most important industrial center in New York State. The area's largest industry, like that of New York City, is the needle trades, employing about one out of every six factory workers. There is a wide diversity of manufactures in both durable and nondurable goods fields. The production of textile-mill products, primarily carpets and rugs, ranks a close second to apparel in employment. In Yonkers is the world's largest carpet factory, which is also the leading plant in the county and employs over 6,000 workers.

The machinery industry is the third largest manufacturing activity in Westchester County. Yonkers is the site of a nationally known manufacturer of elevators and escalators. Several major establishments producing copper wire, cable, and electrical equipment are located in Mount Vernon, Hastings on Hudson, and Yonkers. Tarrytown's auto assembly plants employ thousands of workers. Elmsford is the home of a major producer of hearing aids and Port Chester of nuts and bolts. Yeast and alcohol, pharmaceuticals and dyestuffs are products of firms in Tuckahoe, Peekskill, and Hastings on Hudson, and coils for television sets are manufactured in New Rochelle. One of the leading magazine publishers in the East is situated in Pleasantville.

The manufacture of chemicals and allied products is the outstanding industry of Rockland County, employing about a third of its factory workers. The leading employer in the county, located at Pearl River, produces penicillin and other biologicals. Cosmetics are produced in Suffern, and formaldehydes and insecticides at West Haverstraw. The apparel industry, the second largest manufacturing activity, is made up of numerous small shops in Suffern, Haverstraw, Nyack, and Pearl River. Several concerns engaged in dyeing and finishing silk and other fabrics for New York City's huge dress industry are located in Garnerville. Sewing machines are manufactured in Nyack. A large plant at Pearl River makes printers' and bookbinders' machinery.

The area's 712,000 persons represent one of the wealthiest consumer groups in the country, due primarily to the relatively large proportion of high-salaried executives, managers, and technical workers living in Westchester. This high level of income is only partially reflected by retail sales per capita because of the nearness of the huge and concentrated shopping facilities in New York City. In 1948, retail sales per capita in Westchester County averaged \$1,053 as compared with \$1,952 for Manhattan and \$981 for the upstate region. In recent years, a trend favorable to local shopping has developed in Westchester County with the opening of suburban branches by a number of famous New York City department and specialty stores. The competition of New York City's stores is more evident in Rockland County's per capita sales of \$747.

The 9,493 retail establishments in the Westchester-Rockland district grossed \$707,004,000 in 1948 with Westchester County alone accounting for 88 percent of the establishments and 91 percent of the sales.

Yonkers, the largest city in the area, is also the outstanding trading center, accounting for 19 percent of the retail sales and 25 percent of the wholesale receipts in Westchester County. The other leading trading centers in Westchester are White Plains, Mount Vernon, and New Rochelle. Rockland County's shopping centers include Nyack, Haverstraw, and Spring Valley.

Agricultural activity is relatively unimportant in the Westchester-Rockland district. Most of Westchester's farm lands are located in the more sparsely populated northern section. The richest farm lands in Rockland are in the central and southeastern parts of the county. The 1,129 farms in the district sold about \$5,000,000 worth of products in 1945. Westchester County's major farm products are horticultural. Its nurseries and hothouses supplied the metropolitan New York market with \$1,212,000 worth of flowers and shrubs in 1945.

The area caters to almost every type of recreation interest. Rockland County's Harriman and Bear Mountain State Parks, only 45 miles from New York City, attract thousands of visitors the year round and offer facilities for swimming, boating, picnicking, horseback riding, roller skating, camping and skiing. Scores of fine parks are scattered throughout Westchester County. In addition to the four public golf courses, there are no less than 60 private golf clubs in Westchester. There are many boat and yacht clubs along the sound and on the Hudson River as well as beaches for both fresh- and salt-water bathing.

Ten institutions of higher learning are located in Westchester and one in Rockland. Degrees in liberal arts are offered to women at the Sarah Lawrence College in Bronxville, the College of New Rochelle, Good Counsel College in White Plains, and the Marymount College at Tarrytown. For men, New Rochelle's Iona College, the Maryknoll Seminary, and the St. Joseph's Seminary and College at Yonkers offer liberal arts degrees. The University of the State of New York provides a 2-year technical course at its Institute of Applied Arts and Sciences in White Plains. Briarcliff Junior College at Briarcliff Manor, and Concordia Collegiate Institute at Bronxville offer 2 years of study at the college level. In Rockland County, the Missionary Training Institute at Nyack gives courses leading to a degree in music.

The St. Lawrence Project

EXTENSION OF REMARKS

OF

HON. JOHN A. BLATNIK

OF MINNESOTA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. BLATNIK. Mr. Speaker, under leave to extend my remarks in the Appendix of the RECORD, I include an excellent article entitled "New Life for Midwest in St. Lawrence Seaway," by Mr. H. C. Brockel, which appeared in the August edition of the magazine Government Service. Mr. Brockel is the director of the Milwaukee Port Authority, with whom I have had the pleasure of working on such legislation as the St. Lawrence project, the Great Lakes shipping law enacted last year, and other matters of major importance to the Great Lakes

region. He is an exceptionally able and conscientious public official devoted to the general welfare, and it is a pleasure to include his article in the RECORD. It follows:

NEW LIFE FOR MIDWEST IN ST. LAWRENCE SEAWAY

(By H. C. Brockel)

For the last three decades, America's most distinguished statesmen, diplomats, engineers, and business leaders have emphatically answered "Yes" to the question: Should the St. Lawrence seaway be built? Though legislation authorizing completion of the project has again apparently died in Congress, proponents are confident that the seaway will be built eventually.

President Truman, following in the tradition of every President since Taft, recommended the project urgently to Congress. Twenty distinguished Senators of both major political parties introduced legislation to authorize execution of our agreement with Canada for the seaway development.

The State Department has given the seaway high place in its international program to demonstrate to the world that nations living side by side can peacefully develop projects whose benefits transcend international boundary lines and to prove that America is sincerely determined to strengthen international relationships and achieve permanent peace, by peaceful commerce between nations.

The seaway has two great economic justifications—low-cost water transportation and low-cost hydroelectric power. The St. Lawrence is the greatest undeveloped source of hydroelectric power in North America. Two million two hundred thousand horsepower of electrical energy are running unused into the Atlantic because of our failure to harness this tremendous resource. President Truman has emphasized that our whole economic and military future requires further development of our power resources, including the vast potential energy of the St. Lawrence.

The States bordering the Great Lakes want the seaway as a transportation resource. By extending deep-draft ocean shipping into lake ports, Midwest farms and industries will be able to use cheap water transportation on a scale hitherto impossible. Industry in the Great Lakes Basin could import raw materials in large quantities, at minimum cost, by substituting a direct-water haul for a costly rail haul. Midwest agriculture and industry alike will be able to tap new markets abroad.

There is nothing new or experimental in the seaway project. For more than a century, Great Lakes ports have been engaged in direct trade with Europe through the St. Lawrence River. Between 1920 and 1940, a substantial shipping trade developed between lake ports and northern European harbors in spite of the handicap of the present 14-foot canals in the St. Lawrence River. Briefly interrupted by World War II, direct steamship services between the Great Lakes and Europe have been resumed on a tremendously expanded scale, with six ocean steamship lines regularly engaged in the trade and with close to 100 ocean sailings scheduled for 1951.

Chicago, Milwaukee, Detroit, Cleveland, Toledo, Toronto, and Montreal are now served regularly by these important services, with other ports of call included as cargo movement warrants.

The history of the now well-established shipping service between lake ports and overseas destinations proves beyond doubt the large freight savings possible by use of direct steamers, which eliminate transshipment charges at seaboard ports and costly rail hauls to and from the interior.

The St. Lawrence is not an inland waterway or an artificial waterway—it is a natural

highway into the heart of the continent. It is basic in water transportation that ships will penetrate inland as far as possible before discharging cargo. This is proved by the inland location of many great seaports and by ocean shipping operations a thousand or more miles inland on rivers, such as the Yangtze and the Amazon. A single factor—the rapids in the St. Lawrence between Ogdenburg and Montreal—has obstructed this principle of water transportation on the St. Lawrence. These rapids are now passable by locks only 14 feet deep and 260 feet long, which limit the size of ships using the route to those dimensions.

The project thus contemplates nothing but a modernization of an existing transportation route. Ninety-five percent of the 2,400-mile sailing distance between Milwaukee and the Atlantic is now fully available for deep-draft shipping.

The cost of the engineering works in the St. Lawrence River will be shared by Canada, the United States, and the State of New York. The net cost of the project to the National Government will be a little more than \$300,000,000, or about one average day's war expenditure during World War II. This nominal expenditure is economically justified by tremendous potential savings in freight charges and electric power rates. The Department of Commerce, as recently as December 1948, estimated that traffic through the seaway, including both general cargo and bulk freight, would range from 57,000,000 to 84,000,000 tons a year.

The Department of Commerce estimated that freight savings of \$7 to \$10 a ton could readily be derived on shipments moving from overseas to Lake Michigan ports, even allowing for St. Lawrence seaway tolls on the basis of \$1.25 a ton. Even on the basis of the present 14-foot draft operation, limiting ocean carriers to about 1,600 tons of cargo west of Montreal, net freight savings of \$5 to \$10 a ton have been repeatedly demonstrated by the use of existing services.

Aside from the seaway's economic value, another factor of even greater importance is the future security of the United States and Canada. Before World War II, our military leaders urged the completion of the project for the national defense. Shortly after the end of World War II, the Joint Chiefs of Staff advised Congress that from our experience in World War II, the project is absolutely essential to the national security as a shipbuilding resource, as an additional transportation facility, and as a new source of power.

It is a national misfortune that the seaway was not developed before World War II. With it, Midwest industry and agriculture could have made a more effective contribution to the war effort, and much money and perhaps many lives could have been saved.

Our wartime shipbuilding production approached 70,000,000 tons. Sixty-five percent of the steel, machinery, and other component parts of these ships originated in the Great Lakes area. However, only about 2 percent of the completed ships were constructed on the Lakes, although we have sheltered harbors, skilled workmen, vast industries, and great steel production. Small ships were constructed in lake ports and sent to sea through the Mississippi River at great expense. The shipbuilding potentialities of the Great Lakes have hardly been scratched. The bottlenecks has been the difficulty of getting the ships to salt water.

Had the seaway been developed, we could have constructed in lake harbors, escort carriers, cruisers, destroyers, and merchant ships. These ships could have been loaded in lake ports with foodstuffs, munitions, and matériel of war, and if this seems like mere speculation, remember that Detroit was ranked as America's No. 1 arsenal, and was closely followed in war production by Great

Lakes Industrial centers such as Cleveland, Chicago, and Milwaukee.

Convoys could have been assembled in lake ports and sent to Europe with an ocean crossing 1,000 miles shorter via the St. Lawrence than from Atlantic ports. The submarine hazard would have been reduced by one-third, in terms of distance; and shipping losses could have been reduced in proportion to the saving in ocean mileage by use of the St. Lawrence.

The war has depleted our natural resources. We find ourselves with rapidly dwindling supplies of iron ore, petroleum, manganese, copper, lead, and other strategic materials necessary in war and peace. A strategic stockpiling program is now planned, based upon industrial requirements and the national defense. These critical materials should be transported and stored as effectively as possible, in sheltered interior locations, where they will be used in volume. This means the industrial area surrounding the Great Lakes.

Considering the exposure of our coasts to naval and air attack, it is sound national policy to locate strategic industry in the interior and at the same time, provide it with the advantages of ocean transportation by extending deep draft shipping into the lakes.

The seaway will check the drift of population from the Midwest to the seaboard. In recent years there has been a mushroom growth of new industry along the Gulf of Mexico and the Pacific coast. The employment offered by these new industries has encouraged many people to migrate from the Middle West to the seaboard, resulting in a rapid growth of population around the seacoast and a gradual decline of population in the interior. Between 1930 and 1940 many Midwestern States actually lost population. This trend was accelerated during the war.

States tributary to the Great Lakes normally account for 35 percent of our national exports. The foreign trade of the United States does not originate or terminate in our great seaports, but is in large measure traceable to the import requirements and the export production of the farms and factories in the heart of the country. Much of our overseas business is highly competitive and must seek the most economical transportation route.

In spite of its distinguished support the seaway has strong opposition. The principal objectors are seacoast ports, which fear the loss of transfer business between ship and rail, the eastern trunk-line railroads, which are hostile to Great Lakes water transportation, utility interests, who object not to the St. Lawrence power development, but to the fact that it will be publicly rather than privately controlled, and, finally, the coal industry, which opposes hydroelectric developments as a threat to coal markets.

The early canal builders opposed the development of the railroads, when Edison invented the incandescent bulb the gas industry declaimed the impossibility of electric lighting, the railroads opposed the Panama Canal bitterly, as impracticable, just as they today oppose the seaway. Nevertheless, the railroads were built, the automobile succeeded the buggy, electric lights have become commonplace, and the Panama Canal has joined the Atlantic and the Pacific. In each case benefits have exceeded expectations, and predicted disasters have not materialized.

History will prove the justification for the St. Lawrence, and its accomplishment is merely a matter of time. The case for the seaway has been proved and re-proved so often that its merit is axiomatic. It is not the St. Lawrence waterway which was on trial in Washington. The issue before Congress again was whether the national interest would prevail or whether the self-interest of certain powerful and articulate groups

would determine national policy. The seaway is inevitable. The only question is: How long can delaying tactics obstruct it?

American postwar planning is geared to a philosophy of expansion—greater production, full employment, expanded foreign trade, an enlarged merchant marine. The St. Lawrence seaway will help us to obtain every one of these objectives. An expanded foreign trade will cement friendly foreign relations. We need new trade routes and new traffic to support our merchant marine, the largest in the world. Full employment and full production must be geared to a greater volume of commerce and transportation. No project before the American people today will do more to accomplish these objectives than the seaway.

Not only lake ports but the inland communities of the Middle West will share in the benefits of the improved and cheaper transportation through the seaway. Untold thousands of new jobs will be created in lake ports and throughout the Middle West due to expansion of shipping operations, shipbuilding, and the multitudinous aspects of foreign trade.

To our lake ports, the seaway will mean the movement of large volumes of new commerce with added business for railroads, truck lines, stevedores, warehousemen, brokers, banks, and all of the innumerable enterprises associated with maritime activity. The seaway will act as a magnet to bring new industry to the shores of the Great Lakes seeking the most advantageous locations, with a corresponding enhancement of property values.

The project will open a new chapter in banking history with considerable expansion of foreign trade financing in the Middle West. Above all, the seaway will mean new foreign-trade opportunities for midwestern industry and new markets for midwestern farm produce.

Secretary of State Acheson has said that the seaway will increase the wealth of the United States by developing one of the greatest natural resources in the world—the Great Lakes-St. Lawrence Basin. He has pointed to the mutual benefits which will be derived by Canada and the United States in terms of new economic strength and added security for both nations. He describes the Great Lakes-St. Lawrence system as a great highway of commerce stretching for 2,400 miles from Newfoundland into the industrial and agricultural heart of the United States and Canada.

Secretary Acheson thus joins his powerful voice with those of his distinguished predecessors, with the President of both parties, and with our greatest military leaders in the unanimous conviction that the seaway will open the Great Lakes area with its vast industrial and agricultural resources to ocean shipping, will give power-deficient areas a new low-cost source of electrical energy, and will add immeasurably to the national welfare and the national security.

Gen. George Marshall, other members of the Cabinet, and the Joint Chiefs of Staff have recently urged upon Congress immediate construction of the seaway as an essential feature of the long-range mobilization of the United States. Charles E. Wilson, Director of Defense Mobilization, urged that the seaway be built for navigation, for power, and for the national defense.

Wilson told a congressional committee that the seaway, in his opinion, would pay out as a private enterprise and that he would not mind developing it as a private venture. This is a remarkable statement about a Government project coming from one of the Nation's top-flight industrial leaders, and is compelling evidence of the great economic merit of the project.

The opposition to the project is powerful and well financed, and has delayed con-

gressional action on the project for another period of time. However, the project may be approaching completion without American participation, as the Canadian Government has issued a number of strong statements indicating that if the American Congress turns its back on the project, Canada will immediately carry it to completion with Canadian financing.

Even the bitterest opponents of the project concede that it must inevitably be built. As Freeman Lincoln, writing in a recent issue of *Fortune* magazine, well said, "The things that are right and necessary in this world eventually are done. The seaway is one of those things."

Oil and Gas Possibilities in the Seventh Congressional District of Alabama

EXTENSION OF REMARKS OF

HON. CARL ELLIOTT

OF ALABAMA

IN THE HOUSE OF REPRESENTATIVES

Friday, September 14, 1951

Mr. ELLIOTT. Mr. Speaker, the demands of the defense program on our reserves of oil and natural gas are tremendous. Curtailment of imports of foreign oil will add additional burdens on our supply. Undoubtedly, exploration and drilling for oil and gas by our major oil companies, and by the independents will be stepped up.

Alabama's oil production resources are being constantly expanded by exploration and drilling in Choctaw and Clarke counties.

It is significant that on February 20, 1950, a natural gas well of commercial proportions was brought in 4 miles south of Hamilton in Marion County, Ala., in the Seventh Congressional District. This well gives promise of the possibility of a commercial gas field in Marion County. This first well has a potential of more than 2,000,000 cubic feet per day, though its conservation capacity is figured at 400,000 cubic feet per day.

Dr. Walter B. Jones, State geologist for Alabama, in an article in *World Oil*, dated July 1, 1950, and styled "Oil and Gas Progress and Prospects in Alabama," divides Alabama into seven prospective districts, and includes practically all of the Seventh Congressional District of Alabama, which I have the honor to represent here, in district No. 2, and about it, among other things, he says:

In addition to the Hamilton gas field, there was small production of gas in the Fayette gas field in 1912 to 1914. Almost every well drilled in the area reported shows of oil or gas or both.

Another important feature in this province is the series of three wells drilled by Glenn D. Rose on a structure between Manchester, Walker County, and Poplar Springs, Winston County. The first well encountered gas in Mississippian Limestone, was acidized and gaged 750,000 cubic feet of gas per day. The other two wells had good shows of gas, giving promise of commercial possibilities, and shows of oil, all in limestone.

The writer considers it a favorable prospect.

Further in the article referred to Dr. Jones says when speaking about his Dis-

trict 2—Seventh Congressional District of Alabama:

Elsewhere the Appalachians, similar areas produce both oil and gas. For this reason, and for reasons given above, this is considered to be the second best area in the State to look for production.

The Seventh Congressional District of Alabama is rich in many natural resources. Its reserves of high-grade coals will last a thousand years. Its clays and gravels are among the best. Its brown iron ore deposits are not surpassed anywhere in this country. The easy fertility of its soil, combined with its sunshine and rainfall make it a great farming district. It has great deposits of limestone which are used for building purposes. To all of these, and including its streams and timber are now added a favorable prospect for oil and gas.

Under leave already granted, I include Dr. Jones' article, to which I have referred:

OIL AND GAS PROGRESS AND PROSPECTS IN ALABAMA

(By Dr. Walter B. Jones, State geologist, University, Alabama)

With the completion of M. W. Davies et al one on the right bank of the Alabama River in the southern tip of Clarke County, Humble Oil & Refining Co has brought in Alabama's second oil field. At present, there are 42 producers in the Gilbertown field. Recent completion of a small gas well near Hamilton, in Marion County, gives promise of a commercial gas field. Last year, a shallow salt dome was discovered near McIntosh, Washington County. Thus postwar predictions of important events in oil and gas exploration in Alabama are coming to pass.

PROGRESS

Clarke County discovery. The Davies well is very important, not so much for the amount of oil it produced in its 2 days on pump (86.4 and 100 barrels per day), but for the considerable thickness of beds containing oil. It is also of interest that the producing horizon is the glauconitic sand member of the Tuscaloosa formation, Upper Cretaceous age. The horizon is productive elsewhere in the Gulf Coast region. Until the Davies well, the Tuscaloosa sand section had been dry in the score or more wells which penetrated it. In the Davies well the first oil show was encountered at 4,275 feet. From that depth to 7,342 feet, 91 oil shows and one gas show were observed. Most of these were in thin layers and beds of sand and shaly sand, too thin to produce. However, 16 drill-stem tests were made, at various depths from 4,275-85 feet to 7,314-21 feet, before the seventeenth test brought in the well at 5,419-29 feet.

Not much is known about the structure of the new field. It is thought to be an anticline, with north-south axis, parallel to and along the eastern margin of an extension of the well-known Jackson fault. Actually, the structure may cross the Alabama River into the northwestern part of Baldwin County. It is apt to extend across the cut-off, separating Clarke and Baldwin Counties.

The Davies 1 is in a swampy area, accessible only by water, except during very dry weather. Every item required for drilling and completing the well had to be shipped in by barge. The rig was located on a mound raised about 15 feet above the swamp floor. About 150 yards of causeway, similarly thrown up, connected the rig to a terminal at the river's edge, where a Bailey bridge permitted access from barge to ramp. Until more is known about the trend and produc-

tion possibilities of the structure, it is unlikely that access roads will be undertaken.

The oil from the new discovery is heavy and black, with asphaltic base, of 14 gravity, corrected. Plans for marketing the oil are not known. Oils showing in some of the sands were much lighter in color and of much higher gravity, giving promise of future production of higher quality oil.

Hamilton gas field: Also new to Alabama's oil and gas industry is the gasser, Lewis 1-A, about 4 miles southwest of Hamilton, Marion County, brought in by Harry L. Cullet, February 20, 1950. While the well had a potential of more than 2,000,000 cubic feet per day, its conservation capacity is figured at 400,000 cubic feet. The productive sand is Bethel sandstone, Mississippian age. The structure is thought to be a warp with northwest-southeast trend, perpendicular to the axis of the Appalachian geanticline.

OIL SHOWS FOUND

While not very important in itself, for the gasser is a minimum one, it is significant that several good oil shows were encountered both above and below the gas horizon. The field may produce both oil and gas. Only future exploration can give the answer to that question. Cullet is drilling a second well and contemplates others. The discovery well was completed at 1,835-1,845 feet.

Gilbertown field: This field was rather fully described in *World Oil*, September 1, 1947, and data will not be repeated in detail here. Production is against or close to a fault plane extending in a general east-west direction, on the north flank of the Hatch-etigbee anticline. On September 1, 1947, there were 21 producers in the West, and 9 in the East Gilbertown area. No more drilling has been done in the West Gilbertown area, under lease to Hunt Oil Co. However, the East Gilbertown area has been the scene of great activity, which brought the number of producers from 9 to 21. At this writing eight permits have been granted for additional wells, three to Carter Oil Co., two to Magnolia Petroleum Co., one to R. G. Houser, one to Robert Locke, and one to R. L. Lawrence. The area of proven production has been extended eastward, until it now spans about 4 miles.

In West Gilbertown, most of the wells produce about 50 barrels per day. In the east, a majority of the wells produce the allowable of 100 barrels per day. In the west, 13 wells produce from fractured zones in the Selma chalk Upper Cretaceous age, and 8 from the underlying Eutaw formation, also Upper Cretaceous. In the east, one well produces from both the Selma and Eutaw, while the rest have been finished off in the Eutaw. Chalk wells are about 2,600 feet deep, while Eutaw wells range from 3,200 to 3,500 feet. In the Eutaw formation, about six petroliferous horizons have been encountered in about 200 feet of beds.

The oil is black, asphaltic base, and 17 to 20 gravity.

Up to now, all production has been sold to Hunt Oil Co. which operates a pipeline extending through the field to a terminal on the right bank of the Tombigbee River near old St. Stephens, whence it is shipped by barge to Tuscaloosa. There it enters a refinery operated by Placid Oil Co., a subsidiary of Hunt Oil Co., and is made into various asphalt products, with excess light hydrocarbons sent elsewhere for blending into gasoline, etc. Reported capacity of the refinery is 4,000 barrels per day. The pipeline also takes oil from several wells just across the line in Mississippi.

Production from the Gilbertown field for April was 48,785 barrels, and it is likely to show a sharp increase in the next few months.

Varying amounts of salt water are produced along with oil in most of the wells.

Single wells or clusters are served by separators, and the salt water is disposed of into Wilcox (Eocene) sands. The field has water drive, though a small amount of gas is present in a few of the wells in the East Gilbertown area.

Porosity in the Eutaw formation is about 32 percent and permeability averages 150 millidarcys.

McIntosh salt dome: In 1949 the seismograph outlined and a coredrill outfit drilled into a shallow, piercement type salt dome near McIntosh, Washington County. At the point encountered by the drill, the salt core was 422 feet below the surface. Its discovery came as no surprise, for it had already been established that a deep salt basin existed in southwest Alabama. Inasmuch as no further work has been done, the diameter of the core and whether or not oil and/or gas is present must remain in doubt.

PROSPECTS

In order to accurately appraise the oil and gas possibilities of Alabama, based upon data now at hand, the State may be divided into provinces. These will be discussed in the order of their estimated importance.

1 In this area the Gilbertown field and new discovery in Clarke County are located, as well as the McIntosh salt dome. In 1945 the Boykin 1 in the northern part of Mobile County, just south of Calvert, strongly indicated the existence of a deep salt basin. Presence of the long and widely known and important geologic features, the Hatchetigbee Anticline and Jackson Fault, in this province, lent encouragement to much exploratory work, beginning more than 65 years ago. Even so, a period of approximately 60 years elapsed before Hunt Oil Co. brought in Alabama's first commercial oil well in the Gilbertown field. Most of the wells drilled in the area, prior to 1944, were without shows of either oil or gas, notable exceptions being those drilled near Mobile and at Fort Morgan, on a narrow sand spit along the southern border of Mobile Bay, all of which had gas shows. Actually, not enough drilling has been done in the area to interpret accurately its subsurface conditions and to evaluate its potentialities.

Upon the surface of this region are formations from Eocene to Recent age. All of these beds extend southward in fairly uniform thickness and characteristics, as do all of the Upper Cretaceous formations, except the basal one, the Tuscaloosa. Here the abnormalities begin, and become successively more complex downward. The few very deep wells have shown some basis for correlation with well known beds in Louisiana and Texas. Among prominent, heretofore unsuspected beds, are marine sections in the Lower Tuscaloosa formation, underlain by a considerable thickness of beds assigned to the Lower Cretaceous, which are not known to outcrop at the surface. In the Eutaw, Tuscaloosa, and underlying beds are many sand members which are ideal for oil or gas.

In this area was drilled Alabama's deepest well to date, Humble Oil & Refining Co.'s Jessie H. Williams, 2, Washington County, which went to 15,659 feet, stopping in the Lower Cretaceous.

Known structures in the province, along with two productive areas, have led the writer to believe that this is the best area in the State to look for oil and gas. In addition to normal structures, such as anticlines, fault zones, and salt domes, there is a possibility of getting production from sand lenses along the outer margins of the province.

EARLY GAS PRODUCTION

2. This province includes most of the Warrior coal basin and the area to the west and south where the coal measures plunge underneath the Upper Cretaceous beds. Structures are fairly common in this province. In

addition to the Hamilton gas field, there was small production of gas in the Fayette gas field in 1912 to 1914. Almost every well drilled in the area reported shows of oil or gas or both, mostly in formations of Mississippian age.

Another important feature in this province is the series of three wells drilled by Glenn D. Rose on a structure between Manchester, Walker County, and Poplar Springs, Winston County. The first well encountered gas in Mississippian limestone, was acidized, and gaged 750,000 cubic feet of gas per day. The other two wells had good shows of gas, giving promise of commercial possibilities, and shows of oil, all in limestone. Rose abandoned the project in 1947, and nothing has been done there since. The writer considers it a favorable prospect.

ASPHALT BEDS

Another factor having an important bearing on the potentialities of this province is the existence of asphalt beds in the Hartselle sandstone and in the Gasper and Bethel formations, at their outcrops along the northern margin of the province. The asphalt is the residue left from evaporation of crude oil at the outcrop. It is reasonable to believe that some of the oil was trapped in structures to the south, and that oil fields will be developed from these horizons.

Elsewhere in the Appalachians, similar areas produce both oil and gas. For this reason, and for reasons given above, this is considered to be the second best area in the State to look for production.

3. The area outlined in province 3 is not too well known. What information is available leads to a belief that the area contains a shallow salt basin, extending into adjacent parts of Georgia and Florida, and that oil might be found there. Outcropping in the area are beds of Eocene and Miocene age, covering beds of Upper Cretaceous age, which in turn rest on crystalline rocks of the basal complex. Whether or not beds of the Lower Cretaceous exist in the area cannot be known until a deep test is drilled. Even lacking adequate exploration, it is thought that future prospecting will justify its assignment to third place in potentialities.

4 This province includes most of the Tennessee Valley, where beds of Mississippian age outcrop over most of the area, with a few small patches of Silurian beds along the northern fringe. On the southern margin of the province are Coal Measures, which also cap mountain tops in the eastern part.

In 1865 two wells were drilled in Lawrence County to a supposed depth of 700 to 800 feet, the first to be drilled for oil in the State. It was reported that one well had oil shows. In 1890, goyer 1 was drilled in the same county. At a depth of 1,509 to 1,529 feet, oil was reported to have risen 400 feet in the casing. Eight barrels were drawn out, and casing was ordered. Ultimately the casing arrived and was set. No oil showed up. The well was then shot with 100 quarts of nitroglycerin, which lifted the casing to the top of the derrick. Still there was no oil, and the project was abandoned. The oil recovered was green in color and 46 gravity. Recently, B. E. Davis drilled a well at or near the same spot, with shows only in the Hartselle, at a shallow depth. It is now thought that the goyer 1, which had no casing in the hole, received its oil from the Hartselle, and not from lower beds.

EARLY PRODUCTION

Also in this province, at West Huntsville, gas was produced on a small scale, from wells about 385 feet deep, in 1905-08.

Practically all wells drilled in this province have reported shows of oil or gas or both. The area does have possibilities, and is assigned to fourth place on its record.

5 This is a province of unknown possibilities. The northern part of the area com-

prises beds of Upper Cretaceous age, covering folded and faulted Paleozoics on the west and crystalline rocks on the east. It is likely that this part of the area has little actual chance of making a commercial field. However, the chances are much brighter in the lower part of Butler County, and in Conecuh, Covington, and Escambia Counties. It is possible that this part of the area may rival Province 3 or even 2 in importance. It does have a sufficient thickness of cover. However, there has not been enough exploration to properly evaluate its position.

6. In this province are highly folded and sharply faulted Paleozoics, lightly covered along the southern margin by basal beds of the Tuscaloosa formation on the west, and thinly blanketed crystallines on the east. While oil and gas may occur here in commercial quantity, the chances are not very bright.

7. This is the area of crystalline rocks, in which neither oil nor gas would be expected to occur.

Amendment of United States Code— Copyrights

EXTENSION OF REMARKS OF

HON. JOSEPH R. BRYSON

OF SOUTH CAROLINA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. BRYSON. Mr. Speaker, the bill I have introduced, H. R. 5473, would amend section 1 of title 17 of the United States Code, "Copyrights." Under that statute as presently constituted the public rendition of a musical composition upon a coin-operated machine, such as jukeboxes, does not constitute a public performance for profit unless an admission fee is charged.

The purpose of my proposed amendment is to place owners, operators, and distributors of coin-operated machines—so-called jukeboxes—on the same basis as all other commercial users of music. Under this amendment, jukebox operators of two or more machines would be required to pay compensation to copyright owners for the right to perform their musical works publicly for profit.

The proposed amendment would continue to exempt from any obligation to pay royalties the proprietors of small taverns and other establishments where coin-operated music machines are placed. Instead, responsibility for payment would be upon the owners, operators and distributors of such machines who control several or many such machines by placing them singly in various establishments or by sharing in the proceeds.

I am happy to join with my distinguished colleague in the Senate, Mr. KEFAUVER, of Tennessee, in sponsoring legislation which would compensate American composers and authors for the widespread use of their music for profit upon coin-operated machines.

The measure I have introduced does not differ in substance or aim from S. 1553, the bill introduced by the Senator from Tennessee. My bill does, however,

contain some variations in phraseology from S. 1553.

After discussing the measure with the eminent chairman of the House Committee on the Judiciary and with the committee's legal staff, I feel that these changes serve to clarify the intent of the legislation without modifying its essential purpose.

Will Some One Please Answer This Fair Question—Why Must This Outrage in Korea Continue?

EXTENSION OF REMARKS

OF

HON. BEN F. JENSEN

OF IOWA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. JENSEN. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following letter:

AUGUST 28, 1951.

HON. BEN F. JENSEN,
House Office Building,
Washington, D. C.

DEAR MR. JENSEN: Less than 6 months from the time of his enlistment in the Army our only son was put on the front line in Korea. Needless to say we are heartbroken over the whole business. First, I would like to explain a few things to you to make you see why we are especially bitter about this. In the first place we didn't want him to enlist. He was just out of high school, had never been away from home and we felt he should have at least a year away at school before he entered the service. He couldn't see it that way, however, because so many of his friends had gone in either the Navy or Air Force. If he insisted upon enlisting we felt that either of these branches would be best. But he couldn't pass the physical for either of these branches because he was too small. He is only 5 foot 3 inches and weighs about 109 pounds. But the Army took him all right. We then wanted him more than ever to go away to school and wait to be drafted, feeling that he had nothing to gain by enlisting. But, oh, yes. They told him at the Army recruiting office that if he enlisted he could get in just what he wanted because so few were enlisting. How they can lie to these boys the way they do is beyond my comprehension. So they put him in the combat engineers, demolitions. Of all the places to put a boy who was too small for the Navy. One wonders where they find men to run things in an Army who would do that. Not that he is any better than any other boy. I certainly don't mean that, but it just doesn't make good sense, now does it? Are you surprised that we feel as we do? It does really seem as if he has been pushed around an awful lot since the Army got him. He wanted to go to carpentry school or any other number of things and never wanted to be in the combat engineers. As his dad said, "The kid wasn't good enough for the Air Force or Navy, but he was good enough to be given a rifle and put on the front line in Korea." If he was in an Army that was fighting to preserve our country or our traditions I think I might feel entirely different than I do. But there is not one bit of sense in our troops being on the other side of the world fighting in a country we don't own or don't want.

Why must this outrage in Korea continue? Our being over there in the first place was

a tragic mistake, and after more than a year of fighting and pure hell for our boys, and over 90,000 casualties, we are no further along than when it started. I wrote to Mr. Truman when we found out our boy had to go over. The reply came from the office of the Adjutant General and was about as cold and formal a letter as one might expect to get and said exactly nothing. How can pressure be brought about to get those boys out of that place? It isn't humane to leave those kids over there through another Korean winter.

I am going to copy down some excerpts here from the few letters we've received since our boy got there: "Well they finally got us all split up. I don't know what my address is yet but I sure hated to leave all my buddies. I was more homesick last night than I have been since I joined the Army. I am going to the front line and I guess they haven't called a cease-fire yet as they had made us think. (Note: up until the day he left for the front line they had told them there had definitely been a cease fire—more lies). Boy, when I get home I am never going further away than Omaha. You don't realize how nice home is until you are so far away and can't get back. I really miss all of you, but please don't worry about me. I can take care of myself and I want everything just the same when I get back. Will be here for a long while but the time will pass before you know it and we will all be together again. I am just waiting for the truck to come and take us up. We were supposed to go up last night but some bridges were washed out and we were cut off from the front lines." From another letter: "We got to our company last night. This is sure a hole up here. We are on the front line now and I don't think anyone could realize what a desolate place this is until they came here. I know I didn't. We need 36 points to get rotated out of here and that means 9 or 10 months on the front line. I think of you folks all the time and hope you are fine. I haven't had any mail for 3 weeks but it will probably catch up with me in a week or so."

A later letter: "Boy, some of these guys have surely been through hell. This is going to be hard to take for 10 months or so. Guys in the Air Force and Navy don't know how good they have it. They at least have a bed or a cot all the time, hot food, and clean clothes. We are on the move all the time. Sometimes we sleep in fox holes and sometimes we have to sleep on the ground, and in pouring down rain it is pretty rough. This outfit has been on the front 95 percent of the time. Some of these boys have been up here 7 or 8 months without any rest, and that is plenty rough. I think the combat engineers are as rough as any other outfit there is, and yet nothing is ever said about the guys who go ahead of the tanks and clear mines while the Chinks have the road zeroed in and throw everything they have at you, and you can't even jump in a hole. Will you send me some snapshots of your folks if it wouldn't be too much trouble? How is Jet? (Note: Jet is his dog) Mom, will you do me a favor? Will you talk about me to her once in a while so she won't forget me?"

Everyone you talk to and everywhere you go you hear the same thing about this Korean mess, and that is that we have no business being there, and we should get those boys out of there. If it made any sense at all it would be different, but what is it for? No one knows. Nothing is done about it, but something should be done. Isn't it possible to do something about this tragic situation? This cease-fire hokum has been such a farce that even a child can see through that. It is very obvious that our leaders don't want peace any more than the other side does. Is there a single right or just reason for keeping our boys over in a place so wretched and

living in conditions so terrible that we wouldn't even subject our dogs to? And should they have to go through such torture when they aren't even old enough to vote? It is criminal and an outrage. They should be back in the United States. We need them here, and this is where they have every right to be. Let the ones who want war fight it. Believe me, Mr. JENSEN, I am very earnest about this thing. I feel so keenly about the injustice of the whole business that there isn't anything I wouldn't do to help get a movement started to demand the return of our boys to our country. I think we should help the Korean people to the extent that the other U. N. do, but no more. That is, I do feel we should send them supplies, money, and equipment, but I most emphatically do not think we should send them our boys. Please do everything humanly possible to try and rectify the ghastly mistake that was made when we first got our necks thrust in this mess.

Believe me, I am most sincerely grateful that you have read this through.

Respectfully yours

Address by Brig. Gen. H. M. Milton II, at Dedication of ORC Armory, Scranton, Pa.

EXTENSION OF REMARKS

OF

HON. HARRY P. O'NEILL

OF PENNSYLVANIA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. O'NEILL. Mr. Speaker, under leave to extend my remarks in the RECORD, I wish to include the following address by Brig. Gen. H. M. Milton II, at the dedication of the ORC Armory, Scranton, Pa., on September 18, 1951, which is the first ORC Armory completed in the United States:

It gives me great pleasure to be here tonight at this dedication of the Scranton ORC Armory—concrete evidence to members of the United States Army Reserve and to you guards, that the Organized Reserve Corps, part of our country's defense in depth, is here to stay.

With completion of this armory, the units and individuals of the Organized Reserve Corps in the Scranton area are assured of an appropriate place to train for their vital mission of being ready for service in time of emergency, and are assured that the work to which they have dedicated themselves as citizen-soldiers will go forward.

Our Nation has moved into a critical period in its history. Our military forces are fighting in Korea in a conflict which has resulted in more than 200,000 Reserve officers and enlisted men being called to active military service. You of Scranton know already the part your sons, brothers, and husbands are playing in this emergency. This armory will assure that others who may be called to duty in the future will be better prepared for the mission they have willingly and patriotically assumed. There are many problems to be overcome before we achieve adequate preparedness. The principal problem is money with which to provide armories and equipment; of money to support Reserve troop program units; of money with which to give them some payment in token of a nation's gratitude.

The problems of money are being solved to some extent. This armory shows that.

Here, you as reservists can literally get your feet on the ground. You have the facility and you will have the supplies and equipment that will train you to be more proficient in the art and science of soldiering. I am reminded of the mythological Greek, Leonidas, the great wrestler whose strength was literally drawn from the ground on which he stood. Standing, he was an invincible wrestler. His opponents learned of his strength and defeated him by lifting him aloft where his feet could not touch the ground. Here is the ground from which your strength as reservists will stem.

The Congress is very much aware of the need for a strong and active Reserve Force. This armory was built from a \$13,000,000 fund appropriated in 1950 for construction of 44 armories and purchase of 8 additional buildings suitable for armory use. At present we are engaged in working out the details for the 1953 armory construction program calling for expenditure of \$16,000,000 for armory construction or purchase.

Many of you may not be aware that the Congress is now holding hearings on a proposed new law to govern the Reserve forces of our Nation. This blanket legislation, sometimes referred to as the Magna Charta of the Reserves, will govern all phases of our military activities.

It will establish a Ready, a Standby, and a Retired Reserve for all civilian components of the Armed Forces, and equalize benefits among the Reserve and Regular Forces. As presently considered, the new law will include in the Ready Reserve all members of the existing Organized and part of the Volunteer Reserve of the United States Army Reserve and will place all other members of the ORC in the Standby Reserve. Each reservist will know his general status with respect to when the active Army will need him in any emergency.

Under present planning, men coming out of their period of obligation under universal military service and training will be placed in the Ready Reserve to serve the remainder of their Reserve obligation. After a specified time in the Ready Reserve they will, if they so desire, move to the Standby Reserve, as will present ORC members, and finish out their Reserve obligation there. Those who have completed their service to the Nation, or who are otherwise unable to continue in the Ready or Standby Reserve will move into the Retired Reserve, if eligible.

Studies are currently being undertaken by the Army, at the request of Congress, to work out a satisfactory promotion system for reservists, and study is being given to offering some form of contractual agreement to reservists called to duty outside of a state of war. Should a contract with a reservist on active military service be terminated before the contracted time has expired, that reservist would receive severance pay. As the bill now reads the contract for actual service would run for not to exceed 5 years. I emphasize that this is still legislation to be acted upon in both houses of the Congress.

These legal preparations for the welfare of the reservists of our Nation are recognition of the role you play in the national defense. As reservists you are truly the Nation's defense in depth. I realize that for some of you there is pay for your Reserve duties, and that for many of you there are retirement benefits to be looked forward to. But I know, as does the rest of the Nation, that the modest pay you receive and the retirement benefits are not the reason you joined or remain in the United States Army Reserve. Americans do not talk much about patriotism, nor are they ardent flag wavers, but I know that practically every reservist is in the corps for patriotic reasons.

You are in for the same motive that impelled the poet to write:

"Breathes there a man with soul so dead,
Who never to himself hath said,
This is my own, my native land!"

I am reminded of a story, written in poetic form, of a hero of ages long gone, who seized a discarded and broken sword, called to his followers the word "Excelsior," and turned victory into defeat. His predecessor had discarded the worthless sword and died in anonymity—but he, with courage and a broken blade snatched victory from defeat and won a hero's fame. Emerson in his "Essay on History" made the statement that "the ages must instruct the hours, and the hours explain the ages." When you think of the troublous times in which we live, the two parables of the sword and the ages have a peculiar significance.

Here we have a greatly diversified Nation. We have developed our mines, our farm lands, our arid and barren regions and our forests until we are the envy of the world. This is the land our history books tell us was once scorned by Europe. Only the improvident or the seekers after individual freedom came to our shores. We mixed the bloods of all into one nation and through our own exertions made it the mightiest Nation the world has ever known.

But natural resources were not what made this a great Nation. Other areas of the world have resources in greater abundance. But they have not produced a nation such as ours. The answer lies in our people. Here, and in no other place, has man found means to live with the minimum restraint to himself. This is the criteria to which history has taught us to aspire, and having reached a degree of success, this Nation, like a successful individual, finds itself confronted with envy. Envy so great that it would throw civilization back into the dark ages rather than to see our Nation continue its progressive role. Hence, America finds herself in a critical period—not only critical for itself but for all civilization. For as General Bradley has said, we seek nothing for ourselves that we do not seek for others.

Historians in coming ages will explain that America preserved its own culture and civilization by following the advice of John Philpot Curran who declared that eternal vigilance is the price of liberty. It is regrettable that this vigilance has led us to the brink of war and that our comrades must fall on foreign battlefields. But the American heritage must be preserved at all costs. As evidence that you believe this as firmly as I do, I need only point out that you are here in uniform, and ready to take up arms if needed. You have left the comforts of your homes to take part in the dedication of an armory in which you will train to gain advancement in the profession of arms which you as civilians embraced of your own free will.

Do not feel that you are not serving your Nation in this time of peril by remaining at home while others of the Reserves are fighting the common enemy in Korea. We at home are the second line of defense. The poet Milton wrote what could well be our motto: "They also serve who only stand and wait." We all have a tiring but nevertheless important role of waiting. During this period granted us we must prepare for the future. God grant that by being eternally vigilant we may turn aside the horror of outright war . . . that by being powerful and steadfast we may bring fear to the heart of the aggressor and so spare our beloved land from war's fiery blast. Many of us have seen war at first hand and we know that in the future our homes will not be spared. Therefore let us arm our-

selves with weapons and with knowledge of their use and like Jefferson swear eternal enmity to all forms of tyranny over the mind of man, and by being vigilant keep the enemy from our shores.

We are here tonight to dedicate this armory to the strength of our beloved America. Even more, we are here tonight to dedicate this armory to you, our country's sons and daughters, who stand ready to take up arms in her defense. Here you will train, and God willing, your sons and daughters will train to preserve America. In a greater sense you are training here to preserve yourselves, for you, the people of this land, are America. In this building and with you who will use it, lies America's future. That there will be a glorious future, just as there has been a glorious past we may all rest assured. As long as we have our citizen-soldiers as a bulwark against evil forces this Nation cannot be overthrown.

I think it peculiarly appropriate at this time, when America is meeting aggression head on, that we should gather here to dedicate this armory for the use of peace-loving men and women, who, nevertheless are determined to bear arms if necessary in defense of the freedoms and beliefs for which Americans have always fought, and for which, under God, they will always fight.

Sofiero Castle to Congress

EXTENSION OF REMARKS OF

HON. ALFRED D. SIEMINSKI

OF NEW JERSEY

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. SIEMINSKI. Mr. Speaker, recently I wrote the King of Sweden and thanked His Majesty and His Majesty's government and people for their courage and kindness in giving asylum to 16 Polish refugee seamen and flyers. In the letter I urged the King not to be concerned by any grunts snorted from the direction of the Russian bear demanding the return of these unfortunates to Communist-dominated, Soviet-controlled Poland where they would be slaughtered. I am pleased to list below the reply to my letter from Sofiero Castle, Sweden:

SOFIERO CASTLE,

Hälsingborg, September 14, 1951.

Mr. ALFRED D. SIEMINSKI,

Congress of the United States,
House of Representatives,
Washington, D. C.

DEAR MR. SIEMINSKI: I am desirous by His Majesty the King to thank you most heartily for your kind letter of August 13, which His Majesty has read with keen interest. Your letter ought to have been answered long ago, but a change of personnel has caused a delay, which I sincerely regret.

His Majesty appreciates the frank sentiments contained in your letter and sends you his best greetings.

Yours sincerely,

CARL-FREDRIK PALMSTIENA,
Private Secretary to His Majesty the King.

Mr. Speaker, it might also be of interest to know that my message to the King appeared in one of the largest newspapers in Sweden, under a United Press release. A letter from one Richard

Sieminski—do not know him—in Sweden tells me the letter made quite an impression on the public. I would like to thank the State Department and especially Jack McFall for their part in this exchange of good will. And to Carl-Fredrik Palmstierna, private secretary to His Majesty the King—much obliged, chum. Give the King our best.

Impact of United States Foreign Policy on the Domestic Economy

EXTENSION OF REMARKS

OF

HON. WILLIAM F. KNOWLAND

OF CALIFORNIA

IN THE SENATE OF THE UNITED STATES

Wednesday, September 26, 1951

Mr. KNOWLAND. Mr. President, I ask unanimous consent to have printed in the Appendix of the Record an address I delivered last night to the Associated Traffic Clubs of America, meeting in Seattle, Wash. Due to the fact that the tax bill was under consideration in the Senate, I was not able to be present in person in Seattle, but I delivered the address from my Washington office over a transcontinental telephone hook-up arranged by the Associated Traffic Clubs.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

SPEECH OF UNITED STATES SENATOR WILLIAM F. KNOWLAND, OF CALIFORNIA, BEFORE THE CONVENTION OF THE ASSOCIATED TRAFFIC CLUBS OF AMERICA, SEATTLE, WASH., SEPTEMBER 25, 1951

Mr. Chairman, Mr. Fitzgerald, delegates to the convention, first of all let me say that I regret not being able to be present in person at your Seattle meeting. Voting on the important tax bill on the floor of the Senate made it necessary to cancel my airline reservations last night.

No prudent person can ignore the impact of our foreign policy on our domestic economic system. Government spending today is a most inflationary factor in our economy and has been to a large extent the additional pressure making necessary economic controls.

As citizens of this constitutional republic, we are faced with a challenge unparalleled in our history.

During our 175 years as an independent people, we have heretofore been challenged on several occasions by those who would destroy us or limit our horizons.

Slow to anger, naive at times in our trust in others, we have, when sufficiently provoked, opened the throttle wide to make the all-out effort necessary to defeat the enemy and bring about a complete victory at the earliest possible date. This determination was perhaps best expressed by Admiral David Farragut, at Mobile Bay, August 5, 1864, when he said:

"Damn the torpedoes; go ahead."

To win past victories the necessity of which was clear to all we accepted the drafts of manpower, the sacrifices of our Armed Forces, the controls of our economy, the taxes upon individuals and upon business, as part of the common effort. We were never certain as to how long it might take, but even during the dark days following Pearl

Harbor and Bataan the overwhelming majority of the American people were never in doubt that ultimate victory would be ours.

As a member of the Armed Services Committee, which heard testimony for approximately 2 months, I was shocked to hear witness after witness, high in the councils of our Nation, tell why we couldn't win a victory in Korea over Communist aggressors who have been designated by the United Nations as outlaws.

Among the reasons given were fear of what Communist China might do, fear of what the Soviet Union might do, or fear of what our allies might do or say. This Nation was not built by men motivated by fear, but by those motivated by faith and courage.

For the first time in our history, we have wartime casualties, taxes, economic controls, and manpower mobilization while in a twilight period which is neither peace nor war. There are some high in the councils of the Government who tell us this condition may prevail for 10 years.

Our challenge is how to meet the menace of aggressive communism while we maintain our constitutional representative government and our free-enterprise system. That we will win, none of us should doubt, but if in the winning we sacrifice that which has made America great, it will be at such a price that future generations may wonder if more intelligence would have found a better way.

In this country, as yet, the people run the Government rather than the Government running the people. But we have trod the path of big government about as far as a free people dare go without taking stock of the situation and determining what our future course of action should be.

Our budgets have grown to such astronomical figures that it is hard for our citizens to grasp the full significance of the amounts being spent and proposed.

Our budget for the fiscal year 1952 approximates what our total public debt was at the end of the fiscal year 1942.

As a boy I grew up part of the time in Washington where my father represented the Sixth District of California in the House of Representatives for the 12-year period 1903 to 1915. In 1910 the total appropriations for all functions of Government, including the military, reached \$1,044,433,622. It was front-page news all over the country. We had become a "billion-dollar Government." For the current fiscal year, the President has proposed a \$71,500,000,000 budget.

Our foreign policy has a direct relationship to our military policy. Our Armed Forces under the proposed budget for the next fiscal year will take approximately \$60,000,000,000 out of a \$71,500,000,000 total.

The total value of all farm production in the United States for 1950 was an estimated \$30,400,000,000. The budget submitted by the President for this fiscal year will be more than double that amount for the Federal Government alone. State and local costs of government are in addition.

After years of savings the American people have accumulated in their savings banks, building and loan associations, and the Postal Savings System \$59,690,000,000. This entire amount would not quite pay the annual cost of our armed services.

In the 152 years from the day George Washington took the oath of office as President of the United States, through the second 4-year term of Franklin D. Roosevelt, the total cost of the Federal Government amounted to \$180,000,000,000. In the 7 years of this administration, the cost will amount to over \$320,000,000,000.

Last year, the United States Government raised in Federal taxes \$50,300,000,000 which was the largest "take" in our history. It exceeded 1945, the high year of World War

II, by almost \$4,500,000,000. Despite this high income into the Federal Treasury, the President has asked for \$10,000,000,000 more in new taxes and the Congress will approve a bill approximating \$6,000,000,000 of that amount.

My State of California, now the second largest in population in the Union, and endowed with vast natural resources, fertile farms, and diversified and prosperous industry, has a total assessed valuation of \$15,000,000,000. California's share of the national debt on a per capita basis, amounts to over \$18,000,000,000. Our national debt stands at over \$256,000,000,000 and the interest alone now amounts to over \$5,500,000,000, which is greater than the total Federal tax receipts in 1940, which amounted to \$5,300,000,000.

Since Columbus discovered America, the total world's gold production has amounted to approximately \$42,000,000,000. Preliminary estimates are that next year the Federal Government will have a budget of more than double that amount.

Never have so many people had so much at stake as do the people of America. We do not want to be faced with the Hobson's choice of aggressive communism or state socialism. Neither is suited to America's present or future needs. The former could be imposed upon us if we were defeated by the Soviet Union. The latter, however, might result if we were the victor rather than the victim. No policy which would place the albatross of state socialism around the neck of the American people is the solution to the problems which confront us.

Our job then is to seek alternatives which do exist.

Every American citizen having a sense of responsibility fully recognizes the fact that the free way of life is being challenged by international communism. He knows that the victory for International Communism would be more costly in human liberty, in looting and in reparations than even those vast astronomical figures we have discussed.

I believe that our people are prepared to carry the heavy burdens of necessary defense expenditures and for the essential functioning of the Government. They have a right to expect, however, that all unnecessary fat will be cut off the budget and that a full dollar's worth of value is received for every dollar spent in the military as well as the civilian establishment.

Our economic system is tied with Siamese-twin attachments to our constitutional form of government. If one is destroyed, they both perish. There is no need for either catastrophe to happen if we get off the perpetual defensive and take the offensive.

There are too many people who have had our hospitality or advantages joining forces with Moscow and her satellites in spreading their views on "what's wrong with America."

Those who believe in our system should start a crusade to tell "what is right with America."

We, of course, will not close our eyes to the liability side of the ledger, but as citizens with our feet on the ground and common sense gained from experience and observation we know that America's assets in freedom of religion, speech and press, and in agricultural, educational, fiscal, industrial, and governmental categories, to mention but a few, greatly exceed our liabilities.

Seventy-eight million life-insurance policyholders own policies with a face value of an estimated \$228,000,000,000.

Individuals who still believe that thrift is a virtue, also own directly or through institutions for their account some \$56,790,000,000 in savings institutions and \$2,900,000,000 in the postal-savings system. A substantial

part of the \$35,000,000,000 of time deposits in commercial banks is theirs. They also have a stake in annuities and pension funds, amounting to an estimated \$5,000,000,000, and a direct stake in the social-security system (Federal, State, and local) of \$29,000,000,000.

We have more stockholders and home owners than any other nation in the world.

To permit this solvent, going concern of ours to be liquidated by the strong-armed action of international communism or to consent to the voluntary bankruptcy proceedings of state socialism are both unthinkable and unnecessary. We need an alert and determined citizenry if the battle is not to be lost by default.

We must not let complacency destroy the spirit that has developed a great world power out of a small colony in less than 175 years. We must not build or depend upon military or economic Maginot lines.

This Nation has never been wedded to the status quo or ruled by the dead hand of the past. Our economic as well as our political system broke away from old-world patterns.

Short-sighted European-style capitalism built the gallows for its own execution by allowing and encouraging monopolies, cartels, low wages, and great aggregations of capital narrowly held.

The lifeblood of our system to the contrary is competition, productivity, good wages, and widespread ownership of our economic structure.

We must continue to demonstrate to the world that here in America we have political and economic freedom. Here our people, since the founding of the Republic, have looked forward to leaving to their children a better land than they themselves found.

The challenge we face is to meet the economic, social, and political need of the twentieth century while we maintain free institutions under a constitutional government.

Certainly security alone is not the whole answer. The most secure man is the one who has his clothing, food, medical care, and housing guaranteed for life—as an inmate of a State prison.

The sustained stability and progress of our American system of capitalistic free enterprise requires high real wages, sustained buying power for abundant markets, and maximum production at low unit costs. American agriculture, labor, and industry must not be undermined by the dumping of goods produced by low-paid labor abroad while outside markets are closed to our products.

In meeting the growing challenge of socialism and communism the dynamic American system must continue to demonstrate that labor, management, and investors all have a vital interest in maintaining our way of life. High productivity and widespread distribution of that which our Nation can produce is more sound than the doctrine of scarcity brought about by stoppages of production or by governmental action.

In the growth of our economy there have developed powerful groups in business and in labor. Not all of them have recognized that with power must go responsibility. No man or group of men in the ranks of labor or business has the right to strangle the economic life of 150,000,000 Americans and by so doing endanger the entire free world.

The Government of the United States established economic traffic laws many years ago to protect our businessmen and consumers against unregulated monopolies. These were the antitrust statutes.

More recently, first through the Labor Relations Act of 1935 and later through the Labor-Management Relations Act of 1947, the Government has sought to establish a

national labor policy that would be fair and equitable not alone to labor and management, but to the general public as well.

While some well thought-out amendments are in order, they should be weighed in the light of their effect upon the entire population, and not just one part.

Our entire national economy must not be at the mercy of one man or small group who can give an order that will cause a creeping paralysis to close down our mines, factories and transportation systems and work a hardship on countless people. This is far too much power for any responsible man to want and any irresponsible man to have.

There are some in Government who apparently believe that if an individual spends his own money it is inflationary whereas if the Government takes it from him and spends it, such is not the case. This is economic nonsense and squirrel-cage thinking. Government spending has been and is, a major inflationary factor.

I make no claim that we can "unscramble the eggs" of Government finance, but I do maintain that we should no longer ignore the warning lights that have led to disaster when ignored elsewhere in the world.

We have embarked upon a program of helping to establish a system of international law and order so that the peace of the world may be secure to ourselves and to our children. This has led to the development of a collective security system represented in part by the United Nations organization, the North Atlantic Alliance and the more recently negotiated Pacific pacts. The success of any such a collective security system rests upon the emphasis placed on the word "collective."

To date the system leaves much to be desired. When aggression took place in Korea on the 25th day of June 1950, the United Nations under the leadership of the United States, promptly took action to resist this act of overt aggression from the Communist world.

We gain nothing, I believe, by misrepresenting the facts to our own people or to the people of the free world. Despite statements to the contrary from those holding high positions in our own Government and in the United Nations Organization, it is not true, and I underline the word not, that the free world sprang to arms to resist aggression.

Fifteen months have now passed, and fighting is still going on in Korea and casualty reports are still coming in. Yet a year and a quarter after the aggression commenced, the United States of America alone is supplying more than 90 percent of the forces engaged in the Korean operation.

Of the 60 members of the United Nations, only 15 of them have sent combat forces to Korea, and all of them together have supplied something less than 35,000, which happens to be the approximate number offered by the Republic of China on Formosa, 4 days after the aggression started. Yet the offer of the Republic of China was declined by the United States and the United Nations partly because of the fear that it might cause the Chinese Communists to intervene. This they did 5 months later on their own account.

I believe that the executive branch of the Government has been derelict in not accomplishing a higher measure of support from the other United Nations members than is represented by the 10-percent contribution already mentioned.

Certainly neither the American Congress nor the American people are willing to accept any such basis as a precedent for future collective security action. The sooner this fact is understood in the chancelleries of the free nations of the world, the sooner we will be on a more realistic basis insofar as collective security is concerned.

In 1945, there were approximately 200,000,000 people behind the iron curtain. Today, there are over 800,000,000 people in the Soviet orbit.

If international communism is allowed to digest this great mass of humanity, the balance of power in the world will be upset and other nations in close proximity to the Soviet orbit will find themselves under relentless pressure. Given time to consolidate their position, the rulers of the Soviet Union and its satellites will be able to liquidate non-Communist elements within their boundaries.

For more than a decade, the Soviet Union has used its embassies and consulates as centers of espionage and fifth column activity. The time has long since come and passed when notice should be served upon them that their representatives in the United States will receive the same treatment accorded ours in the Soviet world. We should get on a quid pro quo basis now and if they are not willing to accept the same terms and conditions for their officials here that they extend to ours there, we should take the inevitable step of withdrawing our ambassadors and send theirs home forthwith.

In addition, for more than a decade, the Comintern has sent its agents abroad throughout the world to undermine the economic and political life of the free nations.

The time has come when the free people of the world should recognize the fact that behind the iron curtain now and as yet unliberated are literally tens of millions of people who have the same yearnings for freedom that we have. A real effort must be made to enlist as the allies of freedom, the oppressed people of Poland, Czechoslovakia, Lithuania, Latvia, Estonia, Hungary, Bulgaria, Rumania, and Communist China and indeed of the Soviet Union itself in the cause of freedom. If these people had the moral support of the free world and the realization that they were not permanently abandoned to their Communist masters, they would be a tremendous ally in the years ahead. The encouragement of moral support and material aid could be done at a far less cost than 10 years of the type of cold war now contemplated.

It is Communist doctrine that the free world and its economic system contains within it the seeds of its own destruction. It has long been my belief that it is far more likely that the Communist world contains within its structure the seeds of its own destruction. Sufficient intelligence must be given to find the cracks in the iron curtain.

In order to enlist free people everywhere, it is essential that we have a foreign policy which we and they can understand.

We must reassert the moral leadership that we lost at Yalta. There we gave to the Soviet Union that which was not ours to give. It was done without the knowledge or approval of the American people or the American Congress. It was done without the knowledge or consent of our long-time friend and war-time ally, the Republic of China.

This agreement and those which preceded and followed it, contributed to the loss of the freedom of the people of Poland.

Since the Soviet Union has long ago violated its part of the Yalta agreement and all other agreements, when it suited their purpose so to do, the time has come when the Government of the United States should denounce the Yalta agreement and serve notice that never again will we barter away human freedom in a secret conference by an agreement contrary to our constitutional requirement of the ratification of treaties by the Senate of the United States.

If we now declare that our foreign policy is based on human freedom, and what ad-

vances it we support and what retards or destroys it we oppose, we will furnish new hope to the oppressed people of the world, new courage to our free allies and have the basis for a workable policy that will be entitled to bipartisan support in the Congress and the overwhelming approval of the American people.

If we will use some of the same courage and common sense that motivated the men that sat at Philadelphia and gave us the Declaration of Independence and later the Constitution of the United States, there are none of our domestic problems we cannot solve and there is no foreign foe we need ever fear.

Address by Hon. Hugh G. Grant, Former Ambassador to Albania

EXTENSION OF REMARKS

OF

HON. JAMES P. RICHARDS

OF SOUTH CAROLINA

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. RICHARDS. Mr. Speaker, under leave to extend my remarks in the RECORD, I include a recent radio address of that distinguished citizen and public servant of the United States, the Honorable Hugh G. Grant, former Ambassador to Albania:

RADIO BROADCAST BY MR. HUGH GRANT GIVEN ON AUGUST 15, 1951, OVER WGAC IN AUGUSTA, GA.

STAFF ANNOUNCER: Once again WGAC is pleased to present Mr. Hugh Grant, former United States Minister to Albania and Thailand. Mr. Grant has spent the last few days in our Nation's Capital at the invitation of His Majesty, King Zog, of Albania. This evening Mr. Grant will give an account of his visit in Washington—Mr. Grant.

"I have returned to Augusta, Ga., today from Washington. As previously announced over the radio and in the Augusta press I went to Washington upon invitation of His Majesty King Zog of Albania, who is making his first visit to the United States. The King is in exile in Egypt, his country having been overrun first by the armies of Mussolini while I was serving as United States Minister to Albania in 1939. Next came the Nazi hordes of Hitler and finally near the end of World War II, the Red armies of Stalin. Albania is behind the Russian iron curtain today, presenting one of the most tragic situations of all the conquered countries of Europe.

"The meeting with King Zog in Washington was the first since my last audience with His Majesty on the day before the Italian military invasion of Albania on Good Friday, April 6, 1939. Under King Zog's immediate direction the small Albanian Army resisted the Italian invaders driving them back to their ships at Durazzo but were soon overwhelmed by superior forces. To escape capture by the Italians the King sent his Queen and their 2-day-old son out to Greece at day-break on the day of the Italian attack and that night when all was lost for the small Albanian forces with the Italian Army marching on the capitol, Tirana, King Zog with his principal officers and cabinet ministers followed the Queen to Greece. The King related to me how from Greece he and his party went to Turkey, thence to Scandinavia, France, and finally to England. The King was in England during the early part of the great war and for some time

thereafter. He was active in trying to bring about, from London, an organization of Albanian military forces that might eventually have kept Albania out of the hands of the enemy and as a part of the free Western World. But there were many political obstacles in the way over which King Zog had no control and the plan never materialized. Finally the King made his way to Egypt where he has many powerful friends. The King is an astute courageous military leader, highly educated, cultured and intensely loyal to the cause of complete Albanian independence. When Albania is free again the King would have the people decide what sort of government they want. What King Zog desires is to see Albania free of foreign domination and to take her place among the freedom-loving nations of the world. The King is ready to do anything that he can, involving any sacrifices, in order to bring this about.

"King Zog is still a young man in his early fifties and, as I saw him on several occasions in Washington during the past few days, as youthful looking as he appeared during that last audience I had with him on the eve of the Italian attack.

"King Zog's party in Washington comprised his nephew, Prince Tali, who was a youth when I was in Albania, a distinguished Egyptian, Pasha Mirahil, legal adviser to His Majesty and to His Majesty King Farouk of Egypt, Colonel Selmani, Mr. Von Blomberg, of Boston, and Mr. Sagiri, aide-de-camp to King Zog. I cannot go into the details of my conversations with King Zog, but it is sufficient to say that His Majesty is exceedingly well versed in the political knowledge of Continental Europe, the Balkans, of which the King's country, Albania, is an important part, and the whole Middle East. King Zog is on friendly terms with the political leaders of many nations in those areas, especially of the important Middle East. The King is an avowed enemy of communism and I believe I will not betray His Majesty's confidence when I say that he believes the Russians are very vulnerable, especially in the Balkans, including Albania.

"The King is a warm and true friend of the United States. His Majesty's attitude toward this country reflects the views of his fellow countrymen. In the first place, the Albanian people, representing the oldest race in Southeastern Europe, throughout the ages have preserved their national instincts despite invading foreign armies and military occupation of long duration. Through all of their national tribulations the Albanians preserved their own language, their national customs, their love of freedom. They are a home-loving, hospitable people, they are ardent individualists, as we Americans are. Again the Albanian people are deeply grateful for the attitude of the late President Woodrow Wilson, who vigorously sponsored the full political integrity of Albania at the Peace Conference of Versailles, following the end of World War I.

"When the time came for his majesty King Zog to choose a queen, while I was serving the American Government in Albania, incidentally, he chose a very beautiful and charming lady, the Countess Geraldine Apponyi whose mother was an American, father Hungarian. From that union there is a son, the Crown Prince of Albania, now 12½ years old. He was born 2 days before Mussolini's Fascist Legions attacked Albania in April 1939. The Crown Prince today, King Zog told me proudly in Washington, is now taller than his father who is slightly above 6 feet. The King also informed me that he hopes to educate his son in the United States.

"The King's suite at one of the leading hotels in Washington was a busy place since he had many callers. Among his visitors were leading personalities from countries

of the Middle East and from other countries in Europe which are not now behind the Russian iron curtain. There were also prominent high American officials, who called on His Majesty. Among these American callers were two prominent Southerners who are nationally known. It was my privilege to be present when the King conferred with Representative JAMES P. RICHARDS, of the Fifth Congressional District of South Carolina. Mr. RICHARDS is chairman of the powerful House Foreign Affairs Committee. Mrs. Richards, a charming lady of an old southern family, accompanied her husband. Later it was my privilege to introduce to King Zog, Senator JOHN J. SPARKMAN of Alabama. Senator SPARKMAN is a prominent member of the Senate Foreign Relations Committee and delegate from Congress to the United Nations. The Alabama Senator was also a member of the small group of Senators of the Senate Foreign Relations Committee which recently made a tour of several European capitals, including Madrid. The purpose of the visit was to make an appraisal of United States defenses in Europe. The committee submitted a report to the Senate while I was in Washington.

"Albania, which is now blocked off from the Western World by the Russians, is a place of great strategic importance from a military standpoint. It is the western gateway to the whole Balkan area. Italy used Albania in 1939-40 as a jumping-off place against Greece. Albania is also important in the control of the Mediterranean because of its location on the Adriatic Sea near the entrance to the Mediterranean. May I suggest that you get out the map of your old geography and look up Albania. It is a small country but very important to the Western World in its struggle with the Communists. When I said goodbye to King Zog, yesterday, before leaving Washington, I invited His Majesty to visit this section of the old South, including Georgia, South Carolina, and Alabama. I urged him to come, saying I could assure him of a warm, hospitable, true southern welcome. His Majesty thanked me cordially and said he would be happy to accept, if not on this present visit, which is likely a short one, then at a later date when he hopes to return to the United States for a second visit."

"If Fighting Has To Be Done, the Basic Mission of MATS, a Major Command of the United States Air Force, Is To See That It Is Not Done in the Rubble of American Cities"—Gill Robb Wilson

EXTENSION OF REMARKS

OF

HON. FRANK W. BOYKIN

OF ALABAMA

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. BOYKIN. Mr. Speaker, Mr. Gill Robb Wilson, noted commentator and aviation feature writer for the New York Herald Tribune, recently published an article entitled "Military Air Transport System Called Lifeline of United States Forces."

I was particularly happy to read this splendid tribute paid to a major command of the United States Air Force—which has done so much distinguished service in helping our Ground Forces in Korea.

How many, many times—from my home and elsewhere in Mobile—I have seen the great C-54's, and other of our MATS planes take off from our own Brookley Field—and start on their flights to Tempelhof, Germany.

Recognizing the capacity of our strategic airpower to carry combat to the heart of the enemy countries—and the capacity of our tactical airpower to defend us against the invading bombers—in speaking of MATS, Mr. Gill Robb Wilson writes:

Rarely is the Military Air Transport System mentioned in a definitive capacity other than the flying of transports hither and yon. This is unfortunate since it foreshortens understanding of our capability in national security at a time when confidence is necessary.

This is a splendid observation made in recognition of a great segment of our splendid air service by one most capably equipped to make such observation and comments.

Mr. Speaker, there is so much of interest contained in this article that I ask the indulgence of my colleagues to insert the same in the record of this day's proceedings.

The article reads as follows:

THE AIR WORLD—MILITARY AIR TRANSPORT SYSTEM CALLED LIFELINE OF UNITED STATES FORCES

(By Gill Robb Wilson)

TRAVIS AIR FORCE BASE, CALIF.—Military air transport is the significant measure of a nation's ability to fight on its own terms and in places of its own choosing rather than on terms and choices dictated by an enemy. No single defense service can go further to keep war from American shores than can the Military Air Transport Service of the United States Defense Establishment.

This is accomplished through the mobility and flexibility conferred upon Army, Navy, and Air Force by the global pattern of weather information, radio communications, and crucial supply furnished through MATS.

Because of its activities in famed instances of air lift such as the Hump, the Berlin blockade, and the Korean war, MATS has come to be thought of more as a glorified aerial trucking company than as a means of national flexibility to keep war from the backs of the American people.

MEASURE OF CONFIDENCE

One hears of the capacity of strategic air power to carry combat to the heart of enemy country, and of the capacity of tactical air power to defend against invading enemy bombers. But rarely is MATS mentioned in a definitive capacity other than the flying of transports hither and yon. This is unfortunate since it foreshortens understanding of our capability in national security at a time when confidence is necessary.

Organizationally, MATS is a major command of the Air Force. It is manned by some 72,000 personnel, operates from 70 air bases along 70,000 miles of airways connecting 37 different countries. In charge of the air weather service, it collects weather data from some 1,100 points over the globe and disseminates the charted information to all friendly sources. MATS likewise maintains a global communications system, operates the far-flung network of American air rescue facilities, furnishes in-flight information to all aircraft, and supports an air resupply service and communications system.

All of this adds up to world-wide capability in support of American and Allied

forces. It means that the Army can fight in Korea without fear of running short of ammunition 7,000 miles from home. It means that the American mission in Turkey is in daily contact with the Pentagon Building. It means that a strategic air group can leave the United States and set up for business in Asia or Africa within hours. It means that a group of jet-fighters can ferry to Europe in hours rather than weeks.

SUPPORTS LAND ARMIES

In volume and tonnage, MATS does about 75 percent of its operational flying to support land armies. This is understandable since the numbers of personnel in armies are always more numerous than in navies or air forces. Yet it does not follow that support of armies is the priority mission. MATS priority is reserved for Strategic Air Command.

In 18 instances during the last year, MATS has been called upon to hustle some strategic air group to some distant area where its presence was considered of strategic, tactical, or diplomatic value. Such a project, if carried out with precision and smoothness, is one of the acid proofs of logistics. A strategic air group, composed of some 1,500 men and several tons of line maintenance equipment, can move perhaps a quarter of itself (flight crews and crew chiefs) in its own aircraft and be operational within the same 24-hour period against an enemy.

WHERE LUFTWAFFE FAILED

But if the group is to remain operational at its distant base, the remaining three-fourths of its personnel and maintenance tools also must quickly catch up. This is the function of MATS and any one who has been privileged to watch the fine timing and precise loading of such a movement has seen a stirring example of air logistics at its best.

During the Stalingrad campaign, the German Army commander notified Hitler that he could maintain his forces if provided with 300 tons of supplies daily. The Luftwaffe was given the task of providing airlift in that amount. The best the German Air Force could do was an average of 50 tons daily, and the German Army surrendered.

MATS is the guaranty that under similar circumstances American forces will not be helpless to win their campaigns in the backyards of the enemy. If fighting has to be done, MATS' basic mission is to see that it is not done in the rubble of American cities.

Partition of Ireland

EXTENSION OF REMARKS

OF

HON. GEORGE D. O'BRIEN

OF MICHIGAN

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. O'BRIEN of Michigan. Mr. Speaker, recently an editorial was published in the Irish Press concerning House Resolution 82, which was introduced by Congressman FOGARTY, of Rhode Island. The editorial presents a strong argument in favor of the passage of this resolution by the House when it comes before us for consideration. The resolution urges that a plebiscite be held throughout Ireland to determine whether the six counties in the northeast should remain separate from the rest of the country or not.

The question whether any given part of a nation should be permitted to secede

or separate itself from the rest of the nation is one for all the people of that nation to decide, as the editorial so clearly indicates. A minority group in any democracy is frequently required to subordinate its desires to the will of the majority, and so it should be in the case of Ireland.

The fact that Great Britain, our ally in two world wars, happens to be the nation responsible for the partitioning of Ireland against the wish of all the people of Ireland, and forced a separate government on the six-county area, which did not ask for it nor want it, should not deter this House from expressing its belief in democratic methods and principles. The editorial sets this forth with great vigor, and for that reason I am incorporating the text of the editorial in my remarks.

The editorial reads as follows:

AMERICA'S OPPORTUNITY

Some time next month the House of Representatives of the United States will have an opportunity of expressing itself on Ireland's right to unity and to sovereignty over all its territory. Thanks to their fidelity to principle, a majority of the Foreign Affairs Committee have passed the Fogarty resolution for discussion and decision by the House. The support given to the resolution by Congressmen will be a test for all true Democrats.

It is easy for an assembly like Congress to demand freedom for the victims of America's enemies. But here is a matter in which principle asks for courage as well. The wrongdoing of one of America's friends is in question. By now it ought to be clear that the covering up of betrayals of democratic principles lest an ally be embarrassed pays dividends only to an aggressor. Half of Europe is in subjection because men feared to speak against a cobelligerent. Ireland's case gives an opportunity to the representatives of freemen to abandon this evasion of their responsibilities.

British propaganda will provide some arguments for those who wish to dodge the issue. The old pretense will be put forward that the six-county area has the same democratic right to decide its destiny as the Irish Nation has. But no Congressman can accept that argument unless he is ready to concede to Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut or any other group of States the right to attach themselves to Canada whenever they disagree with a vote of the people of the United States. It will be said that Ireland, Britain, and the six counties were all consenting parties to partition. Ireland never was. By a succession of deceptions and threats, over which even Russia might pride herself, the British secured Irish signatures to agreements which were from the beginning falsely described. These agreements were disowned by the Irish people at the first free opportunity and no binding contract ever lay.

The argument that this is a domestic question for Britain is invalid from the word "go." It is no more a domestic question than the fate of Belgium was a domestic question for Germany in 1940. The issue is a little nation's right against an empire's power.

There is one piece of evidence, provided by the supporters of partition themselves, which answers all those who advance these arguments; that they will not consent to have this national issue decided by a national plebiscite. Their refusal to accept this, the one democratic solution, is an admission (a) that Ireland was dismembered against the opposition of the overwhelming majority of her own people, and (b) that

that dismemberment is being maintained despite an opposition which has never slackened and never lessened for the 31 years partition has lasted.

Members of the United States House of Representatives have no doubt whatever that a 20-percent minority in Czechoslovakia had no right to hand over the national territory or any part of it to the Russians, or that 20 percent of Poles had no right to decide the destiny of that nation. A 20 percent minority in Ireland is equally debarred from deciding the status of Ireland or the extent of Irish sovereignty.

Resolutions and Declarations Adopted by the Nineteenth General Congress of the General Society of Mayflower Descendants

EXTENSION OF REMARKS OF

HON. ROY O. WOODRUFF

OF MICHIGAN

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. WOODRUFF. Mr. Speaker, the General Society of Mayflower Descendants, at its nineteenth general congress, held at Plymouth, Mass., September 10-13, 1951, adopted certain resolutions and declarations, which, in their wise and sturdy Americanism, are what might have been expected of the descendants of the Pilgrims. The chairman of the committee on resolutions was our friend and former colleague, Hon. Maurice H. Thatcher, of Kentucky, and a delegate to the Congress from the District of Columbia. The other members of the committee were: Dr. Roger Shaw, of Trinity College, Hartford, Conn.; Mrs. Henry Bourne Joy, Michigan; Frederick Foster, Boston, Mass.; and Mrs. Robert McLure Fairleigh, Kentucky; with Standish Bradford, also of Boston, general counselor of the society, ex officio member.

The delegates at the congress—triennial in character—were more than double the number in any previous congress. Col. Walter M. Pratt, Massachusetts, governor general of the society, and Walter Lester Glenney, New Jersey, secretary general, were reelected.

There are about 40 State societies of *Mayflower* descendants, scattered through the country, with something like 8,000 members. The State societies—that in Virginia being the last one organized—are federated under the general society. Lineal descent from a passenger—or passengers—on the historic *Mayflower* in 1620 constitutes eligibility for membership.

Believing them to be of sufficient merit to entitle them to be given the widest dissemination, under leave accorded, there are included, as a part of these remarks the indicated:

RESOLUTIONS AND DECLARATIONS

The nineteenth congress of the General Society of Mayflower Descendants adopts the resolutions and declarations hereinafter set forth:

"We are profoundly grateful for the Pilgrim achievement and heritage; and on this spot, made forever sacred by the presence and labors of the Pilgrims, we would renew our pledges of allegiance to their memory and consecrate ourselves anew to the great faith and principles which motivated their lives, and which contributed so largely to the founding of the American civilization and the American Nation.

"Ever mindful of the best interests of our country; and because of the grave and unexampled perils which now threaten it; and believing that the problems of this day should be dealt with in the spirit and courage evinced by our Pilgrim ancestors in dealing with the trials and difficulties of their day; and with the thought, also, that the views and declarations herein set forth are fully just and appropriate and should receive the hearty approval of all loyal Americans: Be it

"Resolved, as follows:

"EDUCATION

"We reaffirm and reemphasize the resolution adopted by the eighteenth general congress registering the general society's unalterable opposition to, and condemnation of, the introduction of subversive ideas in American education, and urging the teaching of American history, geography, and government in a full and adequate manner.

"In this general connection we denounce and condemn the writings and utterances of subversive writers, and speakers, who, for evident sinister purposes, attack our American institutions and way of life, and strive to minimize and discredit the deeds and character of the men and women, who, in unprecedented peril and sacrifice, founded and preserved this, the last best hope of humanity, the United States of America.

"WORLD GOVERNMENT

"We condemn, as wholly impracticable, and as calculated to destroy the Constitution and self-government of the American people, the proposals embodied in the idea of world government.

"THE AMERICAN FLAG

"We oppose any effort to place above the American flag the flag or emblem of any other nation or political authority.

"INVESTIGATING COMMITTEES

"We commend the work of those congressional committees which have been, and now are, engaged, in sincere effort, in the investigation of subversive activities and agencies, and of crime; and, as to crime, we would urge that all official inquiries should fully include and comprehend offenses against the ballot.

"COMMUNISM

"We believe that no Communist can be a true American, and that no true American can be a Communist. We urge the elimination from every public place or authority of any person who may be duly shown to be pledged to the overthrow of our Government by force or violence, or otherwise disloyal and treasonable; and that only those be placed or kept on guard—whatever their race or origin—who are in spirit and practice loyal Americans.

"NATIONAL EXPENDITURES

"We express our gratitude to all those in Congress who are making earnest and continuing effort to bring about indispensable economy in our national expenditures, and relief to the overburdened American taxpayer; and we suggest that the State societies join the general society in giving full encouragement and support, in every proper manner, to the Members of the House and Senate who are striving to effect these results through the amendment of appropriate

tion bills, and by means of other appropriate processes.

"MORAL STANDARDS

"We truly believe that 'righteousness exalteth a nation'; and so believing, we deplore the lowering of moral standards and ideals, so prevalent in the public and private life of this day and generation; and we also believe that the time is ripe for reconsecration and rededication by the people of America to the great principles and integrities of the founders and preservers of the Republic."

Use of Influence in the Making of Loans by the Reconstruction Finance Corporation

EXTENSION OF REMARKS

OF

HON. MARGARET CHASE SMITH

OF MAINE

IN THE SENATE OF THE UNITED STATES

Wednesday, September 26, 1951

Mrs. SMITH of Maine. Mr. President, I ask unanimous consent to have printed in the Appendix of the Record the September 26, 1951, column written by David Lawrence.

There being no objection, the column was ordered to be printed in the Record, as follows:

"EVERYBODY'S DOING IT" DOCTRINE—GABRIELSON ABOUT TO BE OFFERED UP AS A POLITICAL SACRIFICE. RESIGNATION WON'T CLEANSE SITUATION IN RFC DEALINGS

(By David Lawrence)

A new code of ethics seems to be required for Republican national chairmen, though it is based on an entirely different set of circumstances than the case of Democratic National Chairman William Boyle.

Guy Gabrielson, head of the Republican national headquarters, happens to be president of a company which needed a loan from the Reconstruction Finance Corporation. So he naturally went about it directly without intermediaries. Now he is being accused of impropriety because the headlines tell how Mr. Boyle, the head of the Democratic headquarters, has been approaching the RFC by telephoning introductions to officials for his clients who sought loans.

It turns out that Mr. Boyle is being questioned by a Senate committee not only as to his own activities but as to whether he derived any financial benefit from the contacts which his law partner had made with the RFC after he became national chairman.

The two cases are entirely different but many Republican Senators are highly displeased with what Mr. Gabrielson did—mostly because it enables the Democrats to point the finger of blame in his direction. It thus tends to absolve—at least in the headlines—Mr. Boyle of any impropriety. For if everybody was doing it, the doctrine espoused in some quarters here is that this makes it all right.

Actually, as Senator TAFT—who doesn't agree with his colleagues about the matter—puts it, there is a vast difference between the Boyle and the Gabrielson cases. For one thing, as Representative CLAIRE HOFFMAN of Michigan, Republican, remarks facetiously, Mr. Gabrielson ought to resign for dumbness—that is, for thinking a Republican national chairman would have any influence or pull with the Democratic-controlled RFC.

But Senator WILLIAMS of Delaware, Republican, who has been emphatic in his expressions in the Senate disapproving what Mr. Gabrielson did, says that everyone knows that there may be a change some day in the political complexion of the administration here and the appointive power may shift to the next Republican administration. Then presumably a member of the RFC Board of Directors—this was before a single administrator had been appointed—might be worrying about what might happen when his own term expired in the middle of a Republican administration. Influence with a Republican Party chairman might come in handy. The theory is that the RFC members who pay any attention to politics at all would be just as likely to want to feather their nests by standing in with a Republican national chairman as with a Democratic.

Primarily, the Republicans who are crying out against Mr. Gabrielson are indignant that the revelation about his negotiation of a loan tended to take the edge off the juicy scandal headlines from which the Republicans in Congress were expected to benefit in connection with the Boyle case. Along came the case of the Republican national chairman to spoil their publicity. The public, indeed, carelessly bunches the two together.

Under the circumstances, whether Mr. Gabrielson really did anything wrong or improper has become secondary. He is about to be offered up as a sacrifice on the altar of political righteousness, and it isn't often that a Republican finds himself in a position to help the cause of his party by gracefully withdrawing from the picture on that score.

Mr. Gabrielson doubtless knows that, unfortunately, his resignation will not altogether cleanse the situation. For, if the truth were known, national committeemen of both parties are pretty influential citizens in their respective States and while it may be that not any of the others had dealings with the RFC, it is also possible that some of them are lawyers who practice before Government departments. Pretty soon all these investigations are going to take the joy out of life for the practical politician—and maybe, in a wave of curiosity as to what really constitutes ethics, the spotlight will be turned on all the Members of Congress and members of the State legislatures whose law offices or law partners at home receive legal fees from corporations and labor unions and other interests which have legislative matters up with Federal and State Governments.

Answering Time Magazine's Vicious Attack on Congress for Aiding Disabled Veterans

REMARKS

OF

HON. JOHN E. RANKIN

OF MISSISSIPPI

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. RANKIN. Mr. Speaker, it would have been in order for me to rise to a question of personal privilege, or to the privilege of the House, to answer the vicious attack on me and other Members of Congress made by Time magazine on August 27.

If this were merely a personal attack on me, I do not think I would take up the time of the House to even refer to it.

But since it was a malicious smear of an overwhelming majority of the membership of both Houses of Congress for doing their duty as they saw it toward a small group of hopelessly disabled veterans, I feel that it is my duty, as a Member of the House and chairman of the Committee on Veterans' Affairs, to give the country the real facts in the case.

In addition to its malicious attack on me, in which it published a distorted picture of your humble servant, this article attacks the Members who voted to override the President's veto of a bill to take care of a small number of old veterans who are either blind or so hopelessly disabled that they have to have an attendant, and brands the Members who so voted as "liars and hypocrites."

That epithet applies, of course, to Members of both Houses of Congress, since the bill was passed over the veto in both Houses by a majority of more than 7 to 1—318 to 45 in the House and 69 to 9 in the other body.

The measure merely gives to these old, hopelessly disabled veterans, who are either blind or so helpless that they have to have an attendant, the same compensation that is provided for veterans of the Civil War, veterans of the Indian wars, and veterans of the Spanish-American War.

The only difference is that there is an income limitation on these veterans that does not apply to the others, and there is also a restriction barring the ones who are suffering from their own misconduct, which does not apply to the veterans of the Civil War, the Spanish-American War, or the Indian wars.

Mr. Speaker, I have no apology for the efforts that I have made to take care of our disabled veterans. I can simply say that I, as chairman of the Veterans' Committee, have done my best to take care of them in a reasonable way. So far as I am concerned, I will never submit to seeing these helpless old men, who honorably served their country in times of war, seek the shelter of a poorhouse, or their widows and orphans begging bread from door to door, especially while our Government is giving billions of dollars to foreign countries, and subsidizing Time and Life magazines, as it did last year to the extent of \$137,200, to carry such vicious propaganda to the peoples of foreign countries.

I am reliably informed that Henry Luce, who owns both Time and Life magazines, drew a subsidy of \$137,200 last year for distributing these magazines in foreign countries. That money came out of the pockets of the overburdened taxpayers of the United States, including these disabled veterans, which the bill in question is designed to help, and for the support of which Time branded the Members of the two Houses of Congress who voted to override the veto, as "liars and hypocrites."

I trust the proper committee of Congress will investigate this proposition and put a stop to this wasting the money of American taxpayers in this way.

The SPEAKER. The time of the gentleman from Mississippi has expired.

Bigness in Defense

EXTENSION OF REMARKS OF

HON. THOMAS B. CURTIS

OF MISSOURI

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. CURTIS. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following editorial from the St. Louis Post-Dispatch of September 24, 1951.

This editorial seems very timely, in view of the fact that roughly 2 months have passed since the Small Defense Plants Administration was created under the terms of the Defense Production Act amendment. Not one word has been heard concerning the appointment of the Administrator to head this important agency. Is it any wonder that some small-business men are beginning to express their doubts as to whether any benefits can be expected from SDPA and the concentration of defense contracts in the hands of very large business continues?

BIGNESS IN DEFENSE

From the beginning of the defense program it has been clear that the awarding of billions of dollars in armament contracts might help big business grow bigger while small business starved. Despite all the warnings and the clamor calls to protect small business, exactly this appears to have happened.

A report of the Senate Small Business Committee shows that 40 percent of the prime defense contracts awarded in the first year after the invasion of Korea went to only 10 manufacturers. The same report shows that nearly two-thirds of defense contracts have been awarded to 50 of the giants.

As the committee said, this record reveals "a considerably higher concentration of defense contracts than during World War II, when 10 large manufacturing companies controlled 30 percent of the war contract dollar volume and 100 companies controlled two-thirds."

Congressional policy is clearly against the undue concentration of defense contracts. So are the official statements of Defense Department policy. In a directive issued last winter, then Secretary of Defense Marshall called for "broadening the industrial base of procurement programs," and instructed that "the concentration of contracts with a few leader suppliers is to be avoided unless the necessity therefor is clear."

Despite these repeated statements of policy, big business evidently continues to get the lion's share of the defense contracts. That big business must get a big share is understandable, since many of the defense contracts are of such a magnitude as to rule out smaller firms. But when 10 firms get 40 percent of all contracts, when 20 firms get 50 percent, when 50 firms get 64 percent, it is time to ask whether the procurement officers are faithfully carrying out their explicit orders.

John D. Small, chairman of the Munitions Board, told a Senate subcommittee that small business received 22.5 percent of all defense contracts during the first 10 months after the invasion of Korea, and that this proportion has risen in recent months. Let us hope that this trend, if it is a trend, will continue.

Nevertheless the Senate Small Business Committee reports that "the top 50 concerns have received many contracts for which there

were alternative sources of supply equally competent to perform the work satisfactorily."

It declares that many of the giants refuse to subcontract to smaller producers, but "hoard" their contracts even though their own backlog of unfilled orders is piling up.

It warns that "the trend of concentration of defense contracts must be immediately reversed if a top-heavy imbalance is not to undermine our economy, retard our mobilization effort, and entrench monopoly beyond hope of dislodgement in our time."

Will defense officials heed this warning? Or will they go on paying lip service to the principle while violating it in practice?

Grim Pointer

EXTENSION OF REMARKS OF

HON. MYRON V. GEORGE

OF KANSAS

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. GEORGE. Mr. Speaker, under leave to extend my remarks, I wish to submit an editorial from the Winfield Daily Courier, Winfield, Kans. This is in connection with the recent flood in Kansas as it is affecting some industries. It follows:

GRIM POINTER

Last Saturday the grim conditions in Kansas flood areas were pointed up by the announcement that the Morrell packing plant at Topeka would not be reopened. It would cost too much, the company said, for rehabilitation.

In consequence, approximately 1,200 employees of the plant will receive severance pay. They will then be out of work and will have to find new employment.

If a large packing company feels unable to rehabilitate a plant in the Kaw Valley, what must be the condition of many smaller firms and individuals? The answer can only be that in many instances the conditions are desperate.

Only those who have seen the havoc in such towns as Marion, Florence, Manhattan, Argentine, Armourdale, and others can have any idea of what has taken place. In some instances destruction was so complete surveys may be needed to establish property lines.

Because of the situation in these Kansas towns and communities Winfield people should be responsive to these pleas for aid. The local veterans' organizations are gathering relief goods and the response here should be good. The response should be especially good here as Winfield knows only too well of the horrors of a flood.

District of Columbia Chapter of the American Marketing Association Honors Government Personnel for Outstanding Work in the Field of Marketing

EXTENSION OF REMARKS OF

HON. CLIFFORD R. HOPE

OF KANSAS

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. HOPE. Mr. Speaker, last evening I had the pleasure of attending the first

annual awards dinner of the District of Columbia chapter of the American Marketing Association. At that meeting awards were presented to the following for their work and research on certain phases of marketing:

Earl W. Carlsen and Donald R. Stokes: Prepacking apples at point of production.

George H. Goldsborough: Coordinating the marketing of Florida citrus fruit.

William C. Truppner: Procedures for defining census areas in tracted cities for presentation of retail trade and other data.

C. J. Otten, assisted by A. L. Owen, N. G. Paulhus, S. D. Clark, and A. B. Lowstuter: The wholesale produce markets at Boston, Mass.

The program chairman was Paul H. Bolton, vice president of the District of Columbia chapter of the American Marketing Association, and vice president of the National Association of Wholesalers.

The toastmaster was Cyrus S. Kauffmann, president of the District of Columbia chapter of the American Marketing Association.

The awards presentation was made by Floyd Hosking, chairman of the awards committee, and vice president of the Corn Industries Research Foundation.

The guest speaker was the Honorable Charles F. Brannan, Secretary of Agriculture, who delivered a significant address on the subject, Agriculture Looks To Marketing Research. I know of no subject which has aroused greater interest in Congress than marketing research, and I am sure that Secretary Brannan's splendid address on this subject will be read with interest by many Members of Congress. Under leave to extend my remarks in the RECORD, I include the same herewith.

I am sure, also, that the remarks of Mr. Hosking in presenting the awards can be read with interest and profit by all Members of Congress, and I am including them also as a part of my remarks.

It will be of interest to Members of Congress that three of the four awards made on this occasion were based upon work done under the Research and Marketing Act of 1946.

I want to take this occasion to commend the District of Columbia chapter of the American Marketing Association for initiating this awards program. As time goes on I am sure that it will result in great interest and even more significant contributions in the field of marketing research.

AGRICULTURE LOOKS TO MARKETING RESEARCH
(Talk by Secretary of Agriculture Charles F. Brannan at meeting of Washington, D. C., chapter of American Marketing Association, Tuesday, September 25, 1951)

I am very happy to be with you this evening at this meeting of the Washington chapter of the American Marketing Association.

It is with a great deal of pleasure and satisfaction that I note your program includes as its feature event a matter that is very near and dear to my heart. I'm referring to the fact that there will be a presentation of awards recognizing outstanding research in marketing performed by Federal agencies.

I can assure you that this strikes me as a most refreshing note in a public atmosphere

wherein the customary gesture toward those in public service seems to consist of nothing but avalanches of criticism and ridicule. It is essential, of course, that a democracy keep its government workers exposed to public scrutiny, even when that results in unwarranted ridicule. But just the same, a pat on the back for Government workers received from their contemporaries outside the Government goes a long way to make a job more pleasant and to offset some of the unwarranted criticism.

I believe that this action on your part emphasizes the degree to which our interests in marketing work coincide. In speaking of "our" interests, I mean the interests of the American Marketing Association and the Department of Agriculture.

Basically, we feel that we have a good, sound marketing system. It is a system that has helped to bring about the highest level of agricultural and industrial productivity the world has ever seen. It has helped to raise the Nation's useful employment, and in so doing has helped to raise the Nation's standard of living to its present pinnacle of progress.

We do not seek to revolutionize this system that has demonstrated its sound character. Rather, as a basic aim, we seek to improve and preserve the system we now have.

This basic aim with respect to marketing is entirely consistent with the Department's basic aim with respect to farming. That is, we are seeking to strengthen and preserve the family farm enterprise as the backbone of American agriculture. In both areas—marketing and farming—we seek to reduce costs, increase efficiency, and promote constructive competition.

To illustrate this, I want to relate a bit of the story of how the Department of Agriculture grew into its present marketing activities.

From its very beginning the Department of Agriculture has been concerned with marketing. The first congressional appropriation for agricultural work in 1839 authorized the Commissioner of Patents to expend the sum of \$1,000 for the collection of agricultural statistics and for other agricultural purposes. Facts and figures on production and supplies of agricultural products are as important in the marketing as in the production of farm produce. The original authorization was continued and included in the first legislation establishing the Department of Agriculture as a separate entity in 1862.

Through the years since the establishment of the Department, however, the great preponderance of interest and research in the Department has been directed toward farm production problems. That holds true even today.

But there has always been recognition of the fact that the production job was not completed on the farm—that farm produce had to be taken to the consumer before the job was complete.

Several factors tended to prevent the Department from directing major attention to marketing problems. One was the multiplicity of production problems awaiting attention. Another was the rather strong feeling in many quarters that the Department had no right to concern itself with problems beyond the farm.

As farmers and their customers drew farther apart and the marketing of agricultural products became more specialized and complex, the Department did receive additional assignments relating to marketing. Many of these had to do with regulatory matters assuring the public of sanitary and health protection, or assuring farmers of fair trading practices in the market places that grew larger and became farther removed from the farm. Others had to do with service problems, such as the dissemination of market

news and the promulgation of grades and standards for trading farm products.

As time went on more and more of the research and extension functions of the Department inevitably involved marketing developments, as illustrated by the farm cooperative movement. This concern was also extended to the quality of products, which I think is well illustrated by an experience described by Dr. P. V. Cardon, the present head of the Agricultural Research Administration, who is here with us tonight.

As I understand the story, he walked out of the main building of the Bureau of Plant Industry a few years ago and observed a wreck along the Baltimore Pike. Going to the scene, he noticed that a large trailer truck had overturned and some of its contents spilled out on the road. The contents were peaches.

He thought he noted something familiar about those peaches. On close inspection he found that they were baskets of a new and improved variety that had been developed by the Bureau. But the peaches lying on the road were green, solid, and unattractive. They had not been allowed to mature. They had none of the merits and virtues that were promised by the new variety. The long and arduous work of the plant breeders had been worthless if these peaches were to reach the market in this condition.

Dr. Cardon was impressed by the fact that further work had to be done if the consumers were to get the benefit of the investments that had been made in developing the desirable attributes inherent in those peaches.

Farmers, with the help of science, have striven to raise the quality and uniformity of their products to supply the huge urban population that has grown in this country. Through plant and animal breeding, through fertilization and cultural practices, through improved harvesting methods, and with constant vigilance to protect the produce until it was delivered to market, they have tried to provide what they believed consumers wanted.

But all too often the quality was lost in long and devious marketing channels or reduced costs on the farm were absorbed in the marketing system before they could be passed on to consumers. Developments of this nature, observed many times in many places, finally overcame the highly controversial objections to agricultural scientists dealing with agricultural marketing problems. The Department, however, did not quickly acquire funds for this type of work. It was the Research and Marketing Act of 1946 which resolved the issue by authorizing and directing the Department of Agriculture to do marketing research, service, and educational work. At this point I would like to acknowledge the courage and foresight of the several Congressmen with us this evening who exercised commendable leadership in making this possible.

The first appropriation for these new, specialized marketing activities was made available in September 1947, just 4 years ago. Today we are able to see some of the results of this program of activity.

As the Department approached the job of launching a new marketing research and service program intended to provide benefits for marketing comparable with the notable achievements that had been attained for farm production, it was impressed with the magnitude, the scope, the variety, and the complexity of the problems involved. There was no clear-cut definition of marketing. Indeed, we do not have a completely satisfactory one yet.

One reason for this is that the marketing job in agriculture tends to be somewhat different from that of industry. If we interpret marketing to mean all the activities and services performed with farm production be-

yond the farm gate, it encompasses processing, storage, packaging, and other functions frequently classified as production functions by industrial plants. In addition, it includes the assembling, transporting, distributing, and pricing functions that are universally accepted as aspects of marketing.

In view of this situation, I feel it is appropriate to indicate briefly the several categories of work that are being conducted under the new marketing legislation as a means of showing how the Department has interpreted what constitutes marketing work for agricultural products.

On the theory that effective marketing in a competitive system requires full knowledge on the part of both buyers and sellers, a substantial share of the program is devoted to increasing the information available to participants in the market. Among the activities directed toward this end are the assembly and dissemination of reliable facts on supplies, stocks, movements, locations, disappearance and prices of products, the preparation of current market news on receipts, deliveries, and quotations at the principal market points, and the conduct of consumer education on what is in season, how to judge quality and how to use the products.

Another phase of the work is oriented about the products that move through the marketing system. It is largely directed toward maintaining or improving the quality of the products as they move from the farms to consumers. It seeks to reduce waste and spoilage of products, which we find are very costly items in marketing margins. It seeks also to minimize quality deterioration as a means of increasing consumer satisfaction and benefits by way of more highly nutritional diets.

Here are some examples of our work to improve quality which were made possible by the Research and Marketing Act. A new type of crate for shipping lettuce and carrots keeps these products in better condition from farm to market. And the new crate permits 18 refrigerator cars to haul what formerly required 17. Arizona and California growers are now using the new crate, and savings in crate breakage alone is estimated at \$300,000 a year.

The use of recently developed electrical equipment for loading out delivery trucks from wholesale stores and warehouses permits two men to do the work of three.

Department researchers have worked out a low-cost mechanical method for dumping field crates of apples which reduces bruising as much as 60 to 70 percent. They have also found that food distributors can reduce the handling costs of fruits and vegetables by 20 to 80 percent through more efficient use of their hand trucks, skids, pallets, and other equipment.

A rather surprising recent discovery is that a lot more ice than necessary is used in shipping lettuce. Western shippers can save about \$440,000 a year by using 10 pounds less ice per crate and still get the product to market in better condition.

Grades and standards have been developed and improved to more accurately identify quality and thereby expedite the trading of farm products. Improved standards also enable the market to reflect quality premiums back to the producers. We cannot expect farmers to strive harder for higher quality production unless they are compensated for their efforts.

Another part of the program is directed toward improving the market place itself. More than 60 different cities in producing areas have requested the Department's aid in studying the adequacy of their market facilities and recommending plans for improvements of such facilities which will reduce their cost of operation and deliver

the products in better condition to the consumers.

Detailed studies have been made in some 35 localities, and new wholesale market facilities have been built or are in the process of construction in 15 of these places. The inadequacy of many of the wholesale produce markets of the country has been the subject of five Federal investigations over a period of 40 years. The Agricultural Marketing Act of 1946 instructed the Department to work with the localities that need improved facilities and help them to determine the specific nature of the facilities needed in each place. This was the first organized effort to do anything about this problem, although the problem has been widely recognized ever since World War I.

In cooperation with food retailers, our specialists working under the marketing research program have developed an improved check-out counter which increases the productivity of the checker in a retail self-service food store by some 38 percent, thus effecting a considerable reduction in the cost of performing the check-out operation, speeding up the flow of people through the check-out counters, reducing the congestion in the store, and increasing the efficiency of the parking lot. Within less than 6 months after the report on this study had been released, these counters had been installed in more than 1,000 retail food stores.

In a sense all of the work conducted under the Agricultural Marketing Act has as its ultimate goal the reduction of marketing costs through increased operational efficiency. Most of the work I have been describing might be classified as indirect approaches to this goal. Some work goes more directly to the problem by studying the costs and margins themselves. This includes the measurement and comparison of them from place to place, from time to time, or from firm to firm. The analysis of these measurements helps businessmen to identify the points of inefficiency in their operations so that they can be corrected. Such analysis also helps the research workers to direct their efforts to the places where they can do the most good in assisting business operators.

As our research has provided a greater insight into agricultural marketing, I have been struck with the similarity of problems confronting farm and market enterprises.

For example, the hundreds of thousands of retailers selling farm products, like the millions of farmers producing them, are essentially small enterprisers who are completely occupied with their business operations. They have neither the time nor the opportunity to conduct their own research or to keep abreast of research results appearing in technical publications. But when research shows how they can operate more efficiently and the results are brought to them through practical demonstrations, they are quick to adopt new ways.

Likewise, the numerous urban fresh produce dealers cannot individually plan and construct modern facilities. They need the help of experts to make the blueprints and organize the tremendous undertakings necessary. This help can be furnished by agencies dedicated to public service because the benefits derived from aiding these dealers to establish more satisfactory, less costly markets are shared by the producers and consumers as well as the tradesmen themselves.

It has not been my intention to suggest or imply that we in the Department of Agriculture regard ourselves as being pioneers or as being unique in our interest and activities in marketing research. With the recent growth of our marketing work, however, we have felt an increased sense of mutual interest between us and the American Marketing Association and the Wide-

spread institutions and organizations represented in the association membership.

I am gratified to note that members of the Department participate actively in the affairs of the association, both in the Washington chapter and in the national association. This evidence of professional standing and professional association of the staff members increases my confidence in their ability to do marketing work objectively and competently. It is also a source of gratification to me to note the prominent parts played in our association by officers who have in the past been members of the Department's staff.

I want to express my appreciation once more for the refreshing, constructive approach you have taken toward the research work carried on by Federal agencies. The awards you present are a very healthy gesture that reflects credit on your organization and its members.

In conclusion, I want to state my conviction that the results appearing from marketing research indicate that science can do for marketing as much as it has done for agricultural production.

REMARKS BY FLOYD J. HOSKING, CHAIRMAN, COMMITTEE ON AWARDS TO GOVERNMENT AGENCIES, BEFORE THE WASHINGTON CHAPTER OF THE AMERICAN MARKETING ASSOCIATION, SEPTEMBER 25, 1951

Distinguished and honored guests, fellow chapter members, ladies and gentlemen:

Mr. Kauffman's introduction reminds me of a bill I received not long ago from a prominent Washington physician. When paying it I scribbled across it in a large, bold hand, "Inflation isn't coming, it's already here."

President Kauffman, your kind remarks about the work of the Committee on Awards to Government Agencies makes me feel I am one of you. I can hardly wait to hear what I am going to say.

Before commenting on the award program, I want you to know that the man who should be up here tonight is George Travis, the chapter's 1950 president. He will not be here this evening because his association is having its annual convention—it's the old story that work comes before pleasure. It was under his guidance—his direction—that the award program was planned, developed, and executed. His policy was abetted by the American Marketing Association's vice president, Dr. White of the United States Department of Commerce. When George asked me if I would help him by accepting the chairmanship of the committee I accepted gladly. I was then, and still am, impressed with the potential benefits such a program can bring, not necessarily to this chapter—that's incidental—but primarily to the personnel in Government service who have struggled through a long research study.

The Washington chapter through its awards program has taken on the worthwhile obligation to arouse greater interest and appreciation on the part of those interested in marketing, to recognize and promote outstanding research, and to foster higher levels of achievement in the field of distribution.

I am not going to make the claim that too few compliments are given by top Government executives to their scientists and specialists who doggedly, day after day, pour out their hearts, and in many cases their health, on assigned projects. Regardless, more recognition will not hurt. Efforts of businessmen are rewarded by profits; efforts of Government researchers by the knowledge of progress and achievement that has been brought about by their work. Tonight this chapter wants to show its gratitude to Government personnel whose work in 1950 has been found to be of outstanding quality.

Such a program is akin to the boss putting his arm around a worker's shoulders, to a complimentary slap on the back, or to a chief's remark, "A job well done."

Mr. Kauffman, as chairman of the Committee on Awards to Government Agencies, I wish to present to you, to the chapter, and to the award winners, the findings of the full committee. Because there are many guests here this evening, may I name the members of the committee.

Raoul Blumberg, advertising manager, Washington Post.

Stanley F. Cohen, Washington editor of Advertising Age.

Daniel M. Koplik, American Public Relations Association.

Robert R. Nathan, lawyer and economist, and president of Robert R. Nathan Associates.

Meryl Sullivan, National Canners' Association.

You will note that no Government personnel were on the committee, although several members of it have worked for the Government at one time or another.

I am not going to bore you with the details of the committee's work, except to point out several salient features.

1. Every Government agency in Washington, D. C., was informed of the program.

2. Twenty-six entries were received from six Government departments, including the United States Department of Agriculture, United States Department of Commerce, United States Department of the Interior, Interstate Commerce Commission, Federal Deposit Insurance Corporation, and Economic Cooperation Administration.

More papers were received from the United States Department of Agriculture than from any other Government agency. While this reflects the success of the work financed under the Research and Marketing Act, it is also the result of extra efforts by USDA personnel, especially by Mr. Roy Lennartson and others.

3. A number of Government department heads wrote letters advising the committee that no work in marketing or market research which met the criteria or standards established by the committee would be submitted, including Department of Defense, United States Tariff Commission, Department of the Air Force, Federal Communications Commission, National Labor Relations Board, United States Treasury Department, Federal Power Commission, Department of the Navy, Reconstruction Finance Corporation, Library of Congress, and General Services Administration.

4. The tremendous job of reading and evaluating the individual papers was sandwiched in with our daily work. Some of the papers were carried in brief cases all over the United States. For example, three papers were read in San Francisco, and several others in New Orleans, Miami, and Chicago.

5. The committee concluded that many of the papers were of outstanding merit, four particularly. The titles of these four, together with the names of the authors, are listed in the program which was placed by your plate. All of these papers were so good, the committee recommended to Mr. Travis and Mr. Kauffman that one paper receive first prize and the others honorable mention.

Let's examine the list. You will observe that three of the winning papers were prepared in the United States Department of Agriculture, and one in the United States Department of Commerce. Two deal with specific commodities (oranges and apples), one with a market or market function, and the other with an aspect of market research. One paper was prepared by a group of researchers, two men wrote another, and the other two were one-man jobs.

Now, by prior arrangement, we have all the award recipients at this long table be-

fore me. Referring to your program, we will name the authors and papers in order. The first on the list is: Earl Carlsen and Donald R. Stokes, *Prepackaging Apples at Point of Production*. Will Mr. Carlsen stand?

Mr. Earl W. Carlsen, a graduate of the University of Minnesota, is director of research of the Washington State Apple Advertising Commission, Yakima, Wash. We are honored that you traveled thousands of miles to be here with us tonight. Will Mr. Stokes stand? The coauthor, Mr. Donald R. Stokes, who majored in economics and horticulture at Michigan State University, is marketing research analyst of the Production and Marketing Administration, United States Department of Agriculture. Their study, authorized by the Research and Marketing Act of 1946, was carried on during the 1949 and 1950 apple-shipping seasons under a contract between the Washington State Apple Advertising Commission and the United States Department of Agriculture. Under the supervision of the Production and Marketing Administration and in close cooperation with local industry and marketing agencies, the work uncovered numerous ways of reducing costs of materials, through the development of several new packaging techniques, and demonstrated savings in merchandising. A market survey revealed that it was relatively more profitable for store operators to retail prepackaged apples than bulk apples because of greater sales, lower costs, and lower average spoilage and markdown losses. It is a pleasure to give each of you, for the excellence of your paper, the award of honorable mention. Thank you, Mr. Carlsen and Mr. Stokes.

The second paper on the list, *Coordinating the Marketing of Florida Citrus Fruit*, was prepared by George H. Goldsborough. Will Mr. Goldsborough stand? His paper was also conducted with funds provided by the Research and Marketing Act. When this study was written, Mr. Goldsborough, educated at Cornell University and the University of Maryland, was an agricultural economist in the Farm Credit Administration, now he is employed by the Sugar Branch, Production and Marketing Administration. The project was designed to help the then sick Florida citrus industry evaluate cooperative action in building an industry-wide marketing organization and program. His study, among other things, recommended that a central association for the Florida citrus industry be established to negotiate contract terms with processors in the interests of growers of fruit marketed for processing. The study made a significant contribution to the Florida citrus-marketing problem. It also includes analyses of considerable value to other agricultural industries which are trying to solve their price and marketing problems through joint effort. The committee takes pleasure in extending to you, for your significant contribution in the field of marketing, an honorable-mention award. Thank you, Mr. Goldsborough.

The third item on the list before you is William C. Truppner, *Procedures for Defining Census Areas in Tracted Cities for Presentation of Retail Trade and Other Data*. Mr. Truppner is out of the city on defense work and Mr. Harvey Kallin will accept his award. Will you stand, Mr. Kallin? Mr. Truppner's document provided the criteria, as well as the mechanism, for defining areas within our large cities which would be helpful in developing comparability of marketing data. In doing his work, Mr. Truppner and the Bureau of the Census worked closely with the census advisory committee of the American Marketing Association.

On the basis of Mr. Truppner's work, census community areas or retail trade areas have been established and provided for more than 20 major cities or metropolitan areas.

of the United States from Boston to Honolulu and Minneapolis to Miami. The 1948 Census of Business data have been tabulated for areas in a number of these cities. This project was undertaken and completed under Mr. Truppner's direction when he was chief of the business division of the Bureau of Census. At present Mr. Truppner is with the National Production Authority. For his contribution we are happy to present him, through you, Mr. Kallin, an award of honorable mention. Thank you, Mr. Kallin.

The last of the four studies on your list, The Wholesale Produce Markets at Boston, Mass., was done largely by C. J. Otten, but on various phases of the work he had assistance from A. L. Owen, N. G. Paulhus, S. D. Clark, and A. B. Lowstruter. Will Mr. Otten and his collaborators stand?

Since 1917 there have been five Federal investigations into the inefficiencies of wholesale produce markets, two by the Federal Trade Commission and three by the United States Congress. As a result, the United States Department of Agriculture was directed in 1946 to make studies of wholesale produce markets throughout the country. At the request of the wholesale trade organizations and city and State officials, a study was made of the wholesale produce market of Boston.

Mr. Otten's study revealed the existence of wasteful handling methods in the Boston market due largely to the fact that no concerted action has been taken over the years to keep the market facilities abreast with the city's growth and changing distribution patterns. Let me spend a minute here describing the market. The principal district is the old Faneuil Hall area which has been in existence since the days of Paul Revere. Stores in this area do not have rail connections, streets were congested, buildings were too small and not properly designed for the handling of perishable foods. As Boston grew it became impossible to transact all wholesale produce business in the Faneuil Hall area. However, instead of providing complete facilities in another location, an attempt was made to remedy the situation by having the railroads build facilities for handling produce in several parts of the city. Separate facilities were established in Cambridge to handle produce brought in by farmers. This approach to the problem of congestion resulted in breaking up the total wholesale market in such a manner that retail grocers and other buyers could not obtain a complete line of produce at any one of the locations. Cross-hauling was tremendous, cartage costs were high, and much produce deteriorated in the marketing process.

Mr. Otten's study of this market revealed the magnitude of these defects. He and his staff proposed as a solution the consolidation of the wholesale business into one new perishable-produce market area. The facilities proposed included 450 wholesale store units, covered stalls for 100 farmers and truckers, direct rail connections to all wholesale stores with additional tracks with unloading facilities for nearly 1,000 cars at one time, parking space to handle 2,250 trucks at one time, wide streets, and ample room for expansion. A specific site consisting of 170 acres was recommended at the intersection of two super highways which would give ready access to all parts of the metropolitan area. And here's the astounding finding: The total cost of these facilities could be paid from the annual savings of the new facilities compared with the old in less than 4 years.

Since this report was made the necessary legislation has been enacted by the State of Massachusetts creating a public benefit corporation with authority to buy the land,

construct the facilities, and lease them to the members of the trade.

Mr. Otten, it is with great pleasure that the Committee of the Washington Chapter of the American Marketing Association award you first prize for this outstanding work.

Mr. Kauffman, this completes the work of your committee.

Know Your Waterways—Competition and Interdependency

EXTENSION OF REMARKS

OF

HON. HENRY D. LARCADE, JR.

OF LOUISIANA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. LARCADE. Mr. Speaker, under unanimous consent, I am extending my remarks in the Appendix of the RECORD to include an article from the Washington Post, published recently by the Marine News of New York, N. Y., as follows:

KNOW YOUR WATERWAYS—COMPETITION AND INTERDEPENDENCY

When the Federal Barge Line was established on the Mississippi River system in 1924, former President Markham, of the Illinois Central Railroad stated that, "The Illinois Central, of course, recognizes that the barge line offers competition paralleling it on the Mississippi River, but our interests are clearly identified with the interests of the people of the Mississippi Valley . . . if it is a good thing for the people of the Mississippi Valley, it in some way will probably operate as a good thing for the Illinois Central system. If it supplies additional transportation that is needed and may be needed in the future that we cannot supply, or if it supplies a cheaper transportation than we can supply and makes for prosperity of the people in that section of the country where our own interests are bound up, it in some way may work back to our own selfish interests. Perhaps it will increase the population, increase the amount of business everybody does down in that territory. If it does operate in that way we are going to reap some benefit, too."

Localities served by two or more methods of transportation pay rates determined by competition to the great benefit of consumers. While purchasers may pay the same price for commodities or tonnage however delivered, they would pay a higher price if their communities were served by only one system of transportation. Railways are among the largest users and beneficiaries of harbors and channels, and there is much vital interdependence between water and rail transportation.

Arizona Exposes Her Own Scheme

EXTENSION OF REMARKS

OF

HON. NORRIS POULSON

OF CALIFORNIA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 18, 1951

Mr. POULSON. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following editorial from

the Los Angeles Mirror of September 22, 1951:

ARIZONA EXPOSES HER OWN SCHEME

Arizona has just pulled the rug from under her own phony arguments for the central Arizona project.

This State-wide tumble is a classic case of double talk backfiring. For years Arizona Congressmen have sought support for their preposterously impractical irrigation scheme by weeping into the CONGRESSIONAL RECORD over their allegedly desperate water situation.

Recently a national picture magazine, impressed by their tears, sent a team of photographers to Arizona. They ran five pages of pictures echoing the Arizona claims of a parched and wasted land.

Then what d'you think happened?

Arizona's biggest bankers and newspapers rose up en masse and denounced the pictures as faked and the story of drought as a complete exaggeration. All of which makes Arizona's Congressmen, who said the same thing, look like a pack of liars.

Read what Arizona's big boys had to say: "Arizona has a troublesome water situation," the Arizona Republic reported, "but not nearly as bad as painted by Life magazine."

"That was the view taken Tuesday by Phoenix business and civic leaders, every one of whom attacked Life for what they termed gross overemphasis of the State's drought conditions."

The newspaper quoted Walter R. Bomson, bank president, as stating that the general condition of the range is better than in previous years, with cattle being shipped in from outside the State to eat surplus feed.

(This doesn't square with the statement of Congressman PATTEN, recently quoted as saying, "Arizona desperately requires her share of the river waters now, to preserve her way of life.")

The real icing on the cake, however, came in the Republic's Our Amazing Arizona column, which said that the greed of Arizona's own ranchers was the root cause of Arizona's water troubles.

"Before a law curbing (excessive drilling) could become operative, human greed asserted itself and well-drilling went on around the clock," the columnist wrote. "Pumps sucked at the diminishing underground supply to irrigate old and new agricultural lands. It has been—and still is—a mad scramble for the quick buck which can be garnered for subsidized agricultural products."

There you have the real story. The truth will come out—even out of Arizona.

Now, even Arizona admits that it is Arizona water hogs, wastefully driving new wells beyond the limit of prudence, who have depleted the normal water table. By their own admission, the State's No. 1 resource has been squandered in a mad effort to make the most of Government crop subsidies.

But even on top of that, a leading State banker says things aren't so bad, with the ranges in better shape than in previous years.

In the face of these facts, Arizona has had the colossal gall to ask the United States taxpayers to spend \$1,000,000,000 to bring water to 240,000 acres at a cost of \$2,000 an acre, so the water hogs can continue to milk the United States Treasury.

It is small wonder that the bald-faced duplicity of this attempted Treasury raid has caused a reaction in Congress which moved Congressman Abe Murdock hastily to abandon plans to seek approval of the irrigation project.

Seldom has the truth so completely exposed a nonsensical scheme as the unguarded reaction of leading Arizonians to the "drought" picture story.

The Great Quabbin Reservoir**EXTENSION OF REMARKS**

OF

HON. THOMAS J. LANE

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. LANE. Mr. Speaker, under leave to extend my remarks, I wish to include the following article which has been directed to my attention as a tribute to the courage and wisdom of Massachusetts officials who decided to create the great Quabbin Reservoir—largest in the world—which is published in the current issue of the Lincoln-Mercury Times.

The following article entitled "The Biggest Drink of Water," by Mr. Robert Hodesh, describes the effects of this decision and its impact on four historic communities which had to be erased to make way for progress—and drinking water for the city of Boston:

THE BIGGEST DRINK OF WATER

(By Robert Hodesh)

Close to the center of the newer maps of Massachusetts there is a large blue area, as irregular as an ink blot, which represents Quabbin Reservoir. Although this lake was created for the sole purpose of supplying drinking water to Boston and vicinity, it is large enough to be dotted with 110 rocky and mountainous islands. It is 21 miles long and there is not another man-made reservoir in the world as large.

If Quabbin Reservoir was the result of damming some remote and sparsely settled valley of the United States it would probably not be known as anything more or less than another lake—although, of course, a beautiful one in any setting. However, one does not flood so large an area in so thickly settled a part of the country without doing a great deal more.

In order to clear the way for developing the reservoir, the State legislature had to pass a death sentence on four old towns—Dana, Prescott, Enfield, and Greenwich—which had occupied the valley for a long time. Their earliest houses were built by men who had come into the wilderness from the Massachusetts Bay Colony in the middle 1600's on land granted them as a reward for fighting in the war against King Philip, last of the great Indian leaders in the East.

Roots that are sunk so deeply and securely into the past are not easily torn out—especially not in New England, where the past exerts enormous influence on the present and has greater importance than the future. The source of New England pride is antiquity. In the four towns erased by Quabbin Reservoir, as in all New England rural areas, there were families whose lives were an accumulation of memories, of old splendors, of historic triumphs and glories, and on all these they based their character and their integrity.

The homes, many of them, were made a century or two ago, when love of craftsmanship was the principal motivation of builders. Much of the furniture had become priceless antiques, and the dinner plate and silverware had become collectors' items. All of these established a continuity with the past which would never have been broken except through some unforeseeable upheaval like the flooding of the land.

Therefore, when progress, or the future, or the demands of commerce, as represented by

an act of the Massachusetts Legislature, decreed that the visible evidences of the past were to be destroyed and removed, a momentous turn came in the lives of the valley's residents. The emotional implications of Quabbin appealed to writers of fiction, and one result was the appearance of novels based on the situation.

It was necessary for the metropolitan water commission, which built Quabbin, to displace 2,500 persons, destroy 650 houses, and disinter the 7,500 ancestors of the inhabitants who were buried in 34 cemeteries. The latter job was handled with skill and respect, each individual history being investigated and records carefully made.

A number of the more beautiful houses were reassembled in other parts of the country. One is in Deerfield, Mass., itself a museum of architectural treasures; another has been added to the beauties of Charleston, S. C.; there is another in California.

When the dams were built and it was time for the people to go, there were many farewell parties and ceremonies. The town selectmen had to bring an official end to their own corporate existence, which was a little like signing one's own death certificate. Square dances were held in the town halls before the end, but they were probably the saddest civic parties in the towns' histories.

Now a lake with 180 miles of shoreline rolls over the valley. Thousands of tourists stop annually at Winsor Dam and visit the tower on Quabbin Hill, or drive into the lovely Pelham hills to see the island-studded lake from the heights.

The stories of how the towns came to an end are in marked contrast to the reports of a celebration on Borton Common in 1848, when Boston got its first water supply. There was a salute of a hundred guns and all the bells in the city were rung. The governors of the New England States were there, along with the president of Harvard, and an impressive array of the Nation's great. Among the happiest celebrants, history relates, were members of temperance and total abstinence societies.

The dams were closed only a few years ago and the valley has swallowed its allotted amount of water. This monument to great engineering and great sorrow holds 415,000,000 gallons of water for Boston. No greater tribute was ever paid to a city's clean living habits.

Address of Hon. John J. Koehler**EXTENSION OF REMARKS**

OF

HON. EDWARD J. HART

OF NEW JERSEY

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. HART. Mr. Speaker, last evening at the Mayflower Hotel in Washington, a testimonial dinner was tendered to Hon. John T. Koehler, retiring Under Secretary of the Navy. Many of Mr. Koehler's associates in Government, representatives of the shipping industry, leaders in maritime unions, and Members of the House of Representatives were in attendance. Many sincere tributes were paid to the high character, superior ability, and lasting accomplishments of the distinguished guest of honor.

It is a genuine pleasure to include under extension of my remarks the ad-

dress delivered by Mr. Koehler on this delightful occasion:

It is very difficult for me to put into words my deep appreciation to those of you who arranged this dinner and to all of you who took time out of crowded schedules to be here. I can best sum up my feelings by saying simply, "Thank you very much for the friendship and good will which inspired this affair."

I leave the Navy with reluctance and regret. I have been a part of the Navy for almost 10 years and, during that time, I have come to know it intimately and well. I have served as lieutenant commander and commander, as counsel for the Bureau of Ships, as assistant general counsel, and as Assistant Secretary. I was a part of the Navy when it reached the zenith of its formidable striking power in World War II and, in contrast, I was a part of the Navy during the lean years of 1948 and 1949. Although I would be the last to admit, at least in the presence of Members of the legislative body, that a certain amount of financial adversity may well be as beneficial to military departments as it sometimes is to men, nevertheless the Navy has lost that lean and hungry look and is well on the way to regaining that strength which is so essential to our national security.

As most of you know, the primary function and responsibility of the Assistant Secretary of the Navy is in the field of procurement. Although procurement as such for the Military Sea Transportation Service is but a relatively small part of Navy procurement demands and activities, it was in the area of procurement for MSTs that I first became acquainted with the maritime industry and the direct bearing of that industry upon the ocean-shipping requirements and responsibilities of the Armed Forces. These responsibilities were entrusted to the Navy as a part of the unification program and the mission was assigned to MSTs. My short tour of duty with the Maritime Administration also gave me an opportunity to learn a good deal about merchant shipping affairs in general. Consequently, when I returned to my Navy duties, more especially to the concerns and tasks of MSTs, I was better equipped to cope with its responsibilities and obligations.

The Korean affair has provided an ideal testing ground of the need for and the effectiveness of MSTs in serving the ocean transportation requirements of the Armed Forces. It was inevitable that, in discharging its responsibilities, MSTs would be on the receiving end of a considerable amount of criticism. Most of this criticism was the result of perfectly understandable apprehensions on the part of private industry concerning the possible adverse effect of a shipping organization run by a military department. At least in the early days of the organization, we were accused of empire building and of making unwarranted encroachments on private industry. On several occasions, I urged industry not to accept these views and, at this time, I believe it is fair to state that, despite all the pressures and urgency of action which have been required in carrying out the Korean task, MSTs has not, in the true sense of the word, been in competition with private shipping. On the contrary, I think we have been reasonably successful, in carrying out our defense responsibilities, in making the fullest utilization of the tools and facilities of private industry and in establishing close collaboration with other Government agencies.

Since most of us here this evening have a direct and immediate interest in ships and shipping, I think it would be appropriate at this time for me to restate for you the basic principles which have guided the Navy, and thus MSTs, in its relations with the maritime industry.

First of all, it appears clearly to be outside the province of the military to think of merchant shipping and its allied industries in any light other than that of adequacy and availability to meet national emergency shipping requirements. If the requirements of readiness, of type, and of numbers of merchant vessels are to be met in time of crisis, there must be in existence a substantial privately owned merchant marine which, because of its commercial peacetime utilization, constitutes a ready weapon for immediate use as an auxiliary for military purposes. It is, therefore, an essential obligation of the military to encourage, promote and aid a strong, adequate, privately owned merchant marine.

Since August 1949, the Navy, through MSTs, has attempted to discharge its responsibilities for the sea transportation requirements of the military departments and has attempted to live up to its obligation to promote a healthy American merchant marine. It was natural that some conflicts were bound to arise but we believe that we have kept them to a minimum. Moreover, as I said on an earlier occasion, where disagreements and conflicts do arise, it would appear far more desirable that they be resolved by cooperation and collaboration than by the imposition of legislation which might well rob the present arrangement of that flexibility and freedom of action which is so essential for national defense purposes.

The Hungnam evacuation in December 1950 is an excellent illustration of the flexibility of the present arrangement and the manner in which MSTs utilize the tools of private industry. In that operation, as you all know, 105,000 fighting men, 100,000 civilians, 17,500 vehicles, and 350,000 measurement tons of material were safely redeployed despite enemy fighting, bad terrain, worse weather and inadequate shoreside facilities. This successful redeployment by sea of an army could not have been accomplished without the fullest cooperation of all concerned, including the ships and crews of the American merchant marine which were a vital component of that redeployment. To my mind, there is no better example, no more practical illustration of what we have all meant by cooperation and collaboration between the Navy and the merchant marine.

Another basic principle which has governed the Navy in this particular field has been a recognition of the need for coordination of the activities of the military and civilian agencies of Government responsible for ocean transportation. To this end, we have spent many months negotiating with representatives of the Department of Commerce and of the Maritime Administration of that Department. It gives me no little satisfaction to know that an agreement now exists between the Departments of Commerce and Defense which makes provision for an orderly, efficient, and effective use of ocean transportation in times of peace, in times of limited emergency, and under full emergency conditions. In my opinion, this agreement is of great importance and is very necessary. It represents a new approach to a problem which has been with Government and industry during two world wars. It recognizes the new placed assigned to the Navy in the all important field of transporting men, equipment and supplies to foreign shores whenever the interests of the United States so require.

This particular agreement, recently signed by the Secretaries of Commerce and Defense, recognizes the dual responsibilities of MSTs and the National Shipping Authority of the Department of Commerce with respect to the efficient use and operation of merchant vessels. It provides for the fullest practicable use of privately owned shipping. It establishes a formula for the allocation of mer-

chant vessels to MSTs by NSA as the rise and fall of military requirements dictates. Finally, but not the least important of the considerations which inspired it, the agreement provides for the maintenance of a nucleus MSTs fleet to meet military exigencies at all times and under all conditions.

Those of us in the Departments of Commerce and Defense who were responsible for the negotiations and ultimate form of this agreement believe that it effects a balancing and preservation of interests between MSTs and private industry on the one hand, and, on the other, between MSTs and the Government agency entrusted with merchant shipping responsibilities at the civilian level. It goes without saying that the agreement requires the closest kind of cooperation and coordination between industry, MSTs, and the National Shipping Authority if it is to serve the purposes for which it was designed, namely, to further our national defense effort.

I would feel delinquent if I failed to say a few words about the foresight and the understanding approach which characterized the efforts of those who sought to bring about a working agreement of this kind. I would like to thank Secretary Sawyer, Under Secretary Rentzel, Vice Admiral Cochrane, and Mr. Holler of the Department of Commerce, for their continuing interest and effective aid. Mr. Rentzel and Admiral Cochrane in particular spent tedious hours aiding in the formulation of the agreement between their department and ours. I should like to add a word of appreciation for the assistance given to this undertaking by Mr. Grover Plowman, Special Assistant to the Secretary of Defense.

I believe that it is also appropriate for me to mention, however briefly, the Committee on Transportation and Storage of the Office of Defense Mobilization which has Mr. Rentzel as its chairman. This committee concerns itself, at the policy level, with all fields of transportation affecting the national defense and thus covers land and air as well as sea transportation. While it has carried on its work without fanfare, there is every indication that this committee will prove to be of the greatest possible value, particularly if we should find ourselves engaged in all-out war.

In closing, I should like to pay my respects to those who have assisted me in carrying out that part of my responsibilities involving ocean transportation problems or, if you will, the business end of the work load of MSTs. At the command level, of course, the late Admiral Sherman gave to MSTs vitality, strength, and direction. At the operational level, Vice Admiral Bill Callaghan and his able assistants carried out the policies of the organization in a manner which has commanded the respect and admiration of all of those who have realized the extent of the load which he and his people were required to carry at the height of the Korean action, a task which is still with us. With respect to my own staff, Frank Haley and Captain Lee, my naval aide, have given me sound advice and counsel. Mr. Haley, because of his intimate knowledge of ships and shipping, kept me on the right track on innumerable occasions.

I am deeply appreciative of the assistance I have unfailingly received from all of those with whom I have been associated. No job in Government, whether it be carried out in times of complete stability or in periods of great tension, can ever be well done without the cooperation and support of those who make up the team. I shall always be grateful for the cooperation and support I have received and my sincere thanks go to the many people who have contributed so much.

A Tribute to Canada

EXTENSION OF REMARKS

OF

HON. BROOKS HAYS

OF ARKANSAS

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. HAYS of Arkansas. Mr. Speaker, on August 4 the Toronto Globe and Mail, one of Canada's leading newspapers, carried an interesting letter from a prominent citizen of Arkansas, Mr. John Park Cravens. Under leave to extend my remarks I include Mr. Cravens' letter, as follows:

A MESSAGE TO CANADA

I was born and reared in the Ozark Mountains located in the central southern United States. The rivers and mountains were given French and Indian names before the United States Government purchased this mountain range from France in the Louisiana Purchase in 1803.

Near the little town in which I live is Mount Magazine (Magasin in French), named by the French about two centuries ago. It is known as the highest peak between the Rocky and Allegheny mountain ranges. One mile from my home is the River Petit Jean, named by the French for Little John, an exploring French soldier killed on the river while fighting the Indians.

Years later the Indians left and then came the white settlers, practically all of Anglo-Saxon descent. My forefathers were of Scotch, Irish, English, Welsh, and French descent. And in the days of my grandparents it was truly a land of Elizabethan ways, and in some respects is yet. In my clan were the Cravens, the Arvecks, the Rices, the Brooks, the Jacksons, the Harwells, the Parris, the Popes, the Lanes, the Connors, the Carpenters, the McKinnies, the Herndons, the Rogers, and others.

BIRDS FROM CANADA

In my youth I was truly a nature boy roaming the mountains hunting game, fishing in the streams and hunting Indian arrowheads, pottery and their various relics when I was not at work at home on my father's farm.

I was an admirer of many types of game birds, and from the north every year came many beautiful specimens of migratory birds to build their nests and raise their young, and some would stay only a few days and continue their flight on to the south. And one day in my youth I asked my father where these birds came from when they would come winging in out of the north, and he replied, "Canada."

"Canada." In my youthful heart, mind and soul for a land there was no name more beautiful. In my mind I associated the beauty of the birds, their songs, their freedom of flight and my admiration and love for them with Canada. And when I advanced far enough in my school grades I began to study about Canada and the British Empire. And many times from the Ozark mountain tops I would gaze far into the north and think of Canada that great land so far away.

In these Ozark mountains when the weather is clear the rising and setting sunsets are beautiful, and in my youth I loved to watch them. But more beautiful of a clear night was when I would go alone to a giant cliff a half-mile from my home and there look toward Canada and see the North Star.

GOD'S NIGHT LANTERN

I thought of the North Star as one of God's great night lanterns to the people of Canada and the northland. Silhouetted against the sky were birds in flight from your land toward the south, and the North Star had lighted up the landmarks and streams to guide the way. Sometimes I would climb to the top of a tall pine tree to get a higher view and wish I could take wings like a bird and fly to your great land for a few hours' visit, and I imagined it would be an enchanted paradise, the land of rainbow waters, and the land where a fairy king with his magic wand gave the birds those beautiful colors and tunes.

I have never been to your country, but it has since my youth been a part of my mind, heart and soul. To me there is no boundary between Canada and the United States when it comes to my loyalty and love.

The birds I loved in my youth and also love today knew no boundary line between Canada and the United States. And may our two countries forever be this way in relationships and spirit, and may persons of my country and your country who in their youths idealized that land beyond the horizon never have that ideal shattered.

At the age of 18 I volunteered as a United States soldier in World War I. And today I have a 19-year-old son who is a United States soldier in Korea. Oh, beloved Canada I have seen your fighting men who are braver than the bravest of the brave. Oh, sons of the Land of the North Star. I will never forget Mons, Vimy Ridge and Flanders Fields. And since then down through the years every bird I see from your country that has the color of red about it, I think of the blood your sons shed and their lives they gave for your country and my country. Oh, men of Canada. You go into battle with hearts and bodies as strong as your stately forests, your hearts as pure as your driven snows and your rainbow waters, your minds and purpose as clear as your golden sunshine and you were as free as our fowls of the air, and to protect this freedom you died so willingly, so gloriously and so bravely. May the eyes of no foreign enemy ever see your stately forests, your rivers and lakes of rainbow waters, your snowcapped mountains, your golden valleys, your beautiful villages, towns and cities.

GET BETTER ACQUAINTED

And may God grant that only the wings of our birds and our planes will ever fly over our lands. I have never seen any planes other than our United States planes in the air over my native mountains here. I would dearly love to see some Canadian planes winging in from the north. It would thrill me as much as a flock of birds winging in from Canada in the days of my youth. The people of Canada and the United States should get better acquainted and learn more about their neighbor.

Just as God set forth in His plans ages ago for birds of the air during certain seasons to wing their way south so has your country carried on a pride, a tradition, a loyalty, a justice, a culture, and a progress that has lived for hundreds of years. And such lives in the hearts, souls, and minds of all classes of your citizens, and their reverence for these things in godly, and in it there is a strength that can never be overcome by any enemy.

The location of your country and its type resounds with freedom and I believe in the near future years a progress unequalled will come to it.

MILLIONS TO COME

The birds still follow their paths, and always they have an objective. And too, your great country has an objective I believe the good Lord means for it to reach in His future

plans for this world. My opinion is there is a glorious future for Canada. Millions of liberty-loving people seeking homes will turn their eyes toward the vast domains of your country. In the near future years a great general progress and an increase in millions in population will cause Canada to come into her own.

May the flags of Canada, the British Empire, and the United States fly forever as symbols of world leadership, liberty, righteousness, and progress. In conclusion I say:

God bless Canada

God save the King.

JOHN PARK CRAVENS.

MAGAZINE, ARK., U. S. A.

Mr. Speaker, as evidence that Mr. Cravens' tribute to Canada and the people of the Dominion was well received, the *Globe and Mail* on the same date commented favorably upon Mr. Cravens' statement. The editorial is as follows:

WHAT A NEIGHBOR KNOWS

Elsewhere on this page today we publish a letter which is poetic in its inspiration, majestic in its conception and heart warming in its sincerity toward this Dominion.

"I have never been to your country," writes Mr. John Park Cravens, of Arkansas. Although he has not been here, most assuredly in his heart he has long dwelt among us. It was his mind, guided by the literature he has read and the personal contacts he has made with Canadians, which perceived the immensity of our country and its potentialities. But it was his rich and resourceful imagination which endowed Canada with a nobility and integrity that now in turn should challenge and inspire us.

"No name more beautiful than Canada," it has seemed to him, when the winging birds came down in their timeless custom, and the North Star whispered to him of a land he had never seen yet vividly knew as only poets can know. His nature reveals itself as he involuntarily employs the sweeping colors for Canada which a cosmic brush bestowed in such bewildering lavishness on his native Ozarks.

"So has your country carried on a pride, a tradition, a loyalty, a justice, a culture, and a progress that has lived for hundreds of years." "Millions of liberty-loving people seeking homes will turn their eyes toward the vast domains of your country" It is profoundly moving to know that such deep trust and friendship exist for us who as a nation have too often not had a self-confidence to match these sentiments. May we be worthy of our neighbor's high assessment and his intensely reasonable prophecy. Even better than he knows what we are, does he know what we should be.

William N. Oatis

EXTENSION OF REMARKS
OF

HON. KARL M. LeCOMPTE

OF IOWA

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. LeCOMPTE. Mr. Speaker, the good citizens of this country are greatly concerned over the imprisonment in Czechoslovakia of William N. Oatis, who represented the Associated Press bureau in Prague. This matter came up for consideration at the meeting of the Oskaloosa, Iowa, Aerie of the Fraternal Order

of Eagles, and a resolution was adopted that I wish to bring to the attention of Members of Congress.

Under leave to extend my remarks in the RECORD, I include this resolution:

RESOLUTION ON WILLIAM N. OATIS

Whereas William N. Oatis, Associated Press Bureau chief, in Prague, Czechoslovakia, a free newspaperman who was performing his duties according to the standards and criteria of the free press of the world, was brutally snatched and imprisoned by the Communist government of Czechoslovakia without explanation, and

Whereas Mr. Oatis was arrested and held in detention without access to friend, Embassy representative, or trusted legal counsel, and

Whereas he was brought to trial and accused of insisting on obtaining accurate, correct, and verified information, which is the definition of the work of a free press; and

Whereas he was forced into admission of espionage because of his reporter's instinct for presenting the factual rather than the fictional; and

Whereas he was convicted and sentenced to 10 years of imprisonment by a trial which was universally condemned by all free nations as an outrageous kangaroo court, completely bereft of the principles of justice and the dignity of the human being; and

Whereas by its action, the Communist-dominated Czech government showed its scorn for the principles of freedom of information and its hatred for our free world; and

Whereas representatives of the Soviet news agency, Tass, have the free run of the United States of America, and are permitted to attend press conferences at our national seat of government, at which often much off-the-record information is discussed: Now therefore be it

Resolved, That Oskaloosa Aerie, No 276, of the Fraternal Order of Eagles urges the Federal Government and its agencies to be unceasing in its efforts to secure the freedom of Mr. Oatis by honorable means, and we also offer our support and the vitality of our membership to the executives of the Associated Press in their campaign to secure the release of Mr. Oatis by the communication of the true facts of the case to the free peoples of the world, and be it further

Resolved, That Aerie No 276, of the Fraternal Order of Eagles urges the Federal Government to bar the correspondents from the Soviet news agency, Tass, as well as all satellite nation correspondents from official Government press conferences where vital information may be revealed until the release of Mr. Oatis has been secured.

The Economic Revival of New England

EXTENSION OF REMARKS
OF

HON. THOMAS J. LANE

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. LANE. Mr. Speaker, under leave to extend my remarks, I wish to include a very enlightening and instructive article that appeared in the *New Republic* on August 20, 1951, by Solomon Barkin, on the subject of the economic revival of New England.

This up-to-the-minute report by Mr. Barkin is a very timely and informative

statement of the facts as they really are by one who has given considerable thought and study to this subject matter.

In his position as director of research of the Textile Workers Union of America, CIO, he is in a position to speak from authority backed by a wealth of actual experience.

The article follows:

THE ECONOMIC REVIVAL OF NEW ENGLAND
(By Solomon Burkin)

The New England economy faces problems in many respects similar to those of old England. The major manufacturing industries of the region are contracting. Its business leaders are more concerned with protecting accumulated capital and the status quo in general than in promoting regional progress. Businessmen and local governments in these six States are, on the whole, meeting the challenge of the times with less vigor and imagination than are their opposite numbers in old England. The solutions to the problem of economic stagnation in New England are fairly palpable and require no regime of austerity, but the determination to find them is faltering and the organizations are less available for achieving these goals.

The need for a structural readaptation of New England's economic activities to modern trends and the rebirth of alert business leadership is boldly spelled out in the report on the New England economy recently released by a group of New England economists recruited from each of the six States of the region. It is the first over-all, detailed study in 15 years candidly to analyze the problems and outline the opportunities in New England. This report was prepared at the request of the President's Council of Economic Advisers, and publication of it was paid for by the Federal Government.

CIO unions in the area and liberals like Chester Bowles have expressed alarm in the postwar years at the failure of the people in the region to face up to the facts about industrial contraction and have pressed for such an investigation.

But it is characteristic that until a Federal agency stepped into the picture, it was not possible to obtain agreement on a coordinated study by a group within the region. Attempts by the New England governors to set up a New England Development Authority compact were defeated by the utility interests who feared that an attack on the high power rates in the region would result. More intensive studies of the problems raised by this committee are being made under national guidance by a Federal interdepartmental agency on New England-New York resources, and by the Committee on New England organized by the National Planning Association.

The failure of local people to initiate a movement for the revitalization of New England's economy is symptomatic of the absence of enterprising management. The committee report stresses that family enterprises have favored dynastic control, with a resulting decline in the quality of management and the disappearance of the kind of enterprising spirit which activated the early Yankee businessmen and traders.

The committee deplors the lethargy and complacency which prevail among New England industrialists. They have not, with few marked exceptions, taken up new ideas, processes, products, and techniques. Plant and equipment have been permitted to drift into obsolescence. New supervisory and managerial talent here have not been recruited. New England industry has made less use of research than other regions. Owners have drained their companies of

their capital. Speculators have been allowed to buy older companies to wring them dry, use them to advantage in tax calculations and sell them as real estate. Relations between employers and unions have been devoid of originality or willingness to depart from habit-worn patterns.

Instead of tackling technological and social problems with the ingenuity inventiveness and shrewdness which produced the flowering of New England, its industrialists have taken a defeatist position, insisting that the handicaps facing them are insuperable. Enterprise had been discouraged by the persistent talk of differentials on labor, materials, transportation, fuel, taxes, etc. New England Congressmen rose almost as one man against an industry decentralization amendment to the Defense Production Act. Although New England's electric-power rates, both to retail consumers and industrial users, run from a third to a half more than the national average, Senator AIKEN of Vermont has been obliged to carry on single-handed the fight for public-power development and the advancement of the St. Lawrence seaway and power project. Proponents of this project propose that New England be assigned a substantial bloc of the 2,200,000 horsepower capacity that will be generated near Massena, N. Y. Power "brown outs" have handicapped industries in New England in recent years.

Only a very few declining New England communities have undertaken to create diversified types of employment—and in these cases only when virtual bankruptcy, due to total shut-down of textiles or some other similar old-line industry, occurred. State governments have fallen down badly in aiding small business. There are only scattered illustrations of genuine promotional effort by local groups to obtain new enterprises. Nor have the industrial leaders taken advantage of the defense program to expand and modernize their plant capacity and to strengthen the newer industries. No plans are in the making for developing employment for the larger number of older persons displaced by the contracting industries. Groups are rekindling the extension of natural-gas lines which would reduce fuel costs. The committee concludes that the New England States have not made the most of their assets either in economic terms or in respect to the natural resources of the area which could be developed without such large appropriations as projects in the West or the South have required.

Besides suffering from unenterprising management, New England's financial wealth is substantially concentrated in trusts and insurance companies. These institutions put "safety first" in investment policy. They are inclined to close down businesses to preserve their capital rather than risk additional funds to revitalize a concern that has run down but could be put back on its feet. The investors are more often rentiers than venturing businessmen. The bolder financial interests have invested outside of New England in new areas where profits seem more assured and have sent their more promising managers to those places. A recent RFC report on the ownership of a Texas oil concern read like the social register of Back Bay Boston. New England has not been offering funds for new businesses in its region in proportion to its needs. The beneficiaries of New England fortunes have shown little regard for the economic future of the region.

A particularly baffling factor in the decline of New England is given only a sort of discreet but hasty glance in the report made for the Economic Council. American vitality rests on initiative and opportunity. New England's dominant economic groups have lost the former and restricted the latter. Through their economic controls the older population repressed the newer "ethnic

and religious groups." Although these groups constituted a growing proportion of the population, their vigor, alertness and vitality were not encouraged. Even as of the current date, few men stemming from this stratum of immigration are owners of significant regional manufacturing enterprises. Members of these racial groups have built sound local businesses, but almost entirely devoted to serving their own community. The discrimination exercised by the "Yankee" has deprived New England of the versatile pioneering spirit of these people. Only since the last war have there been an impressive number of cases of people descended from these new groups coming prominently to the fore in the local industrial scene. New England has paid the price for the undemocratic attitudes of its dominant groups.

The committee of economists who prepared and signed this stimulating and helpful report has not proposed any mechanism by which economic progress can be brought about in New England. Clearly a central agency is needed which will investigate possibilities, promote and push new enterprise, and rekindle a faith in the future of the region in the minds of the men who control the capital reserves and the vested interests, such as railroads, banks and power companies. Interstate compacts as a method of getting things done have failed repeatedly.

It is painfully clear that without action by the Federal Government nothing positive or important will get underway. The State governments will not fall into line until the power lobby, the port of Boston group and their friends, have been ousted from the driver's seat on all basic issues affecting the region. The committee report spells out some important first steps that must be taken, including the location of a steel mill in the region, which would make possible new metal fabricating plants.

Regional and community institutions of learning and more extensive aid from the United States Department of Commerce are suggested as means of improving technical and managerial competence. The committee recommends venture-capital corporations to promote new local enterprises. Even here, however, without Federal aid and guarantees, nothing substantial is practically feasible.

We can join in the above and other recommendations offered by the committee, including the high national minimum standards of working conditions and a local stockpile of public works to meet recessions. But the guarded statements on power will hardly produce lower rates. Nor do we believe that the need for stimulating economic growth in New England justifies the shifting of the tax burden from the high-income groups to those less able to pay. Economic incentives may have to be created in ways such as those provided by the DFA.

New England can grow. Its opportunities are many. The rich reserve of human talent must be tapped by encouraging enterprise, particularly among the newer ethnic groups. The large universities can do more to stimulate more local settlement of its promising graduates. The secondary-school system must be reoriented to provide the training necessary for the growth of the newer industries. Many new industries are being built on the research conducted by the major New England universities, they can be located in New England. The contiguity to Canada's rich resources promises new developments. A more concerted program which commands the confidence and support of, and promises benefits to, all the people can succeed. Perhaps an organization must be founded by the everyday people of New England, headed by the progressive elements including the trade unions, to lead in the industrial and economic growth of the region.

The Cotton Farmer**EXTENSION OF REMARKS**

OF

HON. FRANK E. SMITH

OF MISSISSIPPI

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. SMITH of Mississippi. Mr. Speaker, under unanimous consent, I include an article from the Greenville (Miss.) Democrat-Times:

LOOKING AT THE SOUTH

(By Hodding Carter)

CONDEMNING FARMERS IS RANKEST HYPOCRISY

In some quarters there has developed of late a habit of hopping on the farmer, and particularly the cotton farmer, as being a money-lusting parasite fattening on the purses of his fellow Americans.

Right now the loudest noise is being made in the direction of the cotton South because of the cotton growers' anger and worry over the 10-cent a pound price decline that followed the crop estimate of more than 17,000,000 bales. These critics say that the cotton crop will bring a half billion dollars more than a year ago, so what are the farmers crying about?

Well, I don't think that question is hard to answer. To begin with, a half billion more dollars reflects only the size of the crop, which will be about 7,000,000 bales more than a year ago. That bumper crop has been produced because the Government urged the farmers to go all out for cotton as a patriotic response to the demands of national defense. That crop is being produced at the highest cost in history—cost of fertilizer, cost of labor, cost of poisoning, cost of equipment—not to mention cost that can't be computed, arising from the return of pasture and diversified crop land to cotton. The end result for the cotton farmer is less money and more expense.

Sure he's aroused. If the farmer were unique in wanting to make money, if he were robbing a nation which everywhere else was holding the line, if the South's income were as high as the Nation's average instead of less than 70 percent of the average, if the South's cotton were selling at or over the world price, if the price of raw cotton were responsible for the high cost of cotton goods—if all these if's were facts, then the rest of the Nation would have a right to complain.

But the critical industrialist or labor leader is the rankest kind of hypocrite when he condemns the southern cotton grower for accepting Government price supports or putting part of his crop into the Government loan in the hope that it will cause prices to rise in proportion to production costs. American industry has for generations been accepting governmental aid in the form of protective tariffs that mitigated principally against the farmer. American industry has waxed fat on governmental cost plus contracts. American industry fixes its prices and it doesn't go broke because of price collapse or bad weather or overproduction. American labor is protected, as it should be, by wage and hour laws. And labor's earnings during and since the war years have risen out of proportion to the cost of living.

But the cotton farmer is a traitor and a leech and a fat profiteer. Maybe so. But I won't believe it, not as long as I can read or see or think; not as long as I can count cotton millionaires on one hand and business, industrial, and professional ones by the hundreds; not as long as nature can play hob with man's hopes as it has in my own section this year. In short, to hell with it.

United States Morals Ebbing, Food**Officials Say****EXTENSION OF REMARKS**

OF

HON. HOMER D. ANGELL

OF OREGON

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. ANGELL. Mr. Speaker, on the important problem facing the Nation regarding the decline of public morals in official life, I include an article appearing in the Washington Post of September 26, 1951, by Thomas Winship, as follows:

UNITED STATES MORALS EBBING, FOOD OFFICIAL SAYS

(By Thomas Winship)

"Wrongdoing has brought the United States to a most shameful period," Austin S. Igleheart, president of General Foods Corp., said yesterday.

"And, sad to tell, the tendency is toward shamelessness," he said, saying a complacent public was partly responsible for recent headlines on crime, corruption, and influence peddling.

He said "many Americans have either lost their sense of unrightness or have willfully been doing what they know to be wrong—the more so, since the rest of us have inclined to let them get away with it."

Igleheart spoke at a Statler Hotel breakfast of the National Association of Food Chains. Some 1,800 delegates are attending the association's eighteenth annual convention, which closes Thursday.

He called upon the food industry—"which has more contact with producers and consumers than any other industry"—to help make a real "fight for internal morality. * * * You and I have to be healthy of soul. We cannot sit on our backsides and slide uphill."

The bulk of Igleheart's speech was based on an improbity poll he recently conducted among members of the Association of Food Chains.

"Improbity is a big word," he said, "but it takes a big word to cover all the moral and spiritual relapses you are hearing about these days. Everything from shoplifting and dope peddling to black marketing * * * from cribbing by cadets and bribery of legislators to perjury by Communists * * * from the giving and taking of deep freezers and mink coats to the outright sale of political jobs * * * and from sheltered gangsterism to selfish opportunism."

The poll, he said, showed that thefts have increased in food stores.

He quoted one answer. "Increased stealage is only part of a new pattern of things. Embezzlement, returned checks, not only those that are no good, but those that float constantly for lack of sufficient funds—a growing habit of regular clientele."

Said another answer: "Our managers have asked for help, and we have assigned one man to survey the situation. We now prosecute. We have noted a desire to secure packages of Canadian bacon and luncheon meat without cost."

Igleheart said the main impression he got from all the answers is that "many of you think there is something wrong with present government."

Interpretation of the answers, he said, serve to lump the bad influences under these four headings: "(1) Poor leadership, (2) Santa Claus of the false philosophy of something for nothing, (3) bad examples set by unscrupulous politicians and by delinquent parents, (4) weakening of religious training in homes and schools."

In a morning panel discussion, a top Office of Price Stabilization official told the chain-store operators that the Government's meat program is deteriorating and that failure of Congress to set slaughtering quotas may be the straw that breaks the camel's back.

The Senate Banking Committee yesterday approved a modified plan for slaughter quotas.

Edward F. Phelps, Jr., Assistant OPS Director, said his agency cannot maintain workable beef controls under existing conditions.

There are some of the "less ethical people in the meat business," he said, "who do not care what they pay for cattle so long as they get supplies."

At yesterday's luncheon meeting, Dr. John A. Hannah, president of Michigan State College, described the food distribution curriculum instituted last year at Michigan State.

Russia on the Run**EXTENSION OF REMARKS**

OF

HON. SAMUEL W. YORTY

OF CALIFORNIA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. YORTY. Mr. Speaker, I should like to direct attention to an article by Mr. Virgil Pinkley, editor and publisher of the Los Angeles Mirror. The article analyzes the cold war and is especially encouraging because the writer was a very distinguished foreign correspondent before becoming editor and publisher of the Mirror. The article follows:

FOR YOUR INFORMATION

(By Virgil Pinkley)

History seldom has seen a country make as many mistakes in so short a time as Russia.

A quick cut-back to the year 1945 will prove this conclusion.

At that time Soviet armies were hailed as defenders of democracy. The popularity of Russia throughout the world was at an all-time high. The name Joseph Stalin was on almost every lip. We, and our closest allies, were ready to grant Moscow many concessions. We did.

That was 6 years ago. What is the situation today?

Russia is supported only by her slave states. Even in these countries underground opposition grows.

Today we and other nations no longer quake when Moscow speaks or threatens. An outstanding example of this new attitude was the Japanese Peace Treaty negotiations wherein 48 nations voted against Russia and the poor, miserable, unfortunate vassal states of Poland and Czechoslovakia.

WE TALK BACK

Today the President, our leading political figures and top military men slam broadside after broadside at Russia. We and our friends physically stand up to the Kremlin. We talk back. We meet demands with equally tough counterdemands. We even fight propaganda with propaganda.

In short, we are on the offensive. The play has been taken away from Joseph Stalin and company on most matters.

When World War II ended Russia faced among problems the following:

1. Germany.
2. Japan.
3. The need to secure petroleum and steel.

4. A tighter economic and political control over Western Europe. This was to be followed, of course, by military control.

5. Spreading and strengthening of communism.

6. Prevention of military strength by the United States and other leading powers.

7. Gaining access to the Mediterranean.

8. An iron-clad control of the Balkans and Central Europe.

9. Support in the United Nations.

It is true that Russia has won over Red China and Northern Korea. Additionally an uneasy occupation has been installed in Poland, Czechoslovakia, Rumania, and Bulgaria.

RUSSIA LOSES GROUND

But Russia has lost ground in solving or overcoming virtually all the other major problems.

Today Western Germany is with the west. That includes nine-tenths of the industrial output of all Germany, most of the wealth and three-fourths of the nation's population. The danger for Russia of eventual war with Germany is greater than from any other quarter. History and geography dictate this.

Japan is on our side. Russia has lost out completely in dictating any part of the Japanese peace treaty or in having any voice in the affairs of that nation.

Since the war Russia has gained very little petroleum or steel.

BLINKERS ARE OFF

Communism has been dealt a series of body blows. The greatest of all has been in the United States. At long last we have taken off the blinkers and rose-colored glasses. We now know communism for the godless, ruthless, totalitarian, imperialistic creed that it is.

Since the United States is the world's leading Nation, our action on communism will determine largely what the remainder of the non-Communist world does.

In Italy and France Communist Party membership has been cut in half. In the Low Countries and throughout Scandinavia communism has lost favor.

Soviet moves have brought about the greatest peacetime rearmament in history.

WHAT WE HAVE DONE

The Kremlin's policies have brought about the North Atlantic Pact and the creation of General Eisenhower's armies in Western Europe. They have caused us to mobilize military forces well in excess of 3,000,000, to build an Air Force of at least 95 groups, to take united action in Korea, bring hundreds of ships back out of mothballs or rush construction on others. Our whole arsenal of atomic weapons has been broadened and made much deeper. We have created stockpiles of atom bombs that otherwise never would have been made. Our defense production is being stepped up greatly and more is to come.

MORE RED TROUBLE

America's policy with relationship to Greece and Turkey blocked the Soviet march to the Mediterranean. Now these nations are to join the Atlantic Pact. They, as Yugoslavia, are a thorn on Russia's exposed flank. We have backed all this up with a powerful Navy in the Mediterranean and large airfields across North Africa from which most of Russia could be bombed.

Moscow's mad bid for world power has forced us to increase our land, air, and sea forces in Western Germany, Austria, and the British Isles.

Russia has lost control of Yugoslavia. We soon will have excellent new air and sea bases in and around Spain. Italy is growing in strength and joins the side of free nations.

It is a mistake to underestimate the strength of an opponent, it is almost as serious to overestimate the strength of an

adversary. We have done the latter with respect to Russia for too long.

Not that Russia isn't powerful, or the danger of communism very great. But Russia no longer can conquer the world and the Soviets no longer can ride roughshod over freemen.

Grave Markers of Returned War Dead To Be Inscribed To Show Korean Service

EXTENSION OF REMARKS

OF

HON. EDITH NOURSE ROGERS

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mrs. ROGERS of Massachusetts. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following release from the Department of Defense dated September 20, 1951:

GRAVE MARKERS OF RETURNED WAR DEAD TO BE INSCRIBED TO SHOW KOREAN SERVICE

The Department of Defense will begin immediately to inscribe the word "Korea" on grave markers and headstones of United States dead returned from Korea, or whose death is attributable to service in Korea, Secretary of Defense Robert A. Lovett advised President Truman today.

"You asked that I develop an inscription for inclusion on grave markers and headstones of United States dead returned from Korea or whose death is attributable to service in Korea," Secretary of Defense Lovett said in a letter to President Truman informing him of the Defense Department action.

"At my request the service Secretaries considered the matter and agreed upon the use of the word "Korea" as an appropriate inscription. Accordingly, I am directing that this practice be placed in effect immediately," Secretary Lovett said.

Use of the word "Korea" will satisfy official requirements and limitations and at the same time will permit the Department of Defense to comply with requests of next of kin in connection with inscription recognition of cause as well as place of death, Secretary Lovett said.

Secretary Lovett's directive was made retroactive to permit addition of the Korean designation on grave markers and headstones of United States dead previously laid to rest. National cemetery regulations prescribe that the inscription on Government headstones may contain the name, date of birth and death and abbreviations of military awards held, a religious emblem, and the war in which service was rendered.

The regulations do not apply to the graves of servicemen buried in other than national cemeteries. These markers and monuments are of private concern and may be marked in whatever manner the family or relatives determine.

Eating Up the Future

EXTENSION OF REMARKS

OF

HON. DANIEL A. REED

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. REED of New York. Mr. Speaker, what does a corrupt administration pro-

duce? It produces moral, intellectual, and material waste. It produces inflation. Inflation destroys not only material resources but it destroys courage, ambition, initiative, great purpose, and ideals. It lowers the standard of living; it breeds communism.

Under leave to extend my remarks, heretofore granted, I am inserting the following article by a distinguished reporter, Frank Tripp, which appeared in the Olean (N. Y.) Times Herald, September 24, 1951:

This is a story of a man who understands inflation better than all of the economists in the world. He is an authority on it, and a victim of it, with no trick solution to offer.

He has come to the conclusion that all the common man can do about inflation is to produce enough to keep up with it. Expert manipulation to control and correct it has accomplished little for him.

Instead he believes that the dog house in which he abides in his old age was created by man's meddling with the laws of nature and supply and demand. There are no charts, graphs, or promises in his analysis. His is a simple, cruel experience story, a course in inflation that anybody can understand.

He once owned a profitable business of many years standing. When he reached 80, the country's economy was stable. What has since happened to it was unforeseen. He had accumulated as much as he felt he needed to see him through.

He didn't aspire to be wealthy, had a wife but no family and enough to live comfortably, he thought. So he sold his business and retired. His friends envied him the life of leisure and travel that he planned.

His then sufficient nest egg consisted of investments, ready cash, a little modest rental real estate, and his home. It all looked as secure and enduring as Gibraltar. Today, well past 80, only his home is left and he lives meagerly off the controlled rent that he gets from his second floor. He had to eat up his future.

He saw the dollars he had saved halved in purchasing power, then halved again while things he bought soared higher, many beyond his reach. He saw his life's competence disappear four times as fast as he expected and was helpless to prevent it.

He sold his car, quit his clubs, stored his beloved golf sticks, sat on his porch, and saw the changing world pass by. When you ask this man who learned the hard way, a way that would have crushed a lesser philosopher, when you ask him for the answer, he gives a simple one. He doesn't fly off in a tirade; he rationalizes his predicament and takes half the blame upon himself.

He just says that in our pyramiding economy no man can preserve what he has without producing a considerable part of what he meantime consumes. He says that these days, when a man thinks he has enough to retire is the time he should stay in the harness and accumulate four times as much.

This man's plan failed because he was producing nothing in a period that cost him his dollars many times faster than he had earned them. His plan had worked in America for 100 years—back when people didn't think that society owed them a living.

His plight should make people think; those who care not how little they produce for the dollars they are paid; who loll in serene confidence that the Government will support them.

It is their ilk who ruined this man; they and the self-seeking politicians who want their votes. Inflation is a child of the welfare state, of its waste and the high prices that its taxes create; plus the moral irresponsibility it has engendered among the people, says this man who paid, and knows.

It is a fraud that comfort and security can come from anything but one's labor, he says; that America can survive on anything but the productivity of its people, a swindle that the way to beat the rap is to cheat the boss, revile, and pester him.

Already men are retiring on social-security and old-age pensions to learn the sad facts of this story. Men who didn't plan long enough and big enough on their own; who trusted their fate to government and thought it didn't cost them a cent. Millions will fall for the hoax.

They forget that they are the government and pay the shot, down to the bread they eat; that that's what inflation is. They forget that every day they do not produce more than they consume, another has to do it for them; while they eat up their own future and that of their children.

The humbug cannot go on forever. Some day everybody's future will have been consumed—like the man in this story. Because too many are living off the labor of too few.

Neckyoke Jones Says

EXTENSION OF REMARKS OF

HON. WILLIAM H. HARRISON

OF WYOMING

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. HARRISON of Wyoming. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following column entitled "Neckyoke Jones Says," published in the Sheridan (Wyo.) Press on September 15, 1951:

NECKYOKE JONES SAYS

"Did you seen where the Johnny Bulls is buyin' a millyun bushel of wheat from Uncle Joey Staleen?" I inquires of my ol' pardner, Greasewood. "Yessir," he resloops, "an' I unnerstand that the Brittish is goin' to give raw rubber to Uncle Jo in payment. This will fix it so Uncle Jo kin make tires for airplanes an' sech stuff—which he is givin' to the Chine Commies who is killin' British soljers. Now, I also seen that Clem Atleo—the Sochillist, has told the British folks they don't need to worry about Persian oil, because he's got it fixed to git all the oil they need from your good ol' Uncle Sap. He don't say what the Limeys will use fer money, but you kin bet that it'll most likely have the American eagle on it—because there is a cupple of gimme guys over from England right now negoshatin'. Like as not it won't be long before we'll have to give coupons fer gasoline—an' taxes continues to rise. This seems kinda queer to me—all ol' this here British bizness—but then mebber it's me that's plumb loco." This internashinul bizness has sure got Greasewood euchered. Hopin' you are the same, I am,

Yure fren,

NECKYOKE JONES.

The Charles River

EXTENSION OF REMARKS OF

HON. THOMAS J. LANE

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. LANE. Mr. Speaker, under leave to extend my remarks, I wish to include

the following article from the Christian Science Monitor, Boston, Mass., Saturday, September 22, 1951:

CHARLES RIVER INSPIRES NEW ENGLAND'S WRITERS

(By John Bunker)

BOSTON—The Charles has been a river of writers.

Not a few of the literary greats have lived, worked, and found inspiration along or near its banks. Longfellow wrote a poem to the Charles. Oliver Wendell Holmes gazed from the windows of his Back Bay home out across its tranquil waters—loved to walk along the river to freshen his thoughts.

But more interesting than these and other celebrated men and women of letters are the "unknowns" and the "forgottens" whose prolific literary careers are threads in the Charles River story.

Among the Indian artifacts, spinning wheels, flintlocks, stuffed birds, and assorted other relics which fill the Natick Historical Society rooms at South Natick by the Charles is a collection of books by an author named Horatio Alger.

Youngsters today who can rattle off the names of Dick Tracy, Roy Rogers, Gene Autry, and other heroes of contemporary moppetdom have never heard of Horatio Alger, much less of the intrepid heroes of his pen who thrilled the boys of Dad's day and inspired untold thousands of youngsters with the Alger success formula of "pluck and determination . . . honesty and perseverance."

MORE THAN 100 BOOKS

During his last years, Alger lived with a sister at Natick and spent much time strolling along the river. Ofttimes he was seen sitting under the huge tree where John Eliot preached to the Indians.

Alger was a fabulous character on the American literary scene. Although he turned out more than 100 books in a career of 30 years and was more popular than any of his contemporaries, he has been snubbed by literary critics and historians. Except for Herbert R. Mayes, he has attracted no biographers.

Son of a preacher who held to the strictest of old orthodox religious views, Alger went to Harvard, where his father thwarted the great romance of his life and persuaded him into the ministry.

But his heart wasn't with the preaching profession. When editor William T. Adams published one of his early stories for boys—lauding his style and asking for more—Alger zoomed almost overnight to the heights of writing success.

Magazines that published his stories enjoyed big circulations. His books went into many printings. Fathers counseled children to model their lives after the heroes of his fiction. He made plenty of money, gave it away as fast as he made it, and spent much of his life as resident of a New York newspaper boys' home—to gather local color and help the boys.

Always he dreamed of forsaking his success with boys' books and produce a great novel of immortal proportions. That was in his thoughts when he came to Natick and sought inspection along the banks of the Charles late in his career. The great novel never came because his writing talent was of a different mold, which both reflected and affected the tenor of his life.

COMMEMORATIVE HYMN

The styles of Alger's books are discernible from the titles. Read, borrowed, and reread by the youth of Victorian America were Andy Grant's Pluck, Slow and Sure, Frank and Fearless, Brave and Bold, A Debt of Honor, and dozens of other stories in which his young heroes surmounted in-

numerable obstacles and discouragements to win success and acclaim.

For 14 years his father was pastor of the First Unitarian Church near the Charles River in South Natick. For the church's fiftieth anniversary the elder Alger asked his son to compose a commemorative hymn. Horatio obliged, reading the composition in person. When the reading was over the congregation forgot all rules of decorum and broke out in vociferous applause.

Few of them had probably read Shakespeare, but for all Alger was a household word.

The Charles has inspired considerable poetry.

It incited Thomas C. Amory in 1888 to write a poem of some 350 verses called "Charles River."

The beauty of the Charles stirred James B. Wiggins into composing an unstinted poetic tribute many years ago when the lower waters of the stream were less urban than they now are. But his sentiments still are true of the river in its farther reaches.

"Charles River doth gather its waters forever,

By the green hills of Norfolk 'tis hurrying down,

It gathers its rills and it swells to a river By farm and fair homestead and beautiful town.

Then a song for Charles River,

A mirror forever.

Its beauties and bounties

The pride of three counties.

Its waters are pictures and music to me,

The handsomest river that flows to the sea."

BUSY UNKNOWN

Among the literary "unknowns" who lived and wrote near the Charles were a ministerial trio of Needham amazingly prolific with books on religious subjects—all in the days before typewriters, electric lights, and the other conveniences for literary production.

The Reverend Harvey Newcomb, a Needham minister, turned out no fewer than 178 books as a side line to preaching. One of his works, a 784-page Cyclopedia of Missions had an extensive circulation.

An equally industrious pen was wielded by the Reverend Abijah R. Baker, whose Catechism Tested by the Bible was must reading in his time and sold half a million copies in the 1870's. His wife, Harriette Newell Baker, managed to pen no less than 200 books in addition to her household duties and won an admiring commendation from President Lincoln for the stories she wrote for children.

Busy as these writers must have been, they were matched by the flying pen and prodigious output of William T. Adams, a native of Bellingham by the Charles.

LAUNCHED ON CAREER

Famous in the latter half of the nineteenth century under the pen name of Oliver Optic, author Adams produced 116 full-length novels and some 1,000 magazine and newspaper stories. Along with his writing, he edited two popular children's publications of that period: Our Little Ones, and Student and Schoolmate.

It was Oliver Optic who launched Horatio Alger on his career.

Catering to a boy's love of adventure and at the same time employing the strong moral themes that were expected in books of the Victorian period, Oliver Optic authorized 15 series of action novels, each of which included six or more volumes.

These "unknowns" and "forgottens" of the nineteenth century literary scene, the romantics and satellites, as it were, of that star-filled era of American letters, provide an intriguing and, for would-be authors, an inspiring chapter in the story of the Charles—river of romance.

Address of Lord Mayor of London at Williamsburg, Va.

**EXTENSION OF REMARKS
OF**

HON. J. VAUGHAN GARY

OF VIRGINIA

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. GARY. Mr. Speaker, under leave to extend my remarks in the Record, I include the address which was delivered by the Lord Mayor of London, Sir Denys Lawson, Baronet, in Williamsburg, Va., on Friday, September 14, 1951.

This occasion was the first time a Lord Mayor of London has ever left England while in office to visit the United States. The Lord Mayor, the Lady Mayoress, and the official party were the guests of colonial Williamsburg, which has been restored by Mr. John D. Rockefeller, Jr. The mayors of the capital cities of each of the Original Thirteen Colonies were also guests on this historic occasion. The Lord Mayor spoke from the portico of the restored colonial capitol.

The address follows:

Far more accomplished speakers than I would feel diffident in daring to address you in this city where one of the supreme masters of English oratory, Patrick Henry, delivered one of his most famous speeches; and for me this is perhaps made doubly disconcerting by the reflection that you have invited me, the representative in my own distant city of the authority of the King of England, to speak to you in the very spot which was once the headquarters of Gen. George Washington in his victorious campaign against the garrisons of King George. I hasten to point out, therefore, that my office has not always been identified so closely with the cause of authority. There was among my predecessors as lord mayor of London a certain John Wilkes, whose name is a symbol of liberty in both our countries, and who, in the course of a turbulent but glorious career, was once outlawed and thrice charged with seditious libel. In all honesty, I cannot say that I envy Wilkes all his claims on the interest of posterity. I have never underrated the advantages of friendly relations with the police. There is one occasion in his life, however, which must always have a special place in the historical daydreams of a lord mayor of London, and to which my mind has continually returned as I have passed through this beautiful city, this gracious home of freedom. I mean that memorable day when John Wilkes, as lord mayor, stood before King George III to present the solemn remonstrance of the city livery against the vain and presumptuous policy of attempting to coerce the American people. On that day London, of whose abiding being I am for a briefer moment the immediate embodiment, earned the right, which today I claim, to salute your Nation. And it was John Wilkes also, still as lord mayor, who stood up in the House of Commons to show that even then freedom had a common language on both our sides of the Atlantic. "Have we," he demanded, "any right to tax the Americans? * * * The fundamental laws of human nature, and the principles of the English constitution are equally repugnant to the claim. * * * The words liberty and property, so dear to an Englishman, so pleasing to our ears, would become mockery and insult to an American. * * * The Americans will defend their property and their liberties with the spirit of freemen, with the spirit I hope we should. They

will sooner declare themselves independent, and risk every consequence of such a contest than submit to the yoke which administration is preparing for them."

We did not quarrel over petty matters 200 years ago; the great issues of human governance were at stake; but neither did we quarrel as two united peoples ranged solidly against each other. There were always among us men like Wilkes who knew you were fighting our battle; and there were always among you men who saw beyond the bitterness and strife to the essential unity of aim and belief which inspired two nations cradled in the common law. I am not thinking only of the most obvious achievement; that the struggle represented the birth pangs of your illustrious Republic, which is now the mightiest force working for human advancement in our distracted world. I mean that we too in Britain can now look back upon the issue of the struggle without regret, because, though we lost an empire, we learned also by experience the true principles by which another empire might be held together, until it merges itself into a yet larger and nobler conception. At the second attempt, we found a way to reconcile the liberty of our kindred communities overseas with continued allegiance to the ancient Crown; and a family of sovereign nations has grown up, each absolute mistress of its own affairs, but all trusting one another to come to the aid of the common cause—whenever the liberty of any member of the family is threatened. I have just visited three of the members of this great Commonwealth of Nations, Australia, New Zealand, and Canada. I have found in them all the same deep affection for the mother country and for the people of the United States of America, also for one another; the same unswerving resolution to stand together in defense of peace, liberty, and justice in world affairs; and, not least, the same clear-eyed recognition that the ideals we hold sacred in our Commonwealth are also sacred in your Republic and that the whole future of humanity depends upon the strength and intimacy of the bond that unites us and you. We—American citizens and subjects of the Commonwealth—we are the peoples of the rule of law; and in comparison with that link the fact that our constitutional forms are different and we own no common political authority is of no account.

Here in the Old Dominion we stand in the presence of the most ancient tradition of North America, and I salute that tradition, not merely because it is ancient, but because any American tradition which goes back to 1633, when this city was founded under the name of the Middle Plantation, is necessarily one that my country may claim to share. The great tides of mingled political and religious controversy, which is the seventeenth century swept England, and out of whose interaction our modern system of parliamentary government arose, swept Virginia also. Your Governor and two houses of the colonial legislature exactly reflected the King, Lords and Commons of England; there were the same stresses between them, and the rival conceptions of political philosophy had very similar ups and downs.

At the end of the century when our struggle in England issued in the compromise we call constitutional monarchy, you renamed your city after the same King William whom we in the city of London remember as the founder of our most famous and powerful institution, the Bank of England. Your college of William and Mary has been since 1693 a brilliant member of that international republic of learning which, I am glad to say, has never been dissolved by the disputes of politicians, and is the perpetual interpreter of the common heritage of the English-speaking nations. It was with profound emotion—what man with any historic sense could fail to be moved—that I took my place in the procession this afternoon from your court

house of 1770 and saw the state sword of the corporation of London, itself dating from 1690 and our ancient symbol of justice, beside the civic mace of Williamsburg to the capitol. I was no less touched to sit down at luncheon with the representatives of capital cities from all the 18 States on whose original compact your Nation was founded, and to be accepted as a brother mayor among all those mayors of proud and honorable lineage. Here, I thought, is the thing that nothing can alter in the much dispersed family to which we all belong—the self-government of English-speaking men in cities. The love of our own home town is the beginning of the love of our country, which again must be deep and true before we can rise to the love of humanity; and it is by learning the art of governance on the smaller stage of civic affairs that a people becomes fit for the heavy responsibility of controlling its own destiny and may hope to point the way to what we all dream of, the parliament of man, the federation of the world. So, gentlemen, it is in this gathering of municipal officers, carrying the same sort of emblems because they still do the same sort of work on both sides of the Atlantic, that I find the most hopeful and encouraging sign that the American way of life and the British way of life fit together in a natural harmony. We are the peoples that build upwards from the level of the common man and work-a-day affairs. We believe that all authority must be in touch with the small things, the human things, from which comes its life. We stand inflexibly together against the opposite doctrine, that the rights and liberties of men are concessions made to them by exalted power, not answerable to them, but dispensing or withholding indulgences according to its arbitrary will. I do not need to remind you that we are confronted by vast communities in the modern world who do construct their politics thus, from the top downwards, and even believe that the rights they thus derive may be legitimately called liberty. With great price they buy that freedom—the price of surrendering the mastery of their soul. But we—we who through all the ages have been governing ourselves in parish meeting or town council, till out of these humble beginnings came Parliaments and Congresses—we were born free.

So long as we retain our unity, we shall, with God's help, defend and enhance our common heritage of true freedom.

Welcome—To Jail

**EXTENSION OF REMARKS
OF**

HON. FRANK E. SMITH

OF MISSISSIPPI

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. SMITH of Mississippi. Mr. Speaker, under unanimous consent, I include the following editorial from the Christian Science Monitor:

WELCOME—TO JAIL

Americans read with elation of the number of persons who brave the dangers of the iron curtain to escape from Communist-dominated lands to supposed freedom in Western Europe. Yet a correspondent in Geneva points out that under present circumstances the first thing that happens to probably more than two out of three of these escapees is that they are thrown into jail like common criminals.

A few of them are fugitives from punishment for ordinary crimes. Certain others may be spies. But most of them are ordinary workers, some are trained technicians, some

farmers; all have information and an evident distaste for communism.

All are guilty, technically, of having crossed a border illegally. Hence the prospect of jail if they report to or are found by officials in the American-occupied zones. There they are questioned by military intelligence officers and eventually turned out to try to find a living.

A number of things could be done to improve this situation. First, there should be a less degrading kind of detention instead of jail while the escapees are being screened. Second, there should be a uniform procedure in the various districts along the frontier. Third, there should be some organization or organizations which can assist those who are worthy among these refugees to become placed where they can support themselves, serve society, and aid the free cause.

The International Refugee Organization, which dealt with the displaced persons problem after the war, is being dissolved. There is need for a new agency of this type to give iron-curtain refugees a better introduction to the West. The Iron Curtain Refugee Campaign conducted by the International Rescue Committee is doing a much-needed job in this respect so far as privately contributed resources can go. But the job is bigger than that.

It requires official attention and ultimately congressional support in such matters as finances, modification of immigration laws, and possibly authorization of a larger number of foreign enlistments in the armed services. The United States is missing an enormously important opportunity in the cold war if it does not arrange for better treatment of those who risk shooting by the border guards in order to come over to the anti-Communist side.

Tax Aid in Home Sales

EXTENSION OF REMARKS OF

HON. S. J. CRUMPACKER, JR.
OF INDIANA

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. CRUMPACKER. Mr. Speaker, under leave granted to extend my remarks in the RECORD, I include the following article from the United States News and World Report of September 21, 1951:

WE'VE BEEN ASKED ABOUT TAX AID IN HOME SALES

What tax changes is Congress making that affects home owners?

Tax laws are to be changed so that profit from sale of a home will not be treated as a capital gain, provided the seller turns around and buys another home, costing as much or more than he got for the old house, within a year.

Is that assured?

Yes, it seems to be. The House has voted in favor of it in the new tax bill. The Senate Finance Committee agrees. There is little or no opposition.

What does this mean?

Under the coming tax law, if you own a home and sell it at a profit, the profit will not be taxed provided you buy or build another home of the same or greater value. In the past, the tax has discouraged many people from selling and building or buying again. If they sold, then they were taxed up to a 25-percent maximum of the profit from the sale. Most old houses offer a profit because they were built before the big price rises. But, because of higher prices, a new house usually costs at least as much as the

return from an old one. So the home owner, under the old rule, doesn't come out as well as it appears on paper. For part of his profit goes for taxes.

What will be the effect of the change?

One effect might be that more old houses will be offered for sale, with sellers then being in the market for newer homes.

Will the tax change apply in all cases?

No. To take advantage of this tax change, the home that is sold must have been the principal residence of the seller. And the house that is bought must be used as his main residence. Thus, the savings on capital-gains tax will not apply to rental houses. There, the profit would still be taxed.

Suppose the new house costs less than the old one?

Then a tax would have to be paid on part of the profit. Suppose, for example, that you bought a house for \$12,000 in 1940 and sell it now for \$20,000. If you buy a new home for \$20,000 or more, you would not have to pay a tax on your profit. But, if the new house cost \$16,000, you would have to pay a capital-gains tax on the \$4,000 of the profit that is not applied to the new house's cost.

Is the rule the same when a new home is built?

Construction of the new home must start within 1 year of the sale of the old one for the tax advantage to apply. But the builder is given 18 months after sale of the old house to move into the new one. All building costs during that 18-month period count toward the purchase price of the new home.

What if a new home is bought before the old one is sold?

It works the same there. The new tax provision applies so long as the new home is bought 12 months before or after sale of the old house.

Does the tax change apply to past sales, too?

As now written in the tax bill, the change would apply only to the sales of homes made on or after January 1, 1951. If, for example, you sold your house on January 15 of this year, you would get the benefit of the new rule by the purchase of a new house any time between January 15, 1950, and January 15, 1952.

What is included in the cost of a new home?

In general, that means the purchase price, including mortgages and other indebtedness that the buyer assumes, and the cost of improvements and additions paid for by the buyer. Commissions and other purchasing expenses paid by the buyer also are included in the cost of the new house. But, in figuring the selling price of an old home, no deductions may be made for commissions and other selling expenses, as the new tax bill now stands. Adoption of this new capital-gains-tax rule by Congress will wipe out one important objection that many persons have to selling their old homes and buying new ones. Estimates are that the Government will lose in taxes about \$112,000,000 a year by the change.

Advancing Free Enterprise

EXTENSION OF REMARKS OF

HON. EMANUEL CELLER

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Thursday, August 16, 1951

Mr. CELLER. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following address delivered by me before the National Security Industrial Association, Waldorf-Astoria Hotel, New York City, September 26, 1951:

As chairman of a congressional subcommittee which during the past 2 years has been probing into the ramifications of the growth of monopoly power in various segments of the economy, it is appropriate that I address my remarks tonight to some of the consequences of as well as the solutions to the problem of undue concentration of economic power as they affect the distribution of the procurement dollar. While many of you represent large and important industrial concerns, it is my hope that you will hear with me in this discussion, for I assure you wholeheartedly that our interests are one in preserving our competitive system and advancing free and private enterprise. I believe, too, that we can both go far toward this end if we examine dispassionately the economic structure of our present industrial society and postulate our mutual objectives with clarity.

In the first part of my statement I point to the great growth of industrial concentration in our economy and that it bodes ill. In the latter part of my statement I offer a remedy whereby great industrial entities might divest themselves of or "spin off" some of their subsidiaries without prohibitive taxation. The remedy is a voluntary one. There are no sanctions, no coercion, no death sentence.

I think we can all agree that one of the biggest factors in America's large productive capacity, her mechanical ingenuity, and her inventive genius has been the unlimited opportunity afforded by a free and competitive market. When, however, this competitive market shows signs of stricture within its four corners, when the race of competition slows down to a mere procession trailing faithfully behind a leader, or when competitive adversaries have unfurled the white flag of a negotiated truce, there arise serious implications to the advancement of a free-enterprise society. Accordingly, it is with a high degree of alarm that one really interested in the maintenance of competition and the equitable division of military orders views the economic phenomenon recurring again and again in various segments of the economy. Let me illustrate what I am referring to by turning to several concrete examples.

In the field of soap four companies account for almost 80 percent of the output in the industry. In the manufacture and sale of rubber tires and tubes Goodyear, Firestone, United States Rubber, and B. F. Goodrich, the four largest rubber companies, account for more than 75 percent of the value of shipments in the entire industry. Four corporations mine 80 percent of the value of all primary copper produced in the United States. Industry after industry can be named which is under the hegemony of a big three or a big four: Liquor, aluminum, steel, tin cans, meat, cigarettes, glass—to only name a few. A report prepared for the Subcommittee on Study of Monopoly Power at my request by the Secretary of Commerce indicated that in some 150 different industries 4 companies control more than 50 percent of the industry's output.

How difficult it is for competition to exist and for small business to share in the procurement dollar where the industrial structure has become rigidified to the extent that a few large concerns dominate the industry as a whole. Experience in antitrust cases has shown that the predominant concerns themselves soon recognize that their best interests lie in forsaking price competition and in acting in harmony and in union. In the tobacco industry, for example, while the big three tobacco companies charged identical prices for only about one-third of the time during the 7 years immediately following the accession of Lucky Strike to the competitive scene, the practice of price competition was soon completely abandoned. As Drs. Stocking and Watkins observed in their book recently published

under the auspices of the Twentieth Century Fund entitled "Monopoly and Free Enterprise":

"But, as has frequently happened in other fields, the leaders of the industry soon learned that price competition as a matter of tactics did not pay. Reynolds' rivals apparently recognized that its newly achieved preeminence in the industry was no passing phenomenon. And the big three apparently realizing that their separate interests were dependent on their collective welfare and that a prolonged price war presaged mutual defeat and frustration. They accordingly concluded they could best promote their several interests by charging identical prices in accordance with the price leadership principle."

So frequently has price leadership replaced price competition throughout much of American industry that the charging of identical prices has now been elevated in business parlance to the status of "meeting competition" in order to disguise the true nature of the phenomenon.

If, in markets which have become dominated by a small coterie of industrial concerns, there is a dearth of competition among industry leaders, it is even more probable that smaller companies will become mere satellites of their more powerful brethren. In the electric lamp industry, for example, a court only a short time ago concluded that "General Electric has at least the power to intimidate other businesses from selling their products to purchasers who might compete with it." In the cement industry, the Government, in a recent proceeding under the antitrust laws, proved that the large cement companies had sold cement in recalcitrant price cutters' sales territory at such low price levels that the dissident companies were compelled to restore their prices to orthodox levels. With these and other striking examples confronting them, it is today almost foolhardy for a small, independent company to challenge the avowed policies of the market leaders, whether in the field of military procurement or otherwise.

The situation facing potential newcomers in these industries is frequently even more precarious. In the production of titanium pigments used in the manufacture of paints, former United States District Judge Rifkind recently indicated in the National Lead case that "It was more difficult for the independent outsider to enter this business than for a camel to make its proverbial passage through the eye of a needle." In the aluminum industry, it was only by dint of prolonged Government efforts that two new competitors to the giant Aluminum Company of America were established in business at the end of World War II.

Additional elements in today's industrial structure threaten to blunt even further the impetus toward real competition and to prevent the just distribution of procurement orders. Through large-scale vertical integration, the power of many companies has become enhanced, not only in their own industries, but in fields hitherto occupied by their customers. Thus, some 17,000 independent fabricators of aluminum and aluminum products are dependent for their raw materials almost entirely upon Alcoa, Reynolds, and Kaiser companies which themselves own and operate fabricating facilities with capacities far in excess of their rawingot production. In the manufacture of steel products, the most pressing problems facing the stamping industry, according to Tom Smith, president of the Pressed Metal Institute, "is the accelerated encroachment through subsidiary organizations of a majority of metal producers into the stamping business." So far have the major steel companies preempted the steel barrel and drum business that the September 1944 issue of Iron Age, in commenting upon the fact that some 87 percent of the entire barrel and drum business had been corralled by the

steel mills, contrasted the present plight of the industry with its status prior to 1939 when the barrel industry was "a rather volatile business firmly in the hands of a large number of highly individualistic entrepreneurs. Most of these fabricators had started on a precarious shoestring and were justifiably vocal in their pride of success in the classical Horatio Alger, pluck-and-luck traditions."

Many large concerns have also branched out into entirely unrelated fields of endeavor where there exists little logical basis for their operations. The Bordon Co., as a prominent instance, is engaged in the sardine and fish-oil business, the pharmaceutical business, and in producing pet foods and plastic materials. Manufacturers of distilled spirits have become owners of breweries and producers of pharmaceuticals. The great United States Steel Corp. is in the steamship business, operates a water company and cement plants, and manufactures prefabricated houses, while the Bethlehem Steel Co. operates a shipyard in New York Harbor.

To those who have perchance leveled criticism at this alarming tendency for a few companies to dominate an entire industry, to replace competition with cooperation, over, or subsilento, and to integrate forward, backward, and into alien fields, has come the heated reply that these activities have resulted from the trend toward economic efficiency. If the price of efficiency, however, is the demise of free enterprise and a competitive system, then all the principles upon which this economy of ours has been operating since its inception have been grossly in error. I suspect, however, that the persistent claim of increased efficiency derives from an effort to confuse and obscure the true issues.

Certainly there exists no better evidence for dispelling the notion that the growth of economic concentration has had as its companion the increase in economic efficiency than a report prepared by the industrial engineering firm of Ford, Bacon & Davis after a detailed and prodigious scrutiny of the United States Steel Corp. Dr. George Stocking, testifying before the Subcommittee on Study of Monopoly Power in May of 1950, pointed out that these consulting engineers found United States Steel "was slow in introducing the continuous rolling mill; slow in getting into production of cold rolled steel products; slow in recognizing the potentials of the wire business; slow to adopt the heat-treating process for the production of sheets; slow in getting into stainless steel products; slow in producing cold-rolled sheets; slow in tin-plate development; slow in utilizing waste gases; slow in utilizing low-cost water transportation because of its consideration for the railroads; in short, slow to grasp the remarkable business opportunities that a dynamic America offered it. The corporation was apparently a follower, not a leader, in industrial efficiency."

Doctor Stocking further characterized the contents of this report as "the most devastating indictment by experts of big business on the charge of inefficiency that has ever been made public."

There can be little doubt that the economic factors which I have discussed have tended to dull competitive forces. More and more, decisions relating to price and production policies of industry are being determined not by the competitive forum of the market place but by the large concerns which themselves dominate the market. Competition among these huge entities has become illusory, competition from smaller organizations has been all but stilled.

These factors have greatly disturbed me ever since the Subcommittee on Study of Monopoly Power undertook its intensive investigation of the concentration of economic power. I also know that they have alarmed many of you who are seriously interested in advancing free enterprise. At a conference

held under the auspices of the United States Chamber of Commerce in Chicago last June, for example, Clarence Randall, President of the Inland Steel Co., made some pungent comments relating to the dependency of a free-enterprise system upon a truly competitive market place. Mr. Randall's cogent remarks, which were printed in full in the September issue of the Atlantic Monthly, are so frank and candid that I am taking the liberty of reading a lengthy excerpt from them this afternoon. Said Mr. Randall, and I quote:

"But the free-enterprise system isn't just a 'hunting license.' It carries with it its obligations; and on that I hear talked about less and would like to hear talked about more—and frankly and openly—is that the free-enterprise system must be policed by a free market.

"Free enterprise has a tendency to make each of us selfish. We are held on the beam toward the protection of the public welfare by honest, direct, vital, real competition; and any man who directly or indirectly, by private agreement or private understanding, attempts to limit the free market for his goods is asking for nationalization."

"If you want to bring on the end of free enterprise," Randall warned, "just continue to take part in the limitation of free markets. We can't have the benefits and not accept the responsibilities. We have to play the game honestly with regard to the free market."

What I have said this afternoon, I have not spoken in a critical manner. I do not blame anyone, nor do I accuse anyone of any wrongdoing. I am merely calling attention to a state of facts and to an economic situation in which we are, at the moment, inextricably bound.

I say that it is no wonder that the procurement dollar has gone mainly to a few large concerns. Faced with the economic organization that exists, it is not strange that military procurement statistics reflect the economic organization of the country as a whole. It is extremely disturbing to realize that since the start of the Korean war 10 large manufacturing concerns have handled 40 percent of the total dollar volume of defense contracts and that 50 companies alone have obtained practically two-thirds of the dollar volume of defense contracts. This is but a repetition of the phenomenon which occurred in World War II, when 10 large companies secured 30 percent of the dollar volume of war contracts and 100 companies about two-thirds. While it is imperative that military procurement officials do everything in their power to rectify the distortion which is reflected in these statistics, and distribute the good gospel of procurement equitably to all businesses, one must be chary of placing too much blame upon defense officials who are confronted with an economic structure over which they have no control.

I know many of you wish that practicable solutions could be found whereby the complex economic structure of many corporations could be satisfactorily dissipated and effective competition restored to stagnant markets. I have spoken to numerous operators of large entities whose organizations are highly integrated, and they have told me in confidence "We'd like to truncate some of our operations or branches, but how can we do it without great loss to our stockholders?" They dare not admit this in public, as it might be a sign that they had made a mistake in gathering unto themselves all these operations, in the first instance. What they want is feasible legislative remedies for the economic quandry in which they now find themselves.

While at the present time many legislative solutions for the undue concentration of economic power are still under careful study, I believe that inducing voluntary cor-

porate simplifications by means of sound tax legislation may provide at least a partial answer.

The present revenue bill, as it is now under consideration in the Senate, would permit voluntary divorcement of corporate subsidiaries through corporate reorganization and a division of stock among the shareholders of the parent corporation without subjecting such stock to immediate and prohibitive taxation.

While there are certain areas which need clarification in the bill as presently drawn, I certainly endorse the principle enunciated by this proposed statute.

It is imperative that all Federal legislation be consonant with the objectives of the anti-trust laws. This is especially true in the field of taxation. For example, at the present time, the Department of Justice is prosecuting a suit to require the du Pont Co. to dispose of its stock in the General Motors Corp. Had du Pont sought to divest itself of this stock voluntarily the distribution of stock would have been subject to severe taxation and consequent loss. The situation is therefore incongruous. There are probably many similar examples where a corporation might be anxious to dispose of its interests and yet be deterred because of the applicability of the internal-revenue laws.

Whether the bill as it is being considered in the Senate will cover the du Pont situation which I have used as an illustration I do not know because the bill is not clear in all respects. However, it will encompass many instances where it is highly desirable that large entities simplify their corporate structure and divest themselves of integrated and conglomerate subsidiaries.

A program of corporate reorganization involving the combination or integration of smaller corporate units into one large corporation can be readily accomplished on a tax-free basis under existing provisions of the Internal Revenue Code. A corporate reorganization may, however, be equally necessary to effect the division of a large corporation into smaller units. Except in situations falling under the Public Utility Holding Company Act, existing provisions of the code make it cumbersome, if not impossible, to achieve this result without prohibitive tax consequences. The proposed amendment would liberalize sections 112 and 113 of the code to facilitate the division of large corporate organizations into smaller units without recognition of taxable gain to stockholders.

The proposed amendment affords to corporations generally the exemption now accorded to public utilities under supplement R of the code (secs. 371-373, 371(c) in particular). Supplement R was enacted in 1938, as a complement to the Public Utility Holding Company Act, to facilitate the process of break-up of huge concentrations of wealth and power in the national utilities. Experience had under this act has been eminently successful. While bitterly opposed at its inception, it is today almost universally agreed that the Public Utility Holding Company Act procedures for corporate simplification have benefited all concerned. Stockholders who obtained securities in corporations which were divorced from the parent corporation have had their assets enhanced. Corporations which simplified their organization have operated more efficiently and profitably. The public has obtained lower rates for its utility services.

The economic disadvantages of concentrations of industrial wealth are no less serious than in the field of utilities and present a constant national problem. Our antitrust laws are a partial safeguard against corporate combinations where monopolistic practices are involved. By the same token, legislation which removes obstacles in the way of voluntary corporate reorganizations,

designed to subdivide a large industrial organization into smaller units, is economically desirable. The proposed amendment removes the obstacle of prohibitive taxation in such corporate reorganizations.

The proposed amendment will not result in loss of revenue to the Government. The distribution of stock in the reorganization will not enable untaxed distribution of the earnings and profits of the distributing corporation, but such earnings and profits are divided between the smaller units emerging from the reorganization and are taxed to stockholders when distributed.

What I have said this afternoon is most important in the long-run picture of military procurement as well as in the general operations of the civilian economy. We must give procurement officials a competitive economy in which to obtain their purchases. Not only will this result in the fair and equitable distribution of procurement orders but it will advance what we are all really fighting to preserve—a free enterprise system.

National Outlawing of the Communist Party

EXTENSION OF REMARKS OF

HON. THOMAS J. LANE

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. LANE. Mr. Speaker, under leave to extend my remarks, I wish to include the following article from the National Tribune, the Stars and Stripes, Thursday, September 27, 1951:

NOBODY SEEMS TO BE HOME

This veterans' spokesman has carried on an unending effort to have the Congress outlaw the Communist Party in the United States as a group organized in a conspiracy to overthrow the country's legal government by the use of force and violence. As time has gone by, most of the major veterans' organizations have come around to our way of thinking. Although the Congress has failed to give the problem much thought and indeed, as some Government officials have given aid to the conspirators by trying to sell our sovereignty down the river through other means, there is yet a heartening reply to our campaign.

In Massachusetts and in other States that have already enacted or have pending resolutions the enactment of which would outlaw Red Party members, there has been a notable lack of Communist activity. Some say that the Reds have gone underground. Others insist that the Comms have cleared out to find more fertile fields of endeavor, but a Nation-wide survey by the Federal Bureau of Investigation gives some of the answers and they all sum up to the fact that if you fight demons hard enough, they will return to the depths whence they came.

In Boston the party has apparently closed up shop, and as nearly as can be determined, open activities have ended for the Communists in Louisiana, Alabama, North Carolina, Georgia, and Virginia. Investigation discloses that while offices have been maintained nominally in Florida, the District of Columbia, Maryland, Connecticut, Illinois, Pennsylvania, and Washington, telephones have either been disconnected or there is nobody around regularly to answer them. But perhaps of greater significance is the fact that Commie national headquarters in New York City has had to move its business from fairly large offices at 35 East Twelfth Street

to a little room on the fifth floor at 29 West One Hundred and Twenty-fifth Street, apparently for want of funds to maintain more elaborate quarters.

Party leaders are said to have admitted their trials in attempting to keep their heads above water. They have been harassed, they say, and have been denied the right to accommodations where mass meetings can be held and funds can be collected. Party work has had to be curtailed and economies practiced. Much subdued, the Reds are in bad financial straits. Things have been made so tough for them that they cannot operate.

No stronger argument for the national outlawing of the Communist Party can be made than this FBI survey. All that is needed is for Congressmen to recognize the difference between liberty and conspiracy and then have courage enough to clamp down the lid upon a terrible evil.

The Seventh Congressional District of Alabama Has 13 Percent of the Forest Lands of Alabama, and in 1950 Had 13 Percent of the Forest Fires of Alabama, and Approximately 13 Percent of the Timber Area Burned in Alabama

EXTENSION OF REMARKS OF

HON. CARL ELLIOTT

OF ALABAMA

IN THE HOUSE OF REPRESENTATIVES

Friday, September 14, 1951

Mr. ELLIOTT. Mr. Speaker, the past 10 years have seen what a generation ago would have been an undreamed of drain on our natural resources, including our forests. The end is not in sight.

Present demands on our resources make it imperative that we become more conservation-minded.

Forestry is a major concern of Alabamians. It is one of our major industries, one of our major crops.

Our Alabama forests are today being recognized more than ever before as a major source of the wealth of our people. The new School of Forestry at the Alabama Polytechnic Institute at Auburn, Ala., is a recognition of that fact.

The recent session of the Alabama Legislature appropriated money to establish a new tree seedlings farm to furnish the demand of Alabama timber growers for additional baby trees with which to replant and reforest some of Alabama's vacant acres.

Fire is, of course, one of the greatest enemies of our forests. It is an enemy which stalks our woodlands almost entirely as a result of human carelessness.

The Division of Forestry of the Department of Conservation of the State of Alabama is charged with the duty of protecting the forests of Alabama from fires, within the limits of its authority, and within the limits of its appropriation to provide such protection. Its report for the calendar year 1950 shows that Alabama forests suffered 9,947 destructive forest fires, each of which burned on the average of approximately 42 acres of forest lands, for a total of 415,826 acres.

Cleburne County had the largest percentage of its total forest acreage

burned, the percentage being 6.37 percent of 196,528 protected acres or 12,523 acres. Its 114 fires each averaged destroying 110 acres of forest lands.

On the other hand, Limestone County with 81,716 protected acres had only one fire and it burned only 14 acres, thus to

give Limestone County the best record in the State in 1950.

Crenshaw County had the largest individual fires in the State. Its 88 fires destroyed an average of 139 acres each.

Mobile County had the largest acreage destroyed by fire—35,461 acres.

Escambia County had 731 destructive forest fires to give it first place in that regard.

At this point, I insert a table prepared by the State Division of Forestry of Alabama for 1950 which substantiates the conclusions I have set forth:

State of Alabama, division of forestry, department of conservation—monthly fire report by forest ranger districts, December 1950

District	Ranger district	County	This month			To date				
			Number of fires	Area burned	Average size	Number of fires	Area burned	Average size	Area protected	Percent burned
1	13	Cherokee	5	133.9	26.8	36	669.6	18.6	197,200	0.31
1	28	De Kalb	8	325.0	40.6	55	1,880.5	34.4	280,800	.75

12	65	Washington	3	145.5	48.5	185	22,609.6	122.2	611,200	3.71
Total			945	31,078.2	32.9	9,047	415,826.1	41.8	18,044,933	2.50

The Seventh Congressional District of Alabama has 13.1 percent of all the forest lands of Alabama—2,389,027 acres out of 18,044,938 acres.

In 1950 it had 13.6 percent of all the forest fires of Alabama, or 1,352 out of the total 9,947.

In 1950, 12.3 percent of the forest-fire destruction in Alabama was in the Seventh District—51,183 out of 415,826 acres destroyed by fire.

Thus the number of forest fires, and their destructiveness, in the Seventh District was within 1 percentage point of the State averages, to make the Seventh District what we might term average in these respects.

State Aid Granted to Catholic Schools

EXTENSION OF REMARKS

OF

HON. THOMAS J. LANE

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. LANE. Mr. Speaker, under leave to extend my remarks, I wish to include the following article from the *Christian Science Monitor*, Saturday, September 22, 1951:

STATE AID GRANTED TO ROMAN CATHOLIC SCHOOLS IN FRANCE

(By Reuters)

PARIS—The French National Assembly has passed two bills granting state financial aid to Roman Catholic private schools.

This was a victory for Premier René Pleven's month-old government which has been fighting to subsidize private schools despite fierce opposition from Communists and Socialists. Until now it has always been a general principle of the French Republic not to finance private schools.

First bill—passed at its second reading by 378 votes to 236 within a few hours after its successful passage through the Senate—enables students at private primary schools to benefit from state high-school scholarships. It was a Government-sponsored bill.

The Assembly has voted 327-259 to pass a private member's bill indirectly subsidizing private schools. The bill, sponsored by Roman Catholics, Gaullists, Conservatives, and some radicals, awards an annual subsidy of about \$18 for every child between 6 and 14 years old.

Parents can choose whether the subsidy should be used to educate their children in either state or private schools.

The subsidization will cost the state \$420,000,000 a year.

Soil Conservation Is Good Business

EXTENSION OF REMARKS

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following address by H. H. Bennett, Chief, United States Soil Conservation Service before the Kiwanis Club luncheon, Aurora, Ill., June 13, 1950:

SOIL CONSERVATION IS GOOD BUSINESS

It always gives me great satisfaction to have the opportunity of talking about soil and water conservation with business and professional people like you members of the Aurora Kiwanis Club.

Being engaged, as you are, in every-day, practical matters concerning the community, you are naturally interested in the solid facts and figures on this or any other undertaking that has to do with community betterment and with State or national welfare. As a practical soil conservationist, I likewise am concerned with facts—not with theories or guesswork—about the vitally important business of safeguarding our basic soil and water resources while we make profitable use of them.

There are some, perhaps, who feel that only farmers need be interested in soil conservation; but it's my conviction we should all be very deeply interested, whether we live in the greater Chicago area, in Dallas, Tex., or elsewhere. Modern soil conservation farming is not limited in its effects and benefits just to the farms on which it is practiced. It is closely related to the profitability of industry, the well-being of municipalities, and the health and welfare of all the people.

I believe I can say that our national policy and public thinking, with few exceptions, are agreed on the utter necessity of conserving our interlocking resources of land, water, forest, grass, cultivated crops, and wildlife. Research, education, land inventories, and the successful use and profitable results of soil conservation have brought us to a new concept of the importance of land and, also, of the need for keeping the land permanently productive. The practical application of this concept is being demonstrated on a progressively wider scale from year to year, in Illinois, here in Kane County, and all over the Nation, by farmers in soil-conservation districts, striking at the root of the evil with the technical assistance of the Soil Conservation Service. This modern, democratic approach, by enlisting the cooperative effort of landholder, Government, and the public together, is proving beneficial to individuals and the public alike.

PRODUCTIVE LAND'S IMPORTANCE IN OUR ECONOMY

It would be most convenient for the rest of us if we could pass all the responsibility for soil conservation back to the farmer—

the Illinois or Iowa corn farmer, the Kansas wheat grower, the Texas cattleman, or the Alabama cotton grower—and let the matter rest there. But our economy isn't built that way. The land is still the source of a very large share of our original wealth. Manufacturers, bankers, storekeepers, doctors, teachers, ministers, writers, and all the rest of us, in Chicago, Aurora, Dallas, are directly affected by what happens to the base of that land wealth—our productive land. We are affected, basically, as consumers of the things that are produced from the land; and we are affected, also, with respect to our income. Some, even, are affected through malnutrition arising from lack of good land in some places for the production of nutritious food.

The importance of productive land in our economy hardly can be overemphasized. A suit of clothes or a pair of shoes is manufactured here in the Chicago area, but the wool or leather which goes into the finished product probably was produced on a western ranch, perhaps 1,600 miles away. And many people, beginning with the rancher himself, are dependent wholly or partially for their income—their living—on the processes involved in getting that suit of clothes or pair of shoes into your clothes closet or mine. There are railroad men and truckers, weavers, leather workers, advertising men, stenographers, bankers, package manufacturers, salesmen, wholesalers, retailers, and many more. I hardly need to go into detail for you who live and do business here in one of the greatest wholesale and shipping centers of the Nation or the world.

The same situation is true of every package of bacon, piece of furniture, or other item processed or manufactured in the great plants of this business area. These producers, processors, and distributors are, in turn, buyers of goods and services on their own account. They patronize doctors, dentists, lawyers, garden supply shops, and nurseries; barber shops and beauty parlors. They go to the movies and ball games. They buy houses, automobiles, radios, television sets, newspapers, electric irons, and light bulbs. They ride on Pullman cars. They hunt and fish, play golf, and take pictures. Their taxes help to build roads and bridges, ships and airplanes.

AMOUNT OF PRODUCTIVE LAND IS LIMITED

So it is that every interest in the country has a stake in getting the quickest possible solution to this problem of safeguarding our remaining productive land—which is the source of all but a small fraction of our food, as well as of all our wood products, leather, wool, vegetable fibers and oils, and many other things. Although we in this country are not in danger of going hungry any time soon because of our land's running out, the amount of productive land we have left is much more limited than is commonly supposed. I realize that is a fact which may be a little hard to appreciate, out here in your fertile prairie farm belt, with something like 85 percent of your Illinois area composed of farm land.

But the fact remains that we have left in the United States as a whole only about 460,000,000 acres of good, first-class land, counting all the good land that is in cultivation now and all that can be brought into cultivation by presently feasible means. In recent years, we have been using for crop production and rotational pasture around 350 to 400 million acres annually. Something over 70,000,000 acres of this farmed area, however, is unfavorable for use as cropland and should be diverted permanently to grass or trees. All but about 100,000,000 acres of the 460,000,000 acres of good, productive land, in use or available, is or would be, without protection, susceptible to severe damage by erosion, waterlogging, and floods.

Illinois is exceptionally well off from the standpoint of its area of arable land. Our

capability survey shows that more than 65 percent of the State's land falls in classes I, II, and III—land which is suitable for continuous cultivation, with careful conservation treatment of classes II and III lands. Fifteen percent consists of class IV, a borderline grade which can be cultivated safely only occasionally, and about 20 percent consists of classes V, VI, and VII, land suited only to growing grass or trees.

Yet erosion has been severe on a million acres of Illinois farmland and serious erosion has occurred on around 35 percent. This means that, altogether, more than 14,000,000 acres have been either seriously or severely damaged in Illinois. I myself have been seriously disappointed when I have traveled across northern Illinois—where the land is commonly described as flat as a table top—and have observed the hundreds of tons of fertile soil being carried by winter rains from the bare and unprotected surface of almost imperceptible slopes, when it would have been so easy to prevent this loss by growing winter cover crops on these cultivated fields.

DOING SOMETHING ABOUT LAND WASTAGE

Because eroded land is scattered around somewhat—a gullied field here, a sheet-eroded slope there—we sometimes are inclined to overlook what is happening to our productive land, and to discount its importance. But with good land like yours, worth from \$125 an acre up, 14,000,000 acres seriously or severely damaged brings us to a couple of billion dollars worth of Illinois farm land that's wastefully depreciated. What would happen, I wonder, if anything like that kind of preventable damage and depreciation were eating away at your industrial plants and stores, your machinery, buildings, railways, and so on? You would do something about it; that's what would happen most certainly, especially if the damage should get worse and spread more and more, like erosion damage does with every rain where land is not protected.

And for precisely the same reason—because it's good business to protect and prolong the productive life of the soil on which our biggest business of agriculture depends—we are doing something to halt the dissipation of our irreplaceable soil. We are doing it—Nation-wide and State-wide, community by community, farm by farm—through modern conservation farming.

Today you will find this relatively new but already tried and true kind of farming in constantly wider use as far as United States land extends in any direction, from right here in Kane County, Ill., northwest to Alaska, northeast to Maine, southeast to Puerto Rico and the Virgin Islands, and southwest to Hawaii. I am talking about soil and water conservation farming which landholders of the Nation are carrying on themselves through their farmer-organized and farmer-managed soil conservation districts, with the technical help of the Soil Conservation Service and the support and assistance they draw from various other sources, governmental and private. And now many other countries also are adopting this conservation pattern in their agriculture.

WHAT MODERN SOIL CONSERVATION IS

Before we look further into the progress of conservation farming, in Illinois and elsewhere, I think we should stop a moment and see what we mean when we talk about modern soil conservation.

Modern soil conservation consists of the kind of sound land use and protection needed to keep the land permanently productive while in use. It means terracing land that needs terracing; and contouring, strip-cropping, and stubble-mulching the land as needed, along with supporting practices of crop rotations, cover crops, green-manuring crops, and so forth, whenever needed. It means gully control, stabilizing

water outlets, building farm ponds, locating farm roads and fences as nearly on the contour as practicable, planting steep, erodible land to grass or trees, development of good pastures, and devoting good management to them after they have been developed.

Where land is too wet, modern soil conservation calls, moreover, for drainage, with full consideration given to wildlife needs; if it is too dry, it calls for irrigation, if it is subject to wind erosion, it calls for wind-stripping, tree planting, growing cover crops, and stubble-mulch farming. If plant nutrients, lime, and the humus supply of the soil have been depleted, it calls for fertilization and addition of lime and organic matter; if water-soluble salts have accumulated in toxic quantities, as in parts of the West, it calls for both drainage and leaching out of the salts by flooding. And modern soil conservation calls also for the use of the best of the most adaptable varieties of crops as well as the most efficient of adaptable tools available to farmers.

Modern soil conservation likewise calls for flood control and reservoir protection (municipal and other kinds) by treatment of whole watersheds with the right combinations of practices, land use, and small structures in the smaller, upper watersheds where flood waters start. Applied at the right time and place, such watershed treatment saves soil and reduces flood and sedimentation damage, stores water in the soil for plant use and where conditions are favorable, in the underground strata for pumping.

And, of course, an indispensable part of modern soil conservation is a supporting program of research, such as will provide for the welfare of the land at all times, and give farmers all the advantages that progressive science can contribute. Also, a continuing, vigorous program of soil-conservation education should be made a part of our teaching from kindergarten on through college. And, modern soil conservation calls for the maintenance of all effective work which is put on the land in order to keep the land permanently productive. Such measures are not intended to be used for just a single year or cropping season.

ONLY ONE CORRECT CONSERVATION FORMULA

There is only one correct formula for doing the soil and water conservation job—regardless of what anybody may try to tell you. That formula consists of treating the different kinds of land on a farm according to their individual needs as determined by condition, and using each kind according to its capability for continued safe and economical production—whether that be for field crops, pasture, timber, or wildlife. This is a fixed physical fact of the order of the fact that water will not run uphill on its own power.

If there is any activity of mankind that requires the most scrupulous use of all that land science and hydraulics can provide, it is the work of keeping our land permanently productive and making the best use of our water supply. There are in the neighborhood of a hundred soil- and water-conservation measures now being used in the program of the Soil Conservation Service to halt erosion, conserve rainfall, and improve the land I have just mentioned a few of them. Each measure is used, as the situation demands, to meet a definite land need or to produce a specifically desired result. Usually, combinations of several measures are essential.

A hundred years of farming experience in this country has proved definitely that no single practice, applied arbitrarily on a whole field or farm, will control erosion and maintain soil productivity permanently, except perhaps the planting of an entire area to grass or trees. And we cannot live by grass and trees alone. Except where the land is covered with grass or forest, single-practice soil conservation cannot be successful, in the great majority of cases, because it almost al-

ways is inadequate to cope with the diverse and complicated requirements for sound land use and protection, imposed by nature. Some single practices, such as contouring, stubble-mulching, rotation, or manuring, may bring some temporary benefits to entire fields or farms; but they cannot get the job done on anything approximating a permanent basis, except on the relatively small areas of the very best quality land (land of capability class 1).

TREAT EVERY ACRE AND EACH WATERSHED

So I want to emphasize as strongly as I can, that there is no substitute for quality and completeness in the protection, development, improvement, and proper use of our land and water resources—in Illinois or anywhere else. Each acre of land must be used according to its individual capabilities and be treated according to its needs; because each acre of land, like each human being, is different from any other acre. Likewise, each watershed, whether large or small, must be used and treated according to its specific physical peculiarities, if we are properly to conserve, develop, and use the water and land resources of that particular watershed—any watershed.

If there were some simple remedy for our land and water problems that could be applied everywhere, according to a standardized treatment or formula, the job would be relatively easy. But there is no cure-all, no short-cut to the solution of these problems. Nothing less will suffice than a painstaking study of each acre, each field, and each watershed, and the appropriate application of all needed conservation measures that the study indicates as necessary to get the job done right. To ignore these facts is to invite further damage to our diminishing supply of productive land, as well as to waste time, opportunity, and money for the landholder, the whole community, the entire Nation—everybody.

Soil Conservation Is Good Business

EXTENSION OF REMARKS

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following address by H. H. Bennett, Chief, United States Soil Conservation Service, before the Kiwanis Club luncheon, Aurora, Ill., June 13, 1950:

Some will say, "It must be profitable." Well, sure, it is profitable practically without exception under normal conditions and if done in time. And looking out ahead, we cannot hold on to our sloping land—the great majority of ours is sloping—unless we protect it. And looking beyond that, land means food, and food means life and national strength.

THE GOVERNMENT'S OBLIGATION IN SOIL CONSERVATION

There seems to be pretty general agreement now as to the Government's obligation to help farmers with their erosion and land-use problems. Actually isn't that one of the fundamental things government was set up to do—to help the people take care of the country's resources, both physical resources and human resources? A few people, however, still try to make the point that the Government should not concern itself with helping a farmer to protect and improve his farm land, any more than it should pay part of the

cost of operating a privately owned and normally run manufacturing plant. The exceedingly important difference such objectors fail to see is that the Government's interest—local, State, or Federal—in the continuing productivity of the land is never ending.

The nation dies if its land is ruined for further production. In other words, land is the individual's property for the moment, but it is the Nation's most priceless and indispensable resource for all time. So there is the doubly compelling need of protecting the interests both of the individual and the Nation.

HOW FARMERS ARE CARRYING SOIL CONSERVATION FORWARD

The efficient and successful manner in which we in this country are moving ahead with this vital soil- and water-conservation work will prove to be, I am convinced, one of the brightest chapters in the Nation's entire history. Hundreds of thousands of farmers are practicing modern soil-conservation farming, through their soil-conservation districts which they organize under State enabling law. These districts are local units of State government for conservation, and are managed by local farmers, locally elected from among themselves for their nonpaying jobs.

Between 10,000 and 12,000 of these district governing officials, called directors here in Illinois, give unselfishly of their time and energies in the furtherance of soil-conservation work throughout the country. They are on nobody's payroll, and are obligated to no group, to no Federal or other outside authority. The Federal Government supplies technical assistance to the districts through the Soil Conservation Service, but only at the request of the districts to meet the demands of district farmers for such technical help. The districts also draw on other local, State, or Federal sources for assistance, governmental or private, as previously indicated, such as ACP payments, educational facilities of the Extension Service, information from the agricultural experiment stations and State agricultural colleges—with which our Service cooperates in its research work—advice and assistance from State departments of conservation, and so on.

COMMUNITY SUPPORT AND NEIGHBORHOOD GROUP ACTION

In short, the soil conservation districts seek the support and facilities of everybody who can contribute something to district progress—and thereby to public betterment—including business establishments, civic organizations, schools and churches, banks, railroads, and a long list of others.

Also, groups of farmers, living in more or less compact neighborhoods within districts, are contributing in a most encouraging manner toward speeding up conservation work by planning together and working together, lending one another machinery and seed, and cooperating in other work. These groups, normally bound together by ties of neighborliness and common interests such as you Kiwanians can well understand, usually range from 4 or 5 to 15 or 20 families, sometimes more. The Soil Conservation Service now is working with thousands of these natural groups.

SOIL CONSERVATION DISTRICTS

Actually, of course, the soil conservation district as such is essentially a group-action device—a genuine grass-roots organization, operated in the fullest accord with democratic principles. It is this kind of voluntary cooperation, initiated and carried on by the landowners themselves without any outside interference of any kind, that is getting the soil conservation job done.

As of May 1, this year (the latest date for which figures were available from the districts), 2,236 soil conservation districts already had been formed by landholders in the

48 States, the territories of Alaska and Hawaii, and the insular possessions of Puerto Rico and the Virgin Islands. These districts include more than three-fourths of the country's farms and a total of more than 1,225,000,000 acres.

Illinois' 94 districts covered 87 percent of the State by that date, or nearly 31,150,000 acres, and included 93 percent of your farms and 92 percent of your farmland. You will find these democratic local units of State government operating today in 97 of this State's 102 counties. Illinois thus is among the leading States in the soil conservation districts column. I hope it may not be too long before you join the 9 States, Puerto Rico, and the Virgin Islands which are 100 percent within districts, and the many other States which are nearly covered.

SOME SOIL-CONSERVATION ACCOMPLISHMENTS

District organization, of course, is not an end within itself; for any district that existed only on paper wouldn't be worth the paper it is written on. Neither is a farm plan for soil conservation, where its provisions are not applied to the land. I am happy to say there are few, if any, districts like that and a very few such farm plans. I am sure there are none in Illinois.

Up to January 1, 1950, approximately 800,000 complete soil-conservation plans had been prepared in districts alone—by farmers and Soil Conservation Service technicians out on the land together. These plans, fashioned to meet the farmers' economic situation and their ability to put them into effect honestly, covered some 220,000,000 acres. Of this quarter of a billion acres thus planned—farm by farm and acre by acre—112,000,000 acres had been treated with needed conservation measures by that time, in soil-conservation districts. These figures do not include other millions of acres surveyed, planned, and treated through other programs in which the Soil Conservation Service has assisted.

COMPLETE NATIONAL LAND INVENTORY NEEDED

Up to the first of this year, also, detailed soil-conservation surveys adequate for farm planning had been made on 322,000,000 acres, and reconnaissance surveys helpful in farm planning on another 180,000,000 acres. These land-capability surveys constitute a scientific land inventory, made by our Service's conservation surveyors in cooperation with district farmers, and cover entire farms. It shows the kind of soil, the slope, degree of erosion, and other factors which, with climate, govern the whole safe use and producing capacity of land.

This scientific inventory of the land, which should be completed Nation-wide at the earliest practicable date, not only is the foundation on which rests effective conservation planning and treatment, but can be beneficially used for other planning purposes. We could use it for evaluation of land for loans, which would be sounder and more equitable if made on the basis of the land's capability for production. Land capability also could be used as the basis for beneficial adjustments in all types of agricultural credit, land tenure, and shifts in crop acreage, and it might well be used as a guide for the wise expansion of rural road building, rural electrification, and the orderly development of other community enterprises, especially those planned for permanency.

The record of soil conservation district accomplishments here in Illinois likewise is good, but you can obtain specific State and local figures on conservation surveying, planning, and treatment without my bringing them all the way out here from Washington to you. The important thing is that we have made progress—remarkable progress—in the comparatively short while we have been seriously at the soil and water conservation job. I truly believe—and many agree with me—that this Nation has made more actual progress in solving its land con-

servation problems during the last few years than any nation or people ever made in such a short time. It was only 20 years ago that we took our first positive step toward a national program of soil conservation, through congressional authorization for establishing a number of erosion control experiment stations; and the first soil conservation district didn't come into being until 1937.

HOW WE ARE SPEEDING UP CONSERVATION WORK

Also, our soil conservation work is speeding up, within the limits of available technical and other facilities. The records for 1949, to illustrate, show that the Soil Conservation Service helped farmers of the country to complete 18 percent more conservation work on the land than in the preceding year. In the fiscal year 1942, the Service helped farmers in districts complete the conservation job on 5,000,000 acres. In the fiscal year 1949, the job was carried out on 22,000,000 acres. Twenty-two million acres of land efficiently treated—treated scientifically and practically to the very best of man's accumulated knowledge and ability, and this on the basis of permanent work.

The public has not fully understood this well enough. It is time some of these facts were known. They are the best answer to such criticisms as we sometimes hear that the way the Soil Conservation Service goes at the job is all right, but too slow, or that soil conservation costs too much. I am the first to agree—and have been so proclaiming for 15 years—that we need to push ahead continually faster with the conservation job, if we are to get the basic work done in the next 20 to 25 years. And, obviously, it should be done in that time. We are still losing some 500,000 acres of productive land each year in the United States through continuing erosion. But neither I nor anybody else who really knows anything about soil and water conservation will seriously propose that we sacrifice the lasting quality of this vitally needed conservation work for the sake of slapping some half-way measures on the land in a few years less time. Such measures may be temporarily helpful, but they are not of the permanent type.

FARMERS' DEMANDS OUTRUN CONSERVATION FACILITIES

The continuing need, as it will be for some years yet, is for more technical and other manpower, machinery, materials, etc., directed to the conservation job, in order to pick up the lag and keep pace with farmers' demands which consistently outrun the availability of such facilities. This is quite different from the situation in the early demonstration project days, when we sometimes actually had to go out and try to convince the farmer on the idea that soil conservation is a good thing for his land and for his farming business.

Right here in Illinois, for example, there was a backlog of 9,158 applications for such district assistance last January 1. With an average of 3¼ permanent service employees per work unit in the State, a waiting workload like that obviously cannot be overtaken in a week or a month, although the district directors and service personnel are equally determined to get to every waiting farmer at the earliest possible date.

It is to this end that our Soil Conservation Service operations have been very largely decentralized out of Washington, thus bringing them as close to the problem out on the land as we have been able to move them. Thus, in 1949, only 14 percent of our personnel worked in the Washington office, with 87.6 percent out in the work units and other field offices—out with the farmers close to the job. And the remaining 11 percent of our people in State and regional offices included, of course, a substantial number of technical, cartographic, and other personnel directly engaged in or concerned with field

activity along lines of quality work, maintenance, and improvement.

SOIL CONSERVATION IS ECONOMIC AND PROFITABLE

As to the cost of the kind of soil conservation I have been talking about: Experiences of hundreds of thousands of farmers, under the most widely varying conditions over the country, confirm the fact that soil conservation is a profitable investment. It increases income for the farmer and for those who handle what he produces, improves business in general, and safeguards health and general community welfare. It pays back more than it costs to the farmer, to business and professional people in town where he trades, to transportation interests, and to local, State, and Federal governments which derive their revenue from taxes on production and earnings. I wish I had time to cite you some of the individual examples of this, which are legion, in Illinois and elsewhere.

How acre-by-acre soil and water conservation pays was shown, for example, in a sample inventory the Soil Conservation Service took to show 1945 income from conservation-treated farms as compared to that from similar farms on which much less conservation work had been done. In one of the two sampled areas here in Illinois, in Jefferson County, 26 conservation-treated farms had \$7.83 an acre more income, according to the farmers' books, in that 1 year alone than did 26 comparable farms where comparatively little or no conservation work had been done. In Madison and St. Clair Counties, 24 conservation-treated farms showed \$9.48 more income per acre than did an equal number of comparable farms with much less conservation work on them.

For the North Central States of Illinois, Iowa, Ohio, and Wisconsin together, the 1-year's per acre income increase from conservation on 257 typical farms over that from 255 comparable farms was \$6.37, and the national figure was \$4.90 an acre—including western range land, irrigated lands, etc. Meanwhile, we have kept close check on the cost to the Federal Government for giving the technical and certain other assistance which makes such increased returns possible. In the 1949 fiscal year, this was only \$1.80 an acre. That includes everything—technical assistance to farmers, administrative expenses, research, paper and typewriter ribbon, everything. In some parts of the country, naturally, the per-acre cost is higher than it is in others; but even if it were \$5 an acre, I think you'll agree that is a mighty small cost for expert help in safeguarding the permanent productiveness of land worth \$125 an acre or whatever the value may be.

WHY FARMERS STICK TO THEIR CONSERVATION PLANS

You can see, from this, why it is that so many farmers want to get their district conservation plans. Also, why a farmer very seldom discards his conservation plan once he has started it, except in cases of changes in farm ownership, death, etc. It's his own plan, and it makes him money. It is just good business for him to follow it.

SOIL CONSERVATION RETURNS TO KANE COUNTY AND TO NATION

And, as I said earlier, soil conservation is good, dollars-and-cents business for all of us. It has been estimated by our Washington office that in 1948, for instance, the Federal Government retrieved the entire amount spent by the Soil Conservation Service and, in addition, made a 77-percent profit in increased income taxes paid on increased returns as a result of farmers' applying effective soil conservation measures to their lands. That included the extra income tax (conservatively estimated) paid by retailers, processors, and distributors, who profited by the conservation farmers' extra production and spending.

Some of you probably are familiar with economic studies made by E. L. Sauer, University of Illinois economist, which showed that soil conservation district type plans increase farm income. I was interested in reading in the special soil conservation issue of The Kane County Farmer of March 22, 1950, where Chairman Wendell Rolston of the Kane County Soil Conservation District had translated that increased income into terms of local benefit here in your own county. At an average of slightly more than \$5 an acre, his special project report on the district's sixth anniversary pointed out, the local district program already had added \$167,845 annually to Kane County's agricultural income. He added, significantly, that is far beyond the total cost of the entire program.

A PROGRAM OF POSITIVE ACTION

So you see this matter of soil conservation being good business is something that comes right home to your own inventories and pocketbooks. To complete the soil and water conservation job in time calls for a program of positive action, in which groups such as yours have a natural interest. It includes, among other points, (1) Completion of the national land capability inventory at the earliest date facilities will permit, (2) completion of the organization of the Nation's agricultural lands into soil conservation districts, and strengthening district responsibility and work—with a scientifically developed soil conservation district plan applied by a conservation farmer to every farm in the country at maximum public cost, (3) active participation by all interested rural and urban groups—business, professional, and patriotic—in achieving Nation-wide conservation, and (4) making a real conservationist of every farmer in the country.

To get this big job done in time is going to take the continued teamwork of all of us. The margin between land deterioration and conservation now has been narrowed to the point where our goal of a permanent agriculture is in sight. Through unflagging research, education, and group action in getting conservation on the land, we can and will do this job we have set out to do.

Operation Comeback: American Legion National Essay Contest

EXTENSION OF REMARKS OF

HON. ALEXANDER WILEY

OF WISCONSIN

IN THE SENATE OF THE UNITED STATES

Wednesday, September 26, 1951

Mr. WILEY. Mr. President, I send to the desk a statement which I have prepared along with certain attached materials regarding the splendid essay contest entitled "Operation Comeback," sponsored by the American Legion. The contest was designed to show how physically handicapped can overcome their disabilities. I ask unanimous consent that this statement and the appended essays be printed in the Appendix of the Record.

There being no objection, the statement and essays were ordered to be printed in the Record, as follows:

NATION-WIDE ESSAY CONTEST PROVES VICTORY OF THE HANDICAPPED

Mr. WILEY. Mr. President, on several previous occasions, I have commented regarding the important matter of rehabilitation of America's physically handicapped. At this time, I want to pay tribute to one particular

organization which has done a superb job down through the years in rehabilitation work. I refer to the American Legion whose latest example of service of America's veterans and America as a whole, is in the form of its Nation-wide essay contest entitled "Operation Comeback."

This contest was opened to all handicapped, honorably discharged veterans of World Wars I and II and the Korean campaign. By means of the contest, the Legion has focused the attention of the American people on the courageous come-back made by our handicapped citizens, particularly the heroic men and women who saw service in their country's uniform.

If one were to attempt to write a fiction story, one could not convey the powerful human interest and drama which these essays in Operation Come-back have told. One could not duplicate the drama of these brave souls fighting courageously to come back—to occupy their rightful place in the human family in spite of their handicap.

The contest offers food for every American's serious thinking. Reading the essays should make every American humble. Certainly very few, if any, of us have any trouble in the world which can possibly compare with the great suffering which these men and women have gone through, but which they have bravely overcome.

ESSAYS ARE ENCOURAGING

The essays provide a wonderful source of spiritual encouragement. Why? Because they tell how firm is the reliance of these handicapped veterans in divine providence. The essays are inspiring too in that they attest to the loyalty of members of their families, particularly wives and children who have stood by the servicemen throughout their darkest days of rehabilitation.

I'd like to quote briefly from an introduction to a collection that was made of all of the various heart-warming materials that were published in connection with the contest. This collection was made by the National Public Relations division of the American Legion. I might mention, incidentally, that the director of that division is our own able former Senate Sergeant-at-Arms, the Honorable Edward F. McGinnis. The assistant director is Mr. J. Norman Lodge, formerly of the Associated Press.

This is the introduction to the compendium:

"OPERATION COME-BACK

"This is Operation Come-back, a contest of letters for handicapped honorably discharged veterans of World Wars I and II and the Korean campaign. Through the generosity of an anonymous donor in New York City, \$10,000 was made available for the prize moneys and administrative expense. More than 100,000 pamphlets were printed and sent to all departments. The response was 586 attested letters embracing all the ailments and injuries that can befall mankind.

"A responsible board of judges was secured. Preliminary seeding of letters was done by representatives of the American Legion's rehabilitation staff, the VES and other bodies interested in the handicapped. The final judging, for 20 announced prizes was from 100 of the better letters. This closeness of the contest is attested by the fact that the veteran who led the winners had a percentage of 89.3 while the two tied for twentieth place were rated at 84.1.

"Judging was on a basis of extent of handicap, 40 percent; spiritual come-back, 20 percent; economic come-back, 30 percent; and presentation and neatness, 10 percent, the latter to give the uneducated as fair a chance as the college man.

"Every letter received was a sermon in itself. Fortitude, American spirit, personal suffering, and morale recovery was manifest in every letter. Handicaps were not limited to war wounds. The letters were coded so that the home State of the entrant was not

known to the final judges. Every possible means was utilized so that fairness would be paramount. Now the winners are known."

I wish that it were possible to name all of the folks inside and outside the Legion who contributed to Operation Come-back—men like T. O. Kraabel, head of the Legion's National Rehabilitation Division and his staff. They performed a grand job. I know that every handicapped person in the United States, man, woman, and child, veteran and nonveteran, will be the better for this contest having been conducted. Remember, the contest is based on concrete deeds and accomplishments of the individual involved.

WISCONSIN PRIZE WINNER

I am naturally particularly delighted that one of the four principal winners is Mr. Douglas Davenport, of New Lisbon, Wis., who has performed an amazing recovery from the shrapnel and sniper wounds which he suffered in France in 1944. Mr. Davenport, aged 43, is chairman of the county draft board, county civil defense director, operates a dairy bar and recreation center, and makes a splendid contribution to the community in many other respects. I know that the American Legion Department of Wisconsin must be very proud indeed of men like him and his disabled buddies. Mr. Davenport, incidentally, served as adjutant of his Legion post and as county Legion commander.

I know, too, that every one of the 4,000,000 Legionnaires and members of the Legion Auxiliary are proud of the work which their organization has performed in rehabilitation, as in so many other fields.

Fortunately, the Legion's activity is a part of a great drive conducted by many civic sources to be of genuine service to the handicapped. Recently, a powerful motion picture on the problems of blinded veterans' rehabilitation was produced by Universal-International Pictures. It was based on the book Lights Out, by Baynard Kendrick. It is based on Mr. Kendrick's years of devoted work with the blind, particularly with servicemen who had lost their sight.

NEPH WEEK

Another of the important means of aiding the handicapped is National Employ the Physically Handicapped Week which will be celebrated this year beginning on Sunday, October 7 and extending through the following Saturday.

This week is not just another commemorative event. It has proven the rallying point for the great task of assuring vocational justice for the disabled. In thousands of communities throughout the land, NEPH Week has permitted the focusing of public attention on the need for giving the handicapped a fair break by permitting them to use their remaining skills in appropriate jobs, skills which they have in countless instances proven to be exceptional in character.

We know that placing the disabled in jobs is not just a matter of fair play to these men and women; it is a matter of plain horse-sense insofar as the employer is concerned. Why? Because the handicapped worker proves himself to be a better worker, with higher morale, more diligence, a man or woman who uses his remaining skills to an exceptional degree.

America's handicapped don't want pity, they don't want maudlin sympathy, they don't want anything artificial in their behalf. They do want to be given a fair break. Insofar as our veterans are concerned, a grateful Nation has provided them with certain statutory rights and benefits, as a part of their legal entitlement for having saved this country on the field of battle. Often their statutory awards and pensions have fallen far behind the rising cost of living. Certainly, the Congress by its act of keeping pensions adequate in purchasing power, can

help fulfill its responsibility for the handicapped.

There follows now the American Legion release on the contest and the four prize-winning essays. Each of the essays is simple, clear-cut, very frank in its contents. There is nothing phony about what these men and women have written, because it is straight from their hearts, straight from their daily lives and it will go straight to every American's heart. The essays are "strong meat." Let them remind us all of the bitter price of war, but the "bright victory" over the darkness.

[Press release of the American Legion,
September 23, 1951]

WASHINGTON, D. C., September 23—Two blinded veterans, a multitortured prisoner of the Japs and the victim of a direct hit of an artillery shell which caused paralysis, today were named winners of \$1,000 each and a fully paid trip to the national convention of the American Legion at Miami, October 15-18 as a result of their entries in Operation Come-back, a contest of letters for handicapped veterans.

The winners are: Thomas C. Hasbrook, a blinded veteran of 6001 Haverford Street, Indianapolis, Ind.; Charles A. Boswell, also blinded, of 111 Hermosa Drive, Birmingham, Ala.; Lewis Astor Moore, a victim of Japanese atrocities, of 107 Hillside Circle, Gadsden, Ala., and Douglas B. Davenport, a paralytic as a result of a direct shell hit, who lives in New Lisbon, Wis.

There were 16 other winners in this Nation-wide contest, four receiving \$400 each; four being enriched by \$200 each; four by \$100 each; and four by \$50 each.

The contest, which closed September 1 with 586 entries, produced a sermon of personal suffering, morale building and fortitude with each letter. There were double and triple amputees, paraplegia, polio, tuberculosis, and the entire gamut of other ills that befall mankind.

The four first-place winners will be presented their checks at the Miami convention. The others will be mailed to the winning contestants.

Final judges for the contest, which opened in June, were: Dr. Ross T. McIntyre, former Presidential physician and presently the head of the President's Committee for the Employment of the Physically Handicapped; Dr. Verne K. Harvey, Medical Director of the United States Civil Service Commission; Perry Faulkner, Chief of the Veterans' Employment Service of the Department of Labor; and T. O. Kraebel, director of rehabilitation of the American Legion, all of Washington, and Capt. Eddie Rickenbacker, William Randolph Hearst, publisher, and Dr. Edward Sheekman, all of New York City.

Handicaps were not limited to war injuries. In fact, one of the first-place winners, Mr. Hasbrook, suffered his handicap in Camp Lejeune when a land mine exploded while he was training on a combat course.

Among the winners was one former member of the WAVES who suffered multiple sclerosis but gamely made her come-back physically, economically, and spiritually. Presently she is working in the Crime Prevention Bureau at Chicago. She is Mrs. Ellen Hayes Ahearn of 61 East Goethe Street, Chicago.

All judges agreed that judging the letters was the toughest assignment they had ever encountered.

The contest money was provided by an anonymous donor in New York City.

Eventually a large number of the letters will be reproduced in booklet form and distributed to hospitals in the hope that other handicapped persons will benefit by the come-back of these veterans who had a rebirth after life seemingly had passed them by.

OPERATION COME-BACK

One thousand dollars each, plus a fully paid trip to the American Legion national convention at Miami, Fla.: Thomas C. Hasbrook, 6001 Haverford Street, Indianapolis, Ind.; Lewis Astor Moore, 107 Hillside Circle, Gadsden, Ala.; Charles A. Boswell, 111 Hermosa Drive, Birmingham, Ala.; Douglas B. Davenport, New Lisbon, Wis.

Four hundred dollars each: Peter J. McKenna, Jr., 2911 Seventh Street NE., Washington, D. C.; Ralph J. Anslow, 6823 Marcell Avenue, Glendora, Calif.; Douglas R. Stringfellow, 566 Twenty-fourth Street, Ogden, Utah; Ralph L. Andres, Rural Route, Fairbury, Nebr.

Two hundred dollars each: Joseph Press, 156 Goffe Terrace, New Haven, Conn.; Jephtha C. Tankley, 93 Princeton Way NE., Atlanta, Ga.; Edward J. Hoyceyk, 601B Allenhurst Road, Buffalo, N. Y.; Irvin P. Schloss, 2901 Eighteenth Street NW, Washington, D. C.

One hundred dollars each: William Kleinmanns, 581 Highland Avenue, Ridgewood, N. J.; Robert J. Sterling, 17 Flint Street, Manchester, N. H.; John R. Collins, Ashland, Ill.; Robert C. Harris, VA Hospital, Topeka, Kans.

Fifty dollars each: Clayton L. McCleskey, 702 Magnolia Drive, Waycross, Ga.; Charles J. Delong, 126 Brantwood Drive, Montgomery, Ala.; Otho E. Hawes, 2953 Portland Street, Eugene, Ore.; Robert D. Melcher, 3450 Carmous Avenue, Los Angeles, Calif.; Mrs. Ellen Ahearn, 61 East Goethe Street, Chicago, Ill.

HOW I OVERCAME MY PHYSICAL HANDICAP

The story of my "come-back" is not a story of great financial success but one of great joy for being alive and able to serve my comrades and community to the fullest extent.

While on duty as a private with Company E, One Hundred and Ninth Infantry, Twenty-eighth Division, I was wounded on August 25, 1944, while attacking the town of Elbuef, on the Seine River in France.

The Germans hit a tank point blank with an "88" which was a few yards to my rear. I then lost my "rear side." One ragged piece of shrapnel entered my spine at the lumbar-sacral joint and caused me to be paralyzed from the waist down, a second piece tore a large hole in the sacral region which took over 2 years to heal. A third large piece tore off (and damaged other organs), which I have not used since. A fourth piece went through my left leg below the knee, fracturing the tibia and leaving me with a drop foot. A fifth fragment tore away a large part of the right thigh. A German sniper took several shots at me while I lay waiting 6 hours for aid, one of which hit me in the left elbow.

During 2½ years of hospitalization, in eight Army hospitals the piece of shrapnel was removed from my spine and the motor controls partially returned, leaving a sensory paralysis. I was finally discharged with a permanent colostomy and lack of control of my bladder. The VA recognizes 290 percent in disabilities and I am on an "out-patient" status.

In less than 90 days the county service officer who was commander of the American Legion post, and the district attorney, who was county commander of the Legion, secured my appointment filling a vacancy as clerk of circuit court. I have been re-elected twice.

Prior to entry in service I was a traveling salesman for a soap company. Knowing that I could not travel with rubber sheets, urinal, and a supply of dressings, I returned to my wife's home town of 1,400 people, thinking I would be an invalid.

I now have a feeling of usefulness in the community and have tried to repay everyone by giving extra service in any way I can. In

the 4 years since my discharge I have had the pleasure of serving the county as clerk of circuit court (4 years), chairman of the draft board (3 years), chairman of civil-defense program, the city as alderman (2 years), acting city clerk upon death of clerk; my Legion post as adjutant (1 year), county service officer (2 years), county commander (last year), correspondent Forty and Eight.

I have kept myself so busy that I do not have time to think about my pains or myself and am enjoying being useful.

Respectfully submitted.

DOUGLAS B. DAVENPORT,

New Lisbon, Wis

HOW I OVERCAME MY PHYSICAL HANDICAP

The pronouncement of a Navy doctor—"You'll never see again"—was like a death sentence. The land mine which had exploded in my face on the combat-conditioning course at Camp Lejeune seemed unimportant. At 23 I would never again see the faces of my loved ones—my home town—even sunshine.

I remember sitting on the ledge of a twelfth-floor hospital window thinking that the easy way out would be to lean over—but I knew that the coward's way was not right with God and not fair to my wife and family. The strength which upheld my wife, which helped her to face her plight without self-pity, made me realize that I needed the peace of mind which she found in her religion. From her example, I learned that spiritual guidance helps one over life's rough spots.

Before leaving the hospital, I learned to type, studied Braille, and played bridge with my doctor. My month's association with able, alert blind people at the seeing eye school convinced me that I, too, could enjoy life, and there I found a pal and a means of safe conduct in my seeing-eye dog, "Ray."

When my former employer offered me a job, I jumped at the chance. I worked as a clerk-typist, not as the laboratory technician I had been before entering the Marines. I had to show my fellow employees that, with the exception of my eyes, I was just as normal as before. I worked successfully as clerk, secretary, disc jockey, and public-address-system announcer, journalist, and public speaker. My present responsibility as public-relations representative for one of the world's leading pharmaceutical firms is many times greater than that which was mine before entering service. My wages are trebled.

Ample incentives for working hard were arranged for me at home. Within a year after my accident my daughter arrived. She and her three younger brothers create a happy, noisy household. These youngsters played an important role in my come-back. They keep me from becoming lazy, take my mind off myself, keep me up to date.

Blindness endowed me with more understanding, sympathy, and interest in my fellow man than I had before. I found myself wanting to do something for others because so many help me. The Veterans' Administration drafted me to visit disabled veterans in my State. This led to work with the Blinded Veterans Association—eventually, to its national presidency. I made speeches on aiding disabled veterans, Americanism, and the meaning of blindness. I became interested in government and ran successfully for a seat in my State assembly. Exactly 5 years after I lost my sight I was named by the United States Junior Chamber of Commerce as one of the Nation's 10 outstanding young men.

If I have overcome my handicap, I am humble, for I know that I was only able to do so because of a rich heritage of things which are America.

Respectfully submitted.

THOMAS C. HASBROOK,
Indianapolis, Ind.

HOW I OVERCAME MY PHYSICAL HANDICAP

I entered the United States Army in 1939 at the age of 16 while still a high school student. When World War II broke out I was stationed in the Philippines. I fought in the Battles of Corregidor and Bataan. I was taken prisoner at the fall of Bataan in April, 1942. The next 10 days were spent on the Bataan death march. Six of these were without food.

The following 2½ years were spent in a series of Japanese prison camps. Here the food consisted of rice and sweet potato vines. I was forced to work exceedingly hard building bridges, planting rice and burying the dead. The lack of food was surpassed only by the lack of medicine and sanitation. My bed was mother earth and my bathroom was a slit trench which I helped dig. After 6 months the terrible prison conditions took their toll on my health. First came the dreaded malnutritional disease, dry beriberi, in my feet and legs. The terrific shock of this killed most of the nerves in my eyes causing an extremely limited vision. In September, 1944, I escaped during a massacre of American prisoners and made my way to a hospital in New Guinea.

Upon returning to the United States I was sent to Valley Forge General Hospital where tests showed my vision to be 20/200. From here I was sent to the Rehabilitation Center for War Blinded Soldiers at Avon, Conn. I was given extensive training in insurance here before being discharged in March, 1946. I started to work in the general insurance business and a grateful Government gave me every assistance. It furnished me with reader service for 2 years, a sound scribe, magnifying glasses and any aid which I could use to overcome my handicap. The Veterans' Administration gave me 2 years on-the-job training and 1 year self-proprietor training.

I could not possibly have attained the success which I have had had it not been for the assistance of the Veterans' Administration and my wife whom I met while in service and who is also a disabled veteran. After 5 years my vision has dropped to twenty-four hundredths, however, I have advanced as far in 5 years as most insurance men do in 20. I have built a medium-sized general insurance agency which represents 15 large fire and casualty companies and which gives me an annual net income of ten to twelve thousand dollars.

I am vice president of a group insurance company, a director of a life-insurance company, a director of the Alabama Association of Insurance Agents, and I helped organize and am a director in a fire-insurance company. I also hold membership in the following social organizations: Blinded Veterans Association, the Moose lodge, church (which I attend every Sunday), the Veterans of Foreign Wars, and the American Legion Post, 213, which another veteran and I organized and in which I have served as an officer three times.

LEWIS ASTOR MOORE.

GADSDEN, ALA.

HOW I OVERCAME MY PHYSICAL HANDICAP

Shortly before the Battle of the Bulge, the tank in which I was carrying supplies to my company, was struck by a shell. As I climbed out, another shell exploded, filling my chest and face with fragments, and blinding me. On reaching the States 4 months later, I learned I would never see again.

Thus ended all my dreams for the future, for I had entered the Army so soon after college that I had been unable to begin a career. I had played football and baseball at college, and had planned a career in professional baseball. Now I had no means with which to provide for my wife, small daughter, and the baby we were expecting.

The next few weeks were the darkest of my life. I had always been so active, independent and self-reliant. How could I adjust

myself to a world of inactivity, pity, and despondency? Just as my spirits reached their lowest ebb, I began the rehabilitation program at Valley Forge Hospital. Trained men taught me to type, to read and write Braille, to walk through traffic unaided, and helped me regain my self-confidence and self-reliance.

At this time, I was introduced to golf, a game that was to play an important part in my rehabilitation. Golf was one sport I had never tried, and I had no illusions about the ability of a blind man to play it. But from my first swing of a driver, I realized I had found the answer for my love of competitive sports.

After Valley Forge, at Avon, Conn., I underwent a more intensive program. Because of my love for, and knowledge of sports, I decided to enter the sporting-goods field, and took training courses in that line.

Getting home at last to my family, I began the arduous task of convincing the world that a blind man can hold a job. Finally I was given a chance to sell sporting goods for a department store. There my knowledge of athletics and the training I had received, earned me a promotion to manager of the expanding department. Now, I handle all invoices, correspondence, go to market to buy merchandise, keep a close check on inventory, wait on customers, and know the prices of all items in stock.

After 7 years of blindness, I feel that my rehabilitation is complete. Neither my wife nor I have let my blindness keep us from living a normal life. We dance, attend movies, play cards and golf together. I have won 5 national and 1 international golf tournaments in the past 5 years, and my golf has taken me from Maine and Canada to California. I am also active in Lions Club, Sight Conservation, church, and Cub Scout work, and frequently make speeches at schools and clubs. In 1949 I was selected Hero of the Year by the National Disabled Veterans Association.

I have found that blindness is not a handicap, it's just an inconvenience.

Respectfully submitted by,

CHARLES A. BOSWELL.

BIRMINGHAM, ALA.

The Banker and Soil Conservation**EXTENSION OF REMARKS**

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following address by H. H. Bennett, Chief, United States Soil Conservation Service, at the eleventh annual Pacific Northwest conference on banking, Washington State College, Pullman, Wash., April 8, 1950:

THE BANKER AND SOIL CONSERVATION

Your decision to make soil conservation the subject of today's program of your Pacific Northwest Conference on Banking seems to me to be doubly significant: In the first place, I can think of no group, short of land-owners and operators themselves, which has a more direct, concrete interest in the permanent security of our productive land. And I can think of no part of the entire country which has a richer heritage of good land than this Pacific coast area.

You, the bankers of Washington, Oregon, Idaho, Montana, California—or any other State for that matter—will always be concerned with both the value and stability of

the land. In the long run, I am certain that each of you will be interested in every parcel of farmland in your territory, and in the country as a whole for that matter. Regardless of the current price of farm commodities, irrespective of the various factors that may temporarily send land values up or down, there is always the common denominator of the real, productive worth of each acre of land—its base value. You who are serving agricultural or timber-producing communities—and what bank out here isn't—are vitally concerned with the ability of the land to go on producing wheat and peas, furit or livestock, sawlogs or pulp.

Every time you are asked to make a loan—be it a long-term mortgage or intermediate credit financing—on real property beyond the city limits, you must ask yourselves: Is it a good farm or just a poor, rundown piece of land? Will it produce? If it will, it is a sound piece of property—and dependable security—in both boom times and slack. Our productive land altogether comprises our principal capital asset. It produces all but a fractional part of our food, most of our fiber; and all of our wood, leather, and vegetable oils and fats. Earnings from the land—the continuing flow of new wealth—move constantly back and forth through your hands. So you are as a matter of course interested in a dollars-and-cents way that will insure, guarantee, or do whatever is the equivalent of assuring the continued productivity of the land.

WHAT WE CAN DO ABOUT CONSERVATION

The very circumstance of my being here today bears me out in this observation. I am not a banker; but every one of you is a potential conservationist—as practitioner, advocate, or both. All of us have a common interest in safeguarding, through proper use and protection, our capital assets of productive land and the water which makes land produce. There is much we need to be thinking about, talking about, and doing something about in this regard. I hope we will stick pretty closely in this discussion to what we can be doing toward furthering the application of real and lasting conservation to the land, whether it is here in the Palouse of Washington and Idaho, the triangle country of Montana, the Willamette Valley of Oregon, or the Sacramento Valley in California.

All of us can do more about soil conservation—bankers and other businessmen, educators, and other professional people, soil conservationists, and farmers—if we work at the job hard enough. And we are sharply reminded of this challenge to our best efforts in scientific conservation skill, financing, and downright hard work on the land by every new dust storm that is reported out of the Great Plains; every flood marching down the Columbia, the Mississippi, or other river; and every decline of an irrigation, drainage, or other producing agricultural area as the result of erosion, water-logging, or the accumulation of toxic salts.

In presenting this conservation challenge to bankers and everybody else, I am not unmindful of the widespread constructive interest and many concrete actions bankers of the Pacific Northwest—and the rest of the country—have taken toward the furthering of soil and water conservation. This extremely helpful support from the banking industry has ranged from the Nation-wide conservation activities of the American Bankers Association to the constant plugging over the year for more soil conservation here in the Palouse by Manager Charles E. Funkhouser of the Palouse branch of the Old National Bank. As many of you know, that has included talking soil conservation to his customers, putting up cash contest prizes, and otherwise promoting conservation interest in the local schools, and financing the novel conservation signs you see along the highways out here.

It was only the middle of March that Mr. A. G. Brown, Director of the ABA's Agricultural Commission, and Mr. H. P. Burdette, chairman of the Commission's soil-conservation committee, called on me to discuss the bankers' interest in soil and water conservation—and specific things bankers can do by taking conservation into account in their basic operating policy. It was heartening to me as a soil conservationist to hear their enthusiastic comments on the importance of soil conservation to agriculture as seen from the bankers' point of view. This is what Mr. Brown told me, among other things:

"I think the bankers all over the country recognize the great importance of soil conservation. In most places I have been, I find that our bankers are taking a more lively interest in this side of agriculture, and are anxious to explore ways in which they can help the program along in their relations with farmers and ranchers. Among other things, I find more and more bankers are giving additional credit, where it is needed, when a farmer comes in and shows he is taking care of his land with soil conservation farming; because that is about as good evidence as anybody can get that a man is a good risk."

Mr. Brown pointed out that the Agricultural Commission of the ABA is working on the matter of extending credit, also, for soil conservation improvement work, and that it attributes a great deal of importance to conservation from the credit standpoint. I likewise was greatly interested in learning from these gentlemen that the American Bankers Association has recognized the importance of good farm-forestry practices by setting up a special committee on forestry. As I understand it, this committee is not concerned with the big commercial timberlands, but rather with farm woodlands as a source of farm income. That is of particular interest to you people out here, and I might add that our Soil Conservation Service work through the farmer-voted and farmer-managed soil conservation districts has long put much emphasis on this very point and has done considerable work in this direction.

CONSERVATION ERA

In this new soil conservation era, as I prefer to call it, conservation of land, water, forest, grass, cultivated crops, and wildlife are, for the first time in history, being tied together and scientifically coordinated on the basis of land capability and need. I believe I can say that the national policy and public thinking, with few exceptions, are agreed on the utter necessity of conserving these interlocking natural resources. And at this point, before we take up further specific points bearing on banking and soil conservation relationships, I think it would be well to consider for a moment just what we mean when we talk about modern soil conservation. In the first place, the work of the Soil Conservation Service is based on the findings of a few specialists who, while making soil surveys in the old Bureau of Soils, came to understand that land differences must be given full and due consideration in any work that might be undertaken for sound land use and adequate protection of land from erosion, water-logging, etc. They understood, also, that under normal climatic conditions, nature not only built soil, but was able to keep land permanently productive.

Modern soil conservation consists of the kind of sound land use and protection needed to keep the land permanently productive while in use. It means terracing land that needs terracing; and contouring, strip-cropping, and stubble-mulching the land as needed, along with supporting practices of crop rotations, cover crops, green-manuring crops, etc., wherever needed. It means gully control, stabilizing water outlets, building

farm ponds, locating farm roads and fences as nearly on the contour as practicable, planting steep, erodible land to grass or trees, development of good pastures, and devoting good management to them after they have been developed.

MODERN SOIL CONSERVATION

Modern soil conservation, moreover, consists of doing these and still other necessary things. Where land is too wet, modern soil conservation calls for drainage, with full consideration given to wildlife needs, if it is too dry, it calls for irrigation; if it is subject to wind erosion, it calls for windstripping, tree planting, growing cover crops, and stubble-mulch farming. If plant nutrients, lime, and the humus supply of the soil have been depleted, it calls for fertilization and addition of lime and organic matter; if water-soluble salts have accumulated in toxic quantities, it calls for both drainage and leaching out of the salts by flooding. And modern soil conservation calls also for the use of the best of the most adaptable varieties of crops as well as the most efficient of adaptable tools available to farmers.

It likewise includes, for flood control and reservoir protection, treatment of whole watersheds with the right combinations of practices, land use and small structures in the smaller watersheds where floodwaters start. Applied at the right time and place, such watershed treatment saves soil and reduces flood and sedimentation damage, stores water in the soil for plant use and, where conditions are favorable, in the underground strata.

And, of course, an indispensable part of modern soil conservation is a supporting program of research, such as will provide for the welfare of the land at all times, and give the farmers all the advantages that progressive science can contribute. Also, a continuing, vigorous program of soil-conservation education should be made a part of our teaching from kindergarten on through college.

Moreover, modern soil conservation calls for the maintenance of all effective work which is put on the land to keep it permanently productive. Such measures are not just for a single year or cropping season. There is only one correct formula for doing the soil and water conservation job. That formula consists of treating the different kinds of land on a farm according to their individual needs as determined by condition, and using each kind according to its capability for continued safe and economical production.

This is the kind of modern soil conservation farming which hundreds of thousands of farmers and ranchers are practicing. The banks of the Nation are serving these farmers more and more as they move ahead with their conservation work, through their soil-conservation districts. They do this with technical assistance which they request from the Soil Conservation Service. They also draw on other local, State, or Federal sources for assistance, governmental or private, such as ACP payments, educational facilities of the Extension Service, information from the agricultural experiment stations and State agricultural colleges with which our service cooperates in its research work.

SOIL CONSERVATION DISTRICTS

Approximately 2,300 soil conservation districts already have been formed by landholders under State enabling laws in the 48 States, the Territories of Alaska and Hawaii, and the insular possessions of Puerto Rico and the Virgin Islands. These districts include more than three-fourths of the country's farms and a total of more than 1,210,000,000 acres.

Although your west coast country as a whole is not yet as well covered by districts as are some other sections of the United States, I hope it won't be too long now before the greater part of your farm and

pasture lands likewise will be in districts, and thus in better position to move ahead faster with needed soil-conservation work. I know it can be done, because 94 percent of Washington's farms, for example, already are in soil-conservation districts. Montana's districts (including the grazing districts with which we also cooperate) take in nearly 80 percent of its farms and 70 percent of its farmland.

In other words, if you are in an agricultural section, most of you will not have to travel far to find a soil-conservation district. If you should have to go far, let me suggest that one of the most constructive contributions you can make to the conservation cause in your territory is to familiarize yourselves with these farmer-operated local units of State government and encourage the landholders of your own localities to get busy and organize such districts themselves. And another suggestion is that you get acquainted with the districts already established.

The local district supervisors, or directors, are responsible, progressive individuals you will find satisfaction in dealing with; and I am sure you will find them more than glad not only to explain their conservation program but to take you out and show you what is going on in the fields, pastures, and farm woodlands of their districts. So will our Soil Conservation Service technicians who are providing technical help to the districts—that is, of course, within the limits of their time.

ACCOMPLISHMENTS

I won't bore you with a long string of figures, because you can obtain local accomplishment figures at any time from our local, State, or Portland regional offices. But I do want to call attention, briefly, to this record of accomplishment Nation-wide; because district organization, of course, is not an end within itself, and a district program that exists only on paper isn't worth the paper it is written on. Neither is a farm plan for soil conservation, where its provisions are not applied to the land.

Up to January 1, 1950, approximately 800,000 complete soil-conservation plans had been prepared in districts alone. These plans covered some 220,000,000 acres, of which more than 112,000,000 acres had been treated with needed conservation measures by that time, in the districts. These figures do not include other millions of acres surveyed, planned, and treated through other programs in which the Soil Conservation Service has assisted. Up to the first of this year, also, detailed soil-conservation surveys adequate for farm planning had been made on 322,000,000 acres, and reconnaissance surveys helpful in farm planning on another 180,000,000 acres.

AN INVENTORY OF THE LAND

These land-capability surveys constitute a scientific land inventory, and one which can be invaluable to bankers in agricultural areas. This inventory is made by the Service's conservation surveyors, in cooperation with district farmers and ranchers, and covers entire farms. It shows the kind of soil, the slope, degree of erosion, and other factors which, with climate, govern the whole safe use and producing capacity of land. This information, in the hands of the farmer and technician, serves as an accurate land base for the cooperative development of scientifically accurate farm plans. It shows for the entire farm—field by field and area by area—the condition of the land and its capability for production, whether for row crops, orchards or vineyard, pasture, timber, or wildlife. Thus capability classes I, II, and III are good cropland, valuable in the order named; class IV is best for grass but can be cultivated occasionally; classes V and VI are suited for pasture or timber; and class VIII is best for wildlife or parks.

The Banker and Soil Conservation

EXTENSION OF REMARKS

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following address by H. H. Bennett, Chief, United States Soil Conservation Service, at the eleventh annual Pacific Northwest conference on banking, Washington State College, Pullman, Wash., April 8, 1950:

This scientific inventory of the land, which should be completed Nation-wide at the earliest practicable date, not only is the foundation on which rests effective conservation planning and treatment, but it has numerous other benefits, current and potential. One is that it supplies the basis for optimum development and maintenance of our water, timber, wildlife, and other land-related natural resources. This information, similarly, would enable us to retire from cultivation to grass or trees, on a sound basis, those lands not suitable for tilled crops. In this way we have the opportunity to take improperly used land out of cultivation and put it to more adaptable and long-time profitable uses, as for timber production.

Of more direct interest and concern to you as bankers, evaluation of land for taxation or loans would be sounder and more equitable if made on the basis of their capability for production. Land capability could also be used as the basis for beneficial adjustments in all types of agricultural credit, land tenure, and shifts in crop acreage; and it might well be used as a guide for the wise expansion of rural road building, rural electrification, and the orderly development of other community enterprises, especially those planned for permanency.

This matter of developing expanded conservation credit facilities is most important, and it offers a real opportunity to private and public lending institutions alike to translate soil conservation into their every-day business operations—where it counts. The Soil Conservation Service makes available technical help to landowners and operators in conservation surveying, planning, assistance in establishing initial conservation measures on the land, and in their maintenance; but the landholder bears the cost of materials, labor, machinery operation, and so on. This may entail financing over and above the ordinary operating expenses of the farm, particularly where earth moving or structural work is involved, such as land clearing, irrigation, or drainage improvements, terracing, building farm ponds, etc.

Almost always, experience has proved, the conservation work repays the cost many times over, returns frequently starting the first year after the planned treatment has been applied. Clearly, conservation treatment of the land should not have to be held up for want of a little credit to tide the landowner over the initial stage of applying his conservation measures. And with any decline in national farm income, as compared to war years, credit for soil conservation might become even more important than at any time heretofore.

Suppose, for example, a farmer's district farm conservation plan calls for applying the basic measures over a period of 4 years, and he wants to finance the work as it is done, the way you finance building construction to meet materials and payroll costs as construction progresses. What the farmer

needs, then, is, say, \$500 the first year, \$1,000 the second year, and similar amounts the last 2 years; but he wants to pay it all off after all the work is done, in an agreed-upon number of years, during which his conservation measures are bringing him in increased income. Of course, he will have been keeping up the interest payments year by year in the meantime.

Government credit agencies are favorable to soil conservation financing and have been pushing it, but it takes private banking support, too, in order to swing a job as extensive and important as this is. Some progress has been made toward improvement of credit facilities for farmers who want to adopt or expand soil conservation work; but there still are many communities where adequate credit at reasonable rates of interest is unavailable for such purposes. The solid results obtained from investments in conservation farming, in terms of increased income, prove that such investments usually pay for themselves; so private banking is on sound ground in extending such conservation credit, as an investment. I feel that you are going to find it safe in granting longer-term loans to conservation farmers and to soil conservation districts for their equipment purchase and the like.

I am happy to say that some banks already have been broadening their credit operations in this conservation field, and the tendency is increasing. Permanent measures of soil protection, scientifically applied to the land, are beginning to be regarded as capital assets in a few places. In some places, I am told, about all the bank asks in making a loan to a farmer is whether he has SCS soil conservation plan on his farm. I was in Tippecanoe County, Ky., last year, where the soil conservation district farmers work together in efficient neighborhood groups, as they are doing more and more throughout the country. I visited one community where our servicemen had worked with fifty-odd farmers on drainage improvements. One field I remember had produced its first crop of corn in some 15 years—estimated at 100 bushels an acre.

These farmers had tried to go it alone at first in getting this long-needed and profitable conservation work done on their lands, but it took group action and conservation financing to get the job done. A local banker told me and a group of farmers along the roadside in the drained area that his bank in La Fayette had set aside money for soil conservation loans where the only collateral required from the borrower was a farm conservation plan the Soil Conservation Service had helped him prepare.

I know from reports I have received from our people out here that similar financing of soil- and water-conservation work has been practiced by some of your banks. In Oregon, for example, where, as everybody knows, President E. B. McNaughton, of the First National Bank of Portland, has been an active soil conservation supporter for many years, I have heard of considerable activity along this line. Not only have a good number of bankers in that State pledged themselves in support of the establishment of conservation practices that require financial assistance, I understand, but they have gone on record as agreeing that making loans for that purpose is a good and profitable business. I might mention, also, such instances reported to me as Mr. Alvin Kelley's activities as cashier of the Republic Bank at Republic, Wash., in arranging for financing of certain projects of the Curlew Soil Conservation District; and financing by the bank at Tillamook, Oreg., of equipment purchase and operations in soil conservation districts of its area.

Soil conservation districts' operations over the country, incidentally, have opened up a whole new field for the financing and op-

eration of such heavy and special machinery as draglines, land levelers, grading machines, and so on. In the fiscal year 1949, to illustrate what I mean, more than 16,000 private contractors were engaged in soil and water-conservation work in soil-conservation districts, a proportionate share of them here in the West. Of all the equipment used in the then 1,961 active districts, about 95 percent was owned and operated by contractors, with districts operating the other 5 percent on cooperating farms. Soil Conservation Service equipment on loan to districts was 2½ percent of the total being used at that time. The primary equipment operated by contractors—some 38,000 pieces of nine different types—was estimated to have a new replacement value of around \$250,000,000 to \$300,000,000 alone, not including many other kinds of small farm machines they were using.

Among other conservation financing opportunities which are of particular interest in this part of the country, sound farm woodland conservation development and management might be mentioned. These may range from financing additional land or tree planting stock to financing logging equipment or portable sawmills. It is important, of course, that payment terms be such as not to force wasteful cutting of the timber.

The total outstanding farm mortgage debt in the United States reported in preliminary estimates, as of January 1, 1950, was \$5,450,000,000. Anything which improves the security of such a sum unquestionably is good business—good banking practice. As President Chester C. Davis, of the Federal Reserve Bank of St. Louis, said in speaking before the Graduate School Seminar of the United States Department of Agriculture on January 16, 1947:

"Every dollar of new capital that goes into carrying out such a soundly conceived (conservation) farm plan will repay the investor or lender in short order through increased yields and lower production costs. The farmer or land owner or mortgage lender will have a better farm 5 or 10 or 20 years from now than he has today to operate or to secure his loan, an assurance altogether lacking in American agriculture as a whole right up to now."

"In the farms we have studied," he added, "we have yet to find a case where money could not have been advanced to meet the costs of the conservation program as they arose, and be repaid entirely by the increased income from the improvements with plenty of margin to spare. Soil improvements, given only a little time, pay their own way, and more, without dipping into the income that would have been produced on the farm without the soil-building program. I know of no other type of farm mortgage credit that is so obviously self-liquidating as a loan for soil improvement."

In spite of the excellent progress we have made in our Nation-wide program of soil conservation in the comparatively few years since it started, at least 500,000 acres are ruined for any further cultivation every year in the United States, along with a much larger area damaged. And a proportionate share of that costly waste of productive land is contributed by your own agriculturally rich western States, as I am sure you know. In 1948, here in Washington, for example, in addition to the destructive floods, serious erosion occurred in various important areas, including this fabulous wheat-producing Palouse area.

TWENTY DOLLARS WORTH OF TOPSOIL TO PRODUCE \$2.50 OF WHEAT

Our Soil Conservation Service technicians, cooperating with specialists of Washington State College here, made more than 1,200 measurements of erosion losses in Whitman County alone. It was found that on many

farms a ton of soil was lost by erosion for every bushel of wheat produced. In other words, it cost, in many instances, more than 20 bushels of rich soil to produce 1 bushel of wheat. In many parts of the country, the price of topsoil, if you buy it by the bushel and haul it, runs around \$1 a bushel. If this is the value of a bushel of topsoil, then the cost of growing \$2.50 worth of wheat (1 bushel) in 1948 was \$20.

Altogether, it was estimated that, in 1948, 160,000,000 tons of soil were washed out of fields within the drainage basins of the Snake and Columbia Rivers. It was estimated that the equivalent of 66 80-acre farms went down the Columbia River every day for a month. That run-away soil, you will agree, could provide no security for a mortgage or any kind of a bank loan; nor can it ever again yield up its wealth in crops for the benefit of the farmers, business, or anybody else. It's lost, just as other millions of tons of once productive soil have disappeared down the waterways from Montana to California. No State, no nation, no business can withstand such losses indefinitely, neither can farmers.

And there certainly is no valid excuse for our permitting such dissipation of our capital landwealth to go on. We have perfected the tools of soil and water conservation in tried and proved practices and measures adapted to every kind of land we have. We have the most effective means ever devised for using those conservation tools to the best effect, through the soil conservation districts. And conservation farming has so thoroughly demonstrated its economy and profitableness wherever it is used that to ignore such an incentive to practicing it is just plain foolhardiness, in my opinion.

I could take up the time of this entire conservation session talking about how conservation farming pays, in an unbroken chain of dollars-and-cents and public benefits extending from the farmer on the land through his community to the entire State and Nation. In this same Palouse country, to give you one near-by illustration, some of our technical men, cooperating with specialists of the staff of the agricultural experiment station here at Washington State College, have studied the books of conservation farmers and compared them with the books of a group of similar farmers who haven't become too deeply interested in conservation as yet. Results of 2 years' performance studied show that these conservation farmers outstripped the nonconservation farmers on an average (on the farms studied) by \$22 an acre better income per year.

Based on reports from district farmers all over the country, it has been estimated that in 1948 (the only year for which the calculation has yet been made) the Federal Government retrieved the entire amount spent by the Soil Conservation Service and, in addition, a 77 percent profit in increased income taxes paid on increased returns as a result of farmers' applying effective soil conservation measures to their lands. The estimated gain included increased revenue derived from the profits of conservation farming, plus the extra income paid by retailers, processors, and distributors who profited directly from handling the increased production from soil conservation farming.

These and many, many more illustrations I could give are, I am sure, convincing indications to you as practical men of finance of the economic advantages and desirability of having a 100 percent, nationwide soil and water conservation program in effect on the land as quickly as we can. We have been moving ahead steadily, and at a faster pace than we could have dreamed of 15 years ago, but there is no question but that we need to go forward with this vital work still faster in order to get the big job done in time. If the technical and other necessary facilities are made available, we figure that the

job of applying the basic conservation measures on the land could be completed in about 20 years. After that, of course, would be the continuing job of maintenance, and the improvement of measures through continuing research.

The active interest shown by the banking fraternity, out here in the West and elsewhere over the country, unquestionably has contributed substantially to the progress already marked up in this whole conservation movement, and I know will continue to do so. I wish I had time to mention the many examples of this which have come to my attention from your own States. Off-hand, I think of a few such instances as these:

State bankers association activities, such as the Washington Association's conservation-farmer awards plan developed some years ago and the Idaho Association's plans for banker-farmer meetings throughout the State this coming spring and summer, as announced by Chairman Hart Hansen of its agricultural committee; donation of prize money for the North Palouse Soil Conservation District's jingle contest a couple of years ago by the Palouse branch of the Old National Bank of Spokane and the State National Bank of Garfield, Wash., newspaper advertisements carried for years by the Waterville, Wash., branch of the National Bank of Commerce of Seattle; the active backing given the Latah Soil Conservation District by the First Trust & Savings Bank of Moscow, and the Idaho First National Bank of Moscow, purchase of affiliate memberships in the National Association of Soil Conservation Districts by the Bankers' Association in Whatcom and Skagit Counties in Washington; time taken by bankers like Mr. Kelly of Republic, Wash., to serve as honorary member and financial adviser of the district board of supervisors; financing of the local soil-conservation district's 1948 annual report in booklet form by the bank at Wenatchee; arrangement for and remodeling of office space for the Sprague-Harrington Soil Conservation District by the Harrington, Wash., branch of the Old National Bank; encouragement for renters to develop conservation plans on land owned by bankers like Mr. E. C. Johnson of the State National Bank at Garfield, Wash.; and how Mr. Elmore Busch of the Old National Bank at Rosalia, by urging one of his farmer customers to go to his soil-conservation district and get information about a conservation farm plan, prompted the supervisors of the Pine Creek and Southwest Spokane districts to get our Service to set up a 3-days-a-week branch office provided by Rosalia businessmen to service local farmers.

I want to emphasize again, in calling attention to these constructive conservation services which bankers can render and are rendering, the important use which every one of you bankers can make of conservation farm plans. When Mr. Brown and Mr. Burdette were in to see me, they said they feel that the conservation plan made by the districts with assistance of our Service technicians would constitute an important and useful part of the individual farmer's credit record with his banker, and would enable the banker, in turn, to be of more assistance to the farmer in getting his plan applied and maintained. Of course, the local banker's obtaining a copy of an individual farmer's plan would be a matter between the banker, the farmer, and the district, but Service representatives assisting districts will help the banker get a copy of the farm-conservation plan where mutually agreeable arrangements can be effected.

Meanwhile, I should like to suggest in this connection that it would be most helpful if every banker who deals with farmers and ranchers would have a representative farm plan, possibly bordered by a few photographs of principal local conservation measures as

they appear on the land, framed and hung over his desk. Then if a farmer from within a soil-conservation district comes in, but doesn't have a district farm plan of his own, the banker can talk to him about the advantages of such a plan. And if the farmer customer is not in a district, the banker can talk of the advantages of getting such a district organized so that such conservation facilities will be available to him and his neighbors.

I know that many of you have seen and used the fine booklet issued by the agricultural commission of the American Bankers Association in 1947, on What Bankers Can Do About Soil Conservation. But any of you who may not have referred to this excellent publication will find it to your advantage, I think, to make it one of your every-day reference items on your desk. It sets out in understandable fashion most of the A B C's of banker cooperation in soil conservation, including use of these farm plans. And Mr. Brown has just written me that the ABA agricultural commission expects to stress to all agricultural committees of State bankers' associations the desirability of having banks contact their local soil-conservation districts and getting a copy of the farm-conservation plan to put in the farmer's bank-credit file.

Let me say again, that to complete the soil-and water-conservation job in time calls for a program of positive action, in which groups such as yours have a natural interest. It includes, among other points: (1) Completion of the national land capability inventory at the earliest date facilities will permit; (2) completion of the organization of the Nation's agricultural lands into soil-conservation districts, and strengthening district responsibility and work—with a scientifically developed soil conservation district plan applied by a conservation farmer to every farm and ranch in the country at minimum public cost; (3) active participation by all interested rural and urban groups—business, professional, and patriotic—in achieving Nation-wide conservation; and (4) making a real conservationist of every farmer and rancher in the country.

This is a goal I know we can achieve by working untiringly together.

Adjustment of Postal Salaries

EXTENSION OF REMARKS

OF

HON. GEORGE P. MILLER

OF CALIFORNIA

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 20, 1951

Mr. MILLER of California. Mr. Speaker, I am pleased to urge the adoption of H. R. 244, as reported by the committee, and hope that amendments to reduce the salary adjustments will be defeated.

This bill, H. R. 244, was introduced by me on January 3, 1951, the day the Eighty-second session of Congress convened. My action in introducing this bill was prompted by the very critical need of our postal employees for an immediate and substantial adjustment in their salaries in order that they might meet the increased cost of living. Their last salary increase was effective November 1, 1949. I desire to direct the attention of the Members to the fact that this salary increase was only \$10 a month and failed in a large degree to

meet the needs of the postal employees at that time.

The committee, after extensive hearings and due consideration, has made certain amendments to the bill but has retained the major principles that were the original basis for the bill. As amended, the bill provides the following:

Salary increase: (a) Grants to 500,000 postal employees salary increases of \$400 for all such employees paid on an annual basis, except fourth-class postmasters, who will receive a 20-percent increase. Hourly employees will receive a 20 cents an hour increase.

Raises entrance salary: (b) Eliminates the first three grades for all employees and renumbers the remaining grades in sequence, beginning with No. 1. This increases the entrance salary by \$300. When combined with the provisions for salary increases it raises the entrance salary for clerks, carriers, and motor-vehicle employees from an annual rate of \$2,670—\$1 31½ per hour—the present rate, to an annual rate of \$3,370—\$1.66½ per hour. Rural carriers presently receive permanent appointments and are appointed in grade 3. Their entrance salary will be increased by one grade.

Grade increases: (c) Grants two grade increases to those employees who have entered the postal service since July 1, 1945, and have not received any grade increase by operation of law counting increases under this bill. Grants one grade increase to those employees who have received only one such grade increase. Employees advanced in grade under this section will still retain their time in grade toward their next promotion.

Other provisions: (d) Provides that increases under this act shall not be counted as equivalent increases in compensation within the meaning of the Classification Act of 1949, so that employees who might be transferred to the Classification Act, such as transfer of buildings to GSA, will not be denied within-grade increases when due.

(e) Is retroactive to July 1, 1951, but shall not apply in the case of employees who have been separated from the rolls on the date of enactment, with the exception of those who are in the Armed Forces or who have retired since July 1, 1951.

There has been reference made to provisions in the bill which have been termed erroneously, in my judgment, "fringe benefits." These are not fringe benefits to those who are directly affected by them. In the first place, there are those who term the retroactive date of July 1 a fringe benefit. The retroactive date was placed in the bill to assure postal employees that despite the fact that time might be taken in the final enactment of their salary increase it would be retroactive to the beginning of the present fiscal year and they would not be placed at a disadvantage solely because of delays in legislative procedure. The retroactive date would probably have been more realistic to the situation had we made it retroactive to January 1 of this year, and there was ample testimony before the committee to justify such a retroactive date.

The elimination of the first three grades is no fringe benefit, since I am sure that the Congress generally was of the belief that at least the first two grades had been eliminated by Public Law 428 of the last Congress. Through interpretation, however, it was determined that the first two grades were eliminated only for regular employees. The bulk of employees, such as clerks, carriers, motor-vehicle employees, and railway-mail clerks, enter the postal service as substitutes, and they are today still entering in grade 1. In addition, the so-called Whitten amendment requires that all employees now be hired on a temporary basis. This means that except for postmasters and rural carriers, who have been administratively excepted from the Whitten amendment, all employees now must enter in grade 1. This bill eliminates grades 1, 2, and 3 for all employees and renumbers the grades so that the new salary schedules present uniformity and accurately reflect salary rates. By the elimination of grades 1, 2, and 3 and the \$400 salary increase, the entrance salary to the postal service is increased by \$700. Based upon testimony given by the Postmaster General, such an increase in entrance salary is necessary in order to attract and maintain the high type of employees necessary to carry out this important Government function.

The provision in the bill which will promote employees to one or two additional grades if they have not had such promotions by action of law will correct an inequity that has existed since 1945. This inequity resulted from a failure on the part of Congress to increase the entrance salary for employees in the postal service when a general salary adjustment was made for those on the rolls in the amount of \$400 a year. While this does not completely eliminate the inequity, it does recognize our obligation to do so and is a fair and reasonable adjustment for the employees who were not eligible for such promotion merely because they did not enter the postal service by a specified date.

Basically, of course, this is a salary increase bill to meet the increased cost of living with which our postal employees are faced. I am pleased, however, that the committee as well has concurred in the provisions of my original bill which will remove some long standing inequities to certain groups within the postal service. It is my sincere hope that the Members of the House will pass this bill without amendment and I want to give them the assurance now, both as the author of the bill and as a member of the committee, that all of its provisions have been carefully reviewed and, in the judgment of the committee, are merited by the employees.

I also want to point out that the House is considering today a bill which is complementary to this bill, H. R. 4255. This bill was introduced by my colleague, the gentleman from Louisiana [Mr. Morrison] and will bring about an adjustment in the salaries of postmasters and supervisors made necessary by the successive cost of living increases that have been made in the postal service which have

distorted the pay schedules of the postal service. Both the gentleman from Louisiana [Mr. Morrison] and myself introduced this legislation in the Eighty-first Congress and hearings were held, but because of the complexities of the problems involved, action was not then completed on this legislation.

There is presented, however, in the committee recommendation on H. R. 4255, a pay adjustment schedule for postmasters and supervisors which will eliminate to a large extent the inequities that have developed. This bill contains salary schedules for postmasters and supervisors in addition to the cost-of-living increase provided in H. R. 244 and adjusts salaries within a range of \$400. There is a limitation of total increase for any individual postmaster or supervisor, when combined with increases in H. R. 244, not to exceed \$800. This bill, since it is predicated upon the adoption of H. R. 244, as reported by the committee, is another reason why both bills should be passed without amendment.

Soil Conservation and Our Democratic System

EXTENSION OF REMARKS OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following address by H. H. Bennett, Chief, United States Soil Conservation Service, before the Virginia Federation of Women's Clubs, Roanoke, Va., May 3, 1950:

SOIL CONSERVATION AND OUR DEMOCRATIC SYSTEM

Today the future of thousands of communities throughout the Nation—and the continuing welfare of the Nation itself—hinges on the success of our efforts to safeguard our productive land and the water that makes land productive. Every interest in the country—the family, the school and church, business, industry, and civic groups—has a stake in getting the quickest possible solution to this problem. Further, when we think about it, we realize that there is not one individual in all the country who hasn't everything to gain from conservation and wise use of the land and nothing to lose.

I think I should say in the beginning that to me productive land is our base; for everything we do, all we share, even whatever we amount to as a great people and an enduring Nation, begins with and rests on the sustained productivity of our agricultural lands.

It is the thousands of communities throughout the country that represent the very foundation of our life, liberty, and security. When one or two, or twenty, or a hundred communities start going downhill because the land around them no longer supports the people, then the democratic system begins to suffer. When the people of the communities are deprived of the good standard of living they have been accustomed to, because of impoverishment of the land, they become dissatisfied, restive, unhappy. Some of them suffer from malnutrition because

they do not have proper land for producing healthful food.

LAND AND PEOPLE

You of the Federation of Women's Clubs understand, I am sure, the significance of the community in relation to the well-being of State and Nation. As individuals, your basic work is performed in your own home towns or country districts, among people you know well; yet you must continually think out and plan projects that have an important bearing on the security and future life of the Nation as a whole.

You know a good deal about our country's democratic system. You know, too, that it is not just government. It is what Thomas Jefferson called "the spirit of our citizens" which can make "government a model for the protection of man in a state of freedom and order." Those words are as true today as they were a century and a half ago, when Washington and Jefferson were laboring to set a young nation on the right track and at the same time doing all they knew how to do to prevent loss of soil from their Virginia farms.

Today we have the same problems, but in far greater magnitude and scope. And, in addition, we have many other problems. But none is more urgent than the saving of our productive land. If we should allow our source of livelihood—our land and the water that makes land productive—to be wasted to the point where the spirit of our citizens would become broken and apathetic, or wrathful from fear and want, then we could no longer say that we live in a "state of freedom and order."

I do not believe any such thing is likely to happen to us, certainly not in the foreseeable future. We can avoid it altogether, I am convinced. I know we can, if we speed up our soil-conservation program throughout the whole country, allow nothing to interfere with its progress, and devote time and effort to educating the people, especially the youth, in the fundamentals and absolutely necessity of conservation.

LAND AFFECTS ALL OF US

Wherever you go, tomorrow or in years ahead, whatever you plan to do, you can scarcely avoid becoming more and more aware of the importance of productive land in the economy of our Nation and the world. People have always depended on the land and other natural resources for their very existence.

From our earliest days here in the United States we have been blessed with such natural wealth in the form of productive land, water, forests, grasslands, and wildlife that too many among us have come to look on these basic essentials as inexhaustible. But we have learned that this is not true, and we have started programs to conserve and make the wisest possible use of these resources. Now, as they are becoming increasingly scarce in relation to our needs and our growing population, I think we can feel hopeful that our national interest in conservation is going to mount steadily.

While it is not meant that we are going to go hungry any time soon, nevertheless we must keep in mind the fact that we definitely do have a limited supply of productive land, and we must from now on take scrupulously good care of all of it. We must keep this in mind ourselves and take steps to see that others—all our people—understand it. We have surveyed and studied our land rather thoroughly in the past few years. We now know with considerable accuracy how much we have for production of cultivated crops, for forests, for livestock, and other essential uses. There isn't a great deal to spare, in proportion to our needs, and there isn't any to waste.

It is, I think, extremely important that all the people know the facts about our soil and water resources. Some may ask: How does this land problem concern me? I am not a

farmer. Isn't it the farmers' business to look after the land?

It is, of course, the farmers' job—something farmers should look after. But suppose they don't? Or, suppose not enough of them look after the land in time, or look after it well enough? Suppose they don't know what to do. Who, then, is affected?

The answer is clear: Teachers, scientists, lawyers, doctors, and the members of all the other professions will be affected; and manufacturers, also, and the people who run the railroads and airlines; and bankers, merchants, and still others. Probably the housewives and their families will be affected most. All these will be affected as consumers, distributors, processors of the things that are produced on the land. What happens to the wheatlands of the Great Plains, the ranges of the West, the cotton fields of the South, and the orange groves of Florida, California, and Texas is quickly reflected in the business of Pittsburgh, Denver, Minneapolis, Richmond, and Roanoke.

Shredded wheat, Camels, Ivory soap, Stetson hats, Florsheim shoes, and Cannon towels all come originally from the soil. So do newspapers, baseball bats, pancakes, and a long list of other articles we use and depend on from day to day. Think of all the people who depend wholly or partially for their income—their living—on the processes involved in getting grains of wheat from Kansas or the Dakotas to the breakfast tables of New York, San Francisco, and Roanoke in the form of biscuits, hot cereal with cream, and hot cakes. There is the farmer, and the manufacturer of the machinery the farmer uses. And there are truckers, millers, advertising men, stenographers, bankers, bakers, carton manufacturers, ink makers, salesmen, wholesalers, retail workers, railroad workers, and so on and on. All of this long chain of farming, manufacturing, processing, packaging, marketing, and distributing is made possible because seed planted in the soil multiply, become edible and nutritious, and ultimately reach us in the form of usable products.

There is even more to the chain. The farmer, the trucker, the railroad engineer, the stenographer, the carton manufacturer, and all the rest who contributed to producing the shredded wheat and the flour of which the hot cakes and biscuits are made also buy goods and services. These people go to doctors, dentists, lawyers, barbers, and beauty parlors; they go to movies and ball games and the opera and the symphony. They buy newspapers, radios, automobiles, electric light bulbs, washing machines, and houses. They hunt and fish and make pictures. Their taxes help to build roads, bridges, hospitals, dams for irrigation projects, battleships.

And back of it all is productive land.

I am afraid millions of people never think of all these products, and hundreds of others, in their relation to the land of our country. Instead, most of them associate such things with the stores where the processed articles are bought. Wholesome-looking, attractively packaged things appear on store shelves. They are for sale. They can be had for so much money. Why should the purchasers be bothered about what happened before the articles got into the store?

People will begin bothering themselves only if the articles become scarce, if the price gets too high, or if the quality becomes too poor. And all these things can happen—have happened locally—where there's a shortage of productive land.

Even more important, we can change from a strong nation to a weak one if we neglect our land. History as written has more or less overlooked what has happened to nations that allowed their productive land to wear out—to wash or blow away.

WHAT MAN WILL DO TO AVOID HUNGER

There are numerous illustrations throughout history showing to what extremes man

will go under the lash of hunger in order to get a patch of ground for the production of food. Prodigious labor, raiding, robbery, murder, and war can be included in the list.

On the steep slopes of Lebanon there can be seen today the remains of stone-walled terraces, some of which were probably built more than 3,000 years ago at great cost in labor.¹ These terraces were built in order that the ancients could farm the land—every possible acre. Much the same sort of thing can be seen in Peru and about Tenancingo, Mexico, and in the hills and mountains of France, Italy, and the islands of the Mediterranean and neighboring seas.

I wish more people could see what I saw on a recent trip to Europe and Africa. It would help, I am sure, to understand better the full significance of productive land and to what lengths man will go to find a spot on which to produce some food for himself.

In Italy, for example, every available patch of land along the roads I traveled—practically every square foot—is in use. From the beaches of the Adriatic and Mediterranean on up to the crests of the Apennines and Alps every usable sliver of land that I saw was devoted to crop production. Tens of thousands of little patches are cultivated on slopes so dizzyly steep I wouldn't venture into them. Mountain sides have been propped up with staircase benches supported by rock walls and filled in behind with soil brought in by the basketful. The work required in establishing this bench type of agricultural land translated into American labor costs probably would amount in many instances to \$15,000 or \$20,000 an acre.

And in forested areas when trees are cut, even the twigs are saved for fuel, along with the weeds of fields.

When population presses on the land, people often become more thrifty with respect to nearly everything but soil—the very thing they should do most to save.

When one talks to Italians about the cost of their stone-walled terraces, the reply is likely to be something like this: "Why consider the cost when land means food? Food is life, lack of it is death."

In a sense, they are right, of course. In America we have not approached any such land scarcity. And quite properly we always figure carefully the cost of our conservation work on the land. There are many reasons why we must be practical and realistic in all that we do, but I am bothered sometimes by the fact that we seldom consider the cost of not controlling erosion.

SOIL LOSSES

Within the last two decades we have built up a broad program for soil and water conservation, but we are still losing every year approximately 500,000 acres of cropland through misuse of land and wasteful methods of farming. I don't mean that 500,000 acres of United States territory is actually disappearing into thin air every year; but I do mean that that much cropland is being so damaged it will not be of any further practical use for growing cultivated crops in the immediate future. And this damage is the result of uncontrolled and unnecessary soil erosion. Already we have ruined for practical cultivation about a fifth of our original area of tillable land. Around a third of what remains has been badly damaged, and there is another large area on which erosion has already started. In addition, our surveys show that still other areas have suffered severely by waterlogging, accumulation of toxic salts, strip mining, and deposition of the debris of erosion.

When white men came to America, the United States was covered, on an average, with about 9 inches of productive topsoil. In the intervening years, that average soil

¹ Lowdermilk, W. C. Conquest of the Land Through Seven Thousand Years. U. S. Department of Agriculture, Soil Conservation Service, SCS-WP-32. 1948

depth, across the country, has been reduced to something like 6 inches—by erosion of cultivated land. On millions of acres the subsoil has been exposed; and in countless places much of the subsoil, too, has been severely eroded or cut to pieces with big gullies.

This concerns you and every American. And I am glad to be able to say that we can do something about it—and are doing something about it.

But, first, let me point out that we now have only about 460,000,000 acres of good, first-class cropland left. We must take care of this. About seventy or eighty million acres of this land must be cleared, drained, irrigated, or otherwise improved before it can be used for growing either small grain or intertilled crops. And, of the land now in cultivation, around 70,000,000 acres is too steep, too shallow, or too erodible for further safe cultivation. Of our good cropland, all but about eighty to one hundred million acres needs soil conservation treatment in varying degree to keep it safe from erosion while used for crop production.

As I said, this is everybody's job. It affects us all, and we can all do something about it. But as a Nation, or State, or community, we will conserve our remaining productive land and use it wisely only if there is a truly effective popular demand for such a course of action. The men and women and young folks of the towns and cities must help develop this demand, for they now constitute by far the largest segment of our population. If people will take the trouble to learn the facts about the land of their community, their State, their Nation, and then lend real support to conservation action—not with just talk and argument alone—then we will get results. What we want and need is permanent results in conservation, results right out on the land, and in the minds of the people. There must be conservation education. People must be brought to abhor land wastage as a disease. In our increasingly complex civilization, I see this as one of the public's urgent responsibilities. It also is an opportunity of great significance, for what can be of greater satisfaction than helping to speed and perpetuate a movement for conservation and improvement of the land that supports us?

OUR NATIONAL PROGRAM OF SOIL CONSERVATION

We do not need to become destitute of good land in the United States, in Virginia, or any other part of the country. We still have enough good land to get along quite well for a long time, if we take good care of it. We already have a national program of effective soil and water conservation underway, and we have made great progress in recent years. We need only to continue and intensify our efforts along the line of present work in order to establish a permanent conservation type of agriculture in this country. But we dare not "let down," get tired of all the work involved, decide it isn't necessary, and allow all our efforts to slide into the oblivion of wasted endeavor.

Soil Conservation and Our Democratic System

EXTENSION OF REMARKS

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the

RECORD, I include the following address by H. H. Bennett, chief, United States Soil Conservation Service, before the Virginia Federation of Women's Clubs, Roanoke, Va., May 3, 1950:

I truly believe—and many agree with me—that this Nation has made more actual progress in solving its land conservation problems during the last few years than any nation or people ever made in such a short time. It was just 20 years ago that we took our first positive step toward a national program of soil conservation. Through congressional authorization, we were enabled to establish a number of erosion experiment stations in various areas over the country to study in a really scientific way the processes and depredations of erosion and to work out methods of prevention and control. This, I think, was an historic milestone in the world's advancement of conservation science and technique. I consider it as of greater importance to mankind than the purposeless building of all the pyramids in Africa and Mexico or even the most worthy erection of all the monuments to our great men and women. These commemorations of our great leaders represent a splendid expression of our appreciation of their achievements and will have good and stimulating effect on our people. The difference is that protection of our basic natural resources lies at the very base of continuing national existence.

SOIL CONSERVATION DISTRICTS

In the 20 years since we began developing soil and water conservation techniques, with a view to getting those techniques used on the land, we have, I think, come a long way toward our goal. We have developed the science of soil and water conservation. We have put soil and water conservation measures on more than a hundred million acres of land for farmers and other people to see and measure the advantages and benefits. We now have as a great field for this work some 2,200 soil conservation districts, covering about 1,200,000,000 acres and including about 4,500,000 farms and ranches, or more than three-fourths of all the farms and ranches of the Nation. Twenty-two of these districts are in Virginia; they cover nearly 22,000,000 acres of the State's land—86 percent of the total—and include 142,799 Virginia farms. Just because farmers have organized these districts does not mean that all the land in them has been protected as yet. Really, we have just made a good start. The big job is still out ahead.

Farmers in these 2,200 soil conservation districts, throughout the country, are working together, planning together, pooling their resources, and helping one another as they never have done before. They have organized their own soil conservation districts—voted them into existence under State laws—to conserve and improve their land, to stop soil erosion, and to adopt land uses based on scientific principles.

It is this kind of strictly voluntary and understanding cooperation, initiated and carried on by the farmers and ranchers themselves, without any outside interference or dictation, that is doing so much toward getting this tremendous job done, and done on time—before we lose too much of our remaining productive land. And this kind of cooperation is probably the most effective way—if not the only way—to bring about permanency of the conservation practices we are putting on the land. No one has shown me anything even approximately as effective as the soil conservation districts for getting this work on the land and keeping it there.

PROGRESS

The Soil Conservation Service, which I have had the honor to direct since its incep-

tion more than a decade and a half ago, makes virtually all of its technical assistance and certain other assistance, including that in flood control, available to farmers through their soil-conservation districts. Up to January 1, 1950, approximately 800,000 complete soil-conservation plans had been prepared in districts alone. These plans covered 220,000,000 acres of farm and ranch land, and 114,000,000 acres had been treated with needed conservation measures by that time, in the districts. These figures do not include other millions of acres surveyed, planned, and treated through other programs in which the Soil Conservation Service has assisted. And up to the start of the current fiscal year (July 1, 1949), detailed conservation surveys adequate for farm planning had been made on 304,000,000 acres, and reconnaissance surveys helpful in farm planning had been made of another 177,000,000 acres. We need these land surveys because it is the only way we can scientifically determine the capabilities and needs of the land. The data collected by the surveys are used in farm planning in such a way that what we do fits the land and the farm.

Our soil-conservation work is speeding up. The records for 1949 show that the Soil Conservation Service, working with farmers in the districts throughout the country, completed 18 percent more conservation work on the land than in the previous year.

You might, I believe, like to hear something about soil-conservation progress in Virginia. I hope everyone in this audience is familiar with at least some of the soil- and water-conservation practices that are especially adapted and needed in this State. That is an important step in educating ourselves and others for appreciation of well-cared-for land—to be able to see the land as our basic and utterly essential resource and know when it is properly used and cared for, or when it is being misused and damaged.

In Virginia's 22 soil-conservation districts, containing more than 14,000,000 acres of farm land, 20,166 farmers now have complete soil-conservation plans for their farms. And 18,337 Virginia farmers, whose farms add up to a total of 3,281,892 acres, are carrying on complete conservation farming, according to plans, right now, this spring, as they prepare to produce this year's cultivated crops, manage their woodlands and pastures, and use that much of Virginia's farm land according to conservation practice designed to be permanent. This more than three and a quarter million acres now undergoing conservation treatment is only a little more than a fifth of the farm land in the State's soil-conservation districts. I sincerely hope that in another year the amount of farm land completely treated for soil and water conservation will have doubled, or tripled.

As you can see, we still have a tremendous amount of work to do in the Virginia soil-conservation program. We are moving ahead, but still not fast enough. For one thing, our district farmers need encouragement. Any time and effort the citizens, both urban and rural, can devote to helping and encouraging them will be well spent.

Of course, many other Virginia farmers have started soil-conservation work. There now are many excellent soil-conservation practices well established on the farms of the State. Of the cultivated land 278,000 acres are contour farmed, cover cropping is used on more than 231,000 acres. Farmers have strip cropped nearly 131,000 acres and are practicing stubble mulching on more than 267,000 acres. About 500,000 acres of the farm woodlands of our State now are managed and utilized for soil and water conservation and for sustained yield of woodland products. And, I hope you will look, this spring, for some of the 630,000 acres of green pastures in the State's soil-conservation districts—for that acreage has been greened up by methods designed to

renovate old, worn-out, eroded pastures, or to make new pastures with grass and legume seedings mostly on fields severely damaged by years of the wrong kind of cropping and farming methods. The district farmers also have built 1,720 farm ponds, 4,600 miles of terraces, and have completed conservation drainage of 54,300 acres of their farm land for more efficient use of water and to control soil erosion. Much other valuable work has been done on the farms in the districts, but these are a few practices I hope Virginia people will look for and appraise this spring and summer, and in the fall after harvest, and next winter when the conservation practices will still be visible, especially in their erosion-control values and their effectiveness in community improvement.

EVERYBODY CAN HELP

To me it is encouraging that the women of the Virginia Federation of Women's Clubs are sincerely interested in promoting soil conservation, as well as other good works, in this State. I know this is the case, because for the past 4 years your Federation has been conducting a conservation camp for people who have participated in a conservation contest or some other conservation activity. I know that some of the Soil Conservation Service technicians located in Virginia have had a part in this excellent work, by giving instruction both in the camp's class room and in the field. The conservation tours, which have been arranged for the entire camp, have reached out to the work of farmers in soil conservation districts. This is the kind of support and co-operation for soil conservation that helps. It is a civic group taking the initiative, and at considerable cost and effort making it possible for people to be really useful in promoting land conservation.

It is because I know of your interest and desire to help this work which means so much to us all, that I feel I can speak plainly to this group today. Although our progress in soil conservation is encouraging, it still is not going fast enough. Instead of getting 20-odd million acres of land in soil conservation districts treated with conservation measures each year, as we have been doing in recent years throughout the country, we should be completing the treatment of considerably more than that each year, in order to finish the application of the basic soil conservation measures on time, before we lose too much good land. This could be done by 1970 or 1975 if everybody takes a hand.

We can, and we should, move ahead faster toward this urgent goal of soil and water treatment of every important area of land in our country that needs treatment. Essential to progress is teamwork of all elements of our society. People working together through the active participation and efforts of all interested segments of the public, rural, and urban alike, will accomplish far more than can be done in any hit-or-miss manner, without plan or definite goals. I believe there should be some serious thinking and discussion, by all individuals and groups, as to just how and where a particular individual or group can expend effort most advantageously in helping to speed this indispensable work on our land and make it permanent.

We know now what our land problems are. We have perfected efficient tools for practical and scientific soil and water conservation, and we have the soil-conservation districts through which to put these tools to work most effectively. We shall have nobody to blame but ourselves—the citizens of the United States—if we permit our land and water resources to go on wasting away any longer. This is still the most urgent, basic, and important job confronting the people of the Nation and the world.

CONSERVATION EDUCATION, URGENT AND ESSENTIAL

Education undoubtedly is the most powerful force for good at the ready disposal of mankind. Certainly, this is true in a democracy such as our own. Conservation is done by people. It will not be done unless the people understand how to do it and why they should do it. And our soil-conservation endeavors of today will not be permanent unless the people of both today and tomorrow are well informed about our limited land resource and the urgent need for taking good care of it.

We have many educational forces working today. We have our schools and newspapers and magazines, radio, the churches, public forums, and numerous other agencies that do a great deal toward forming public opinion. Many of these agencies could rightfully be called educational institutions. But we have only one institution that reaches practically all the people, in all the big and little communities where our democracy has its roots, and gives them—or can give them—systematic instruction on the fundamental arts and sciences essential for their becoming well-informed citizens. That institution is our public-school system, supplemented in some places by parochial and private schools. These schools, in which almost every boy and girl of the Nation spends a major part of his or her early formative life period, are the backbone of our educational system. The knowledge, thoughts, and habits of American youth are molded largely by the classroom training of these schools. I don't think I am exaggerating when I say that the future welfare of thousands of our communities, of our Nation—even our civilization—may well depend on whether or not the boys and girls of our schools are given the opportunity to develop the right conservation attitudes and habits as they move from grade to grade in these schools.

I do not claim to be an authority on teaching. But I do have some definite ideas about what we should teach in the way of soil conservation—if we really want soil and water conservation to be a permanent thing in our country. I would like to mention some of those things to this audience in particular, because you are closer to these schools, through the children, than any other adult group, and because your influence is a thing to be reckoned with in our educational system, especially at the community level. And too, I know that in recent years the sponsoring of soil conservation has become an important phase of the work as set forth in the resolutions of the National Federation of Women's Clubs. This year, I believe, one of your new resolutions has to do specifically with education for soil and water conservation in the schools.

SOME FUNDAMENTALS OF CONSERVATION EDUCATION

I think that every child, whether living on a farm or in a city or town, should be taught some of the fundamentals about our soil and water resources, and the need for their wise use and conservation, as rapidly as they are capable of understanding the concepts and facts. And, this really is very early. We teach honesty, cleanliness, thrift, virtue, and self-reliance as a matter of course. We teach the principles of democracy, tolerance, and free thought and speech as fundamentals of our American way of life. I think we ought to teach conservation of soil and water in the same way that we teach these other fundamental principles and practices. Conservation of our indispensable soil and water, and our other natural resources, must become a part of our way of life. The issue is: Shall we continue to exploit and deplete the land and other resources we have left; or, shall we conserve them while we use them?

The answer, of course, is: We want to conserve them while prudently using them. We must then make sure, without delay, that the youth of the Nation are trained as citizens who will insist on conservation, will demand it, and will practice it while they live or help others practice it.

I would like to enumerate a few of the fundamental principles of conservation which I think should be taught to every child as soon as he is able to understand the simple principles involved.

1. Most of what we eat comes from productive land. Most of our food, clothing, and other things we need and use are manufactured through the complex forces of sunlight, air, water, and soil synthesized by the plants that grow in the soil. This thin layer of productive soil that covers part of the earth's surface is the main source of our sustenance.

2. Our other natural resources are not indestructible. They can be wasted or ruined for further practical purposes by imprudent use. In fact, many of these resources already have been seriously depleted or impoverished, especially our productive land.

3. We do not need to waste our land while we use it. We can conserve the land and make much of it still more productive while using it, if we but follow conservation methods instead of wasteful methods of land use.

4. Many farmers are already conservation farmers and more are taking up the practice of soil and water conservation every day. In our country we have the scientific knowledge necessary to enable all farmers and ranchers to become conservationists. Although we have a highly successful nationwide program of soil and water conservation under way, many farmers still follow the more difficult, wasteful, and exploitative way of farming, and for this reason we are still losing good land every year.

5. Our water resources, like land, are being wasted, too, by overuse and failure to check losses by excessive runoff. This loss of water can be stopped only by putting more of the right kind of soil- and water-conservation practices in the right places. These fundamental matters should be thoroughly instilled into the mind of every child as a part of his normal way of thinking. Nor should we stop there. All young people in rural areas should be taught some of the techniques of soil conservation as rapidly as they are able to grasp and apply them. And the teaching should go on through high schools into our colleges. We should never stop teaching it. It should be taught, wherever feasible, even to all adults, regardless of where we find them. What we really want to do is to get soil conservation into the bloodstream of our youth—into their habits.

Education for soil and water conservation is taking the long view instead of the short one. It is building for a good life in our Nation throughout the centuries to come. It is my hope and expectation now, after a lifetime of effort for soil conservation, that the people will see to it that our soil-conservation program which is now moving ahead with such remarkable effectiveness does not become ineffective and wasted for lack of conservation education among the people. Lastly, there is no logical cause or excuse for not providing this future security to our Nation, our States' economy, our community welfare. Our soil-conservation program, in Virginia and in all the country, helps all and hurts no one. While safeguarding the land, it returns, in addition, more dollars to the Federal Treasury than are taken out of the treasury as a working fund.

In the year 1728, Col. William Byrd II, when surveying the Dan River Valley of Virginia, wrote in his diary: "Rivers roll down their waters to the sea as clear as

crystals." I think it is conceivable that streams in our watersheds may again run clear, and in that event he will not have proved a poor prophet when he further wrote, "Happy will be the people destined for so wholesome a situation, where they may live to the fullness of their days with much content and gaiety of heart."

Could Eisenhower Win?

EXTENSION OF REMARKS

OF

HON. EDWARD H. JENISON

OF ILLINOIS

IN THE HOUSE OF REPRESENTATIVES

Monday, September 24, 1951

Mr JENISON. Mr. Speaker, while it might be said that the choice of a Republican candidate for President is a purely partisan problem and therefore not a proper subject for consideration in the RECORD of the Congress, such is not the case. Americans, as a people and a Nation, are weighing all the candidates with the hope of finding the most suitable leader in the critical years ahead. They should. And they should have the benefit of all the available information on those who may be considered.

For that reason I am including in the CONGRESSIONAL RECORD a revealing article published in the September 24 issue of the Freeman, entitled "Eisenhower: The Bait and the Trap." Written by Lawrence E. Brown, it relates the Eisenhower boom to the Republican dilemma as regards the basic issue of national survival.

Under permission granted by the House, I present it for the thoughtful consideration of my colleagues. It follows:

EISENHOWER: THE BAIT AND THE TRAP

(By Lawrence E. Brown)

The maneuvers to capture the Republican nomination for Eisenhower are reminiscent of those that so disastrously captured it for Willkie. There is the same synthetic publicity accepted as evidence of mass popularity, the same approval by the liberal and forward-looking elements of the Republican Party (that is, by the eastern suburbs), the same slightly craven despair of the professional politician who wants to win with anybody and accepts a candidate's own publicity as evidence of his political strength.

There is even a faint resemblance between the men as individuals: The same air of boyish masculinity, the same public doubt concerning their understanding of political realities, the same narrow competence inflated out of all proportion by public misunderstanding of their real responsibilities. Despite their outward air of craggy, individual strength both men have owed their fame to others—Willkie to the Wall Street group which made him a prominent lawyer, Eisenhower to the leftist faction of the Roosevelt administration which gave him his stars and his commands.

There is, however, a deeper similarity in the two candidacies. Both represent the efforts of the same faction of the Republican Party to cooperate with the foreign policy of the Democratic administration. The backers are men who profess objection to some of the domestic policies of the administration but approve its foreign policy. Their public plea, of course, is that only an

internationalist and forward-looking candidate can win the election. Privately they argue that the Republicans must nominate a "popular" figure, a man with glamour. The substance of their view, however, is their unwillingness to conduct a campaign on any issue at all.

They know that to exclude foreign affairs would be to exclude all real issues and merely replay 1940, 1944, and 1948. Hence their plea for a candidate with glamour. Willkie was supposed to have it. Eisenhower is said to have it. With this quality, it is argued, a candidate can get votes on his personality, not his clarity of purpose or understanding of the crisis in which his country finds itself. But the trouble with glamour is that though it may lead to popularity, which is only a fancy name for favorable publicity, it does not win elections.

Eisenhower, like Willkie, would be a natural candidate for the Democrats, but again that position has been preempted. Even more than Willkie, he is one of those candidates whose professional support is from people who are for him because they think some other people are for him. You meet many of the first, but few of the second. It might seem that so synthetic a candidacy would collapse after a little sober analysis by the professional Republican leaders. To envisage the kind of campaign Eisenhower could wage against Truman at once exposes its absurdity. Why should anybody vote for the obedient subordinate and reject his responsible superior?

HOW CAN EISENHOWER ATTACK?

Wherein can Eisenhower attack the Democratic administration? For those policies which he himself executed without a murmur? Obviously, he can not mention foreign policy beyond the vague cooperative generalities of Willkie. Can he campaign on domestic policies only? Hardly with success. First, he is marked as a man with no experience in domestic matters. Secondly, there is no domestic question that does not promptly bring in foreign questions. Taxes, the draft, Government spending, labor policy; none of these can be separated from the foreign crises that have sometimes been the cause and always the excuse for more than a decade of domestic issues. No candidate committed to the foreign policy of the Democratic administration can do more than be petulant about domestic questions. He would have raised the same vast sums for the same foreign purposes, but somehow he would have made the taxes lighter. He would have drafted and controlled the economy for the same objectives as his opponent, but he would have done it better. It is not difficult to see who would win the American voters in that kind of campaign.

It might be supposed that the impossibility of winning with Eisenhower would gradually dampen the ardor of his more practical backers; but it almost certainly will not, for the very good reason that to win is only their secondary objective. Their primary objective, as in 1940, is to continue the Democratic foreign policy. If Eisenhower can win, that will be fine. If he cannot, he will have accomplished what is to them his principal function: The occupancy of the Republican presidential nomination to be sure that no opponent of the Democratic foreign policy gets it.

This campaign within a campaign needs more attention than it gets. Its object is to prevent foreign policy from becoming an issue, and the Republican candidacy of Eisenhower is merely the certain insurance of success.

To suggest that the fate of the United States—its continuance as an independent nation or its submergence under Soviet conspiracy and ultimate conquest—hinges upon the presidential election of 1952 is to evoke undesired echoes of nineteenth century campaign oratory. It is curious that in the past,

when no election result could have touched the survival of the Nation, it was the style to say that it could, while today with the Soviet colossus bestriding the earth, fashion decrees that this fact must be considered irrelevant to an American political campaign.

This is the substance of the campaign for Eisenhower. It is also the accepted view of many eastern Republicans and, for entirely different reasons, of many of the one-time isolationists of the Middle West. It is also the view of most of the press and the radio. In this view it must be assumed that both parties are equally committed to defense of the United States against Soviet attack, equally unanimous in this commitment, and equally willing to employ what seems from moment to moment the best strategy of defense.

DEMOCRATS AGAINST AMERICA

The trouble with this view—which is the substance of the bipartisan foreign policy—is that the rise of the Soviet Empire cannot be separated from domestic American politics, because that empire was created not by its own might but by American domestic politics. Soviet world power did not just happen, nor could the Soviet Government have achieved it by its own efforts. That empire is the creation of the faction that for years has steadily increased in power within the Democratic Party. Despite the administration's verbal attacks on Communist aggression and its childish prosecutions of the inconsequential riff-raff of the official Communist Party, this faction is still able to protect its key men in the Government and to influence the major lines of American foreign policy.

These are the men who kept British and American armies out of Eastern Germany and the Danube Basin, not as the most expedient way of defeating Germany, but in order to give these lands to the Russians. These are the men who used lend-lease and UNRRA to increase Russia's postwar military potential. These are the men who turned over Asia to the Soviet empire preliminarily at Yalta and finally with Marshall's arms embargo against the Chinese Nationalists. These are the men who have blocked every attempt to remove Soviet agents from key policy positions in the government. These are the men who always oppose "Communist aggression" in speeches and always aid it with such of the political power of the United States as they can discreetly use for that purpose. These are the men who with another 4 years of power safely in their grasp can accomplish the final destruction of the United States before an irresistible Soviet world empire.

The fact that the Democratic Party as a whole never had such purpose is without bearing. Within the pro-Soviet faction there were enough men, powerfully enough placed in the government and the Democratic Party, to manage American policy in such a way that the Soviet empire grew to be the mighty power they desired it to become. They may have thought they were serving world peace or idealism, or the welfare of humanity, or that they were merely promoting their own political or military careers by working harmoniously with an obviously powerful element in the Roosevelt administration. Whatever their motive they created the Soviet empire and then disarmed the United States.

These are the facts, and any difficulty in understanding the motive of such men does not change them. It is not the motives of a prominent man of today but the commitments of an obscure, ambitious careerist of 20 years ago that are decisive. These men still control the dominant faction of the Democratic Party in all questions concerning Russia, and since the President appears to be their intellectual and moral prisoner, there is no possibility of loyal Democrats regaining control of their party.

True, the country does not know this; therefore, foreign policy seems a troublesome issue to many short-sighted Republicans who themselves have rarely thought through the process by which the United States became a groveling suppliant to Chinese and Korean agents of the Soviet Empire. True, the people as a whole know only that Russia has become an immense power and that we have become weak; that ever since 1943 the Soviet Empire has grown constantly stronger and more threatening. But they also know that everything that brings politics into their drily lives—high prices, the draft, Government controls, the Korean casualties, high taxes—in one way or another always comes back to the power and menace of this immense empire and the wordy but altogether ineffective counteractions of the administration. All they know, in essence, is that something is terribly, dangerously wrong.

The problem has not yet the status of a political issue because everyone who raises it is treated as a sorehead, a publicity seeker. It is not a party issue, and until it becomes one the evidence will be rarely printed and more rarely considered. But once it becomes a party issue, the overwhelming evidence placed against the public certainty that it is not right for us to be shamefully weak and the Russians dangerously strong will make it the most powerful political issue in many generations of American politics. Nor can there be any serious doubt about the way the American public would vote on that issue.

From the mere view of party advantage the question, therefore, arises why the Republican Party does not set to work to build this issue—the betrayal of American interests to the Soviet Empire—into the central theme of its 1952 campaign. Surely, say the naive apologists for the administration, if the facts were so damning, the Republican Party would not leave this field to the scattered efforts of a few Senators and Representatives. These apologists overlook the basic fact that in the realities of American politics there is no Republican Party, and until there is a nominee for President whom self-styled Republicans must either repudiate or support, there will be none. Until then, nothing can be a party issue.

REPUBLICANS AGAINST THEMSELVES

There are also two major factions within the Republican Party, the eastern internationalists and the one-time isolationists of the Middle West. That fact explains the reluctance of most prominent Republican politicians to force the issue of foreign policy into the election of 1952.

The difficulty that faces the one-time isolationists in raising this issue is not so grave as that which inhibits the eastern Republicans, but it is still a difficulty. A serious examination of the administration's pro-Soviet policies brings in question the entire policy of the United States in the recent war and even to some extent in the earlier war. It raises the question of war as an instrument of national policy, and this the one-time isolationists desire to avoid. In their hearts they object to the consequences of both wars, but instead of objecting to the political goals toward which the two wars were directed—a distressing, cold-blooded issue to raise in the emotional atmosphere of a democracy—they keep silent about their real grievance and object to war as such. Foreign wars, they see, have involved the United States in manifest disasters, and it is hard for them to credit the reality of a kind of war quite outside their experience. The United States was never before in danger, and they find it difficult to sense that it now is.

So this naturally nationalistic wing of the Republican Party are left in the quagmire of semipacifism because of their fallacious conclusion that no war can be really necessary to the life and welfare of the United States.

Thus they back into approximately the same position that the eastern internationalists occupy frontally and by choice—that no war of national interest should be fought because the purpose of world politics is not national welfare and survival but collective security and international peace.

But it is primarily the eastern internationalists among the Republicans who are unable to make Democratic betrayal to Russia the central issue of the 1952 campaign. These are the Republicans of the suburbs of the large eastern cities. They are by no means all the eastern Republicans, but they are the most vocal and command the most money and the best press. They are not only fearful of a strong nationalistic policy; they would deplore it as morally wrong. They have been well trained by the past literary generation to be more than a little ashamed of their own country and acutely conscious of whether they were fully abreast of the current intellectual style. Since for many years the intellectual fashion has been not only internationalist but even covertly leftist, only a Babbitt could be so hopelessly outdated as to concern himself with gaining crude practical advantages for the United States. That the survival of a state depends on the maintenance of its advantages would be too immoral a fact for them to recognize.

Naturally these Republicans demand that the party nominate a man with internationalist views, who will accept the current clichés of the eastern press and the slick-paper magazines about collective security and international cooperation. They cannot make a real issue of the rise of the Soviet Empire. They cannot admit to themselves that this empire is an immense power and a deadly menace. To do so would not only make nonsense of their pet international theories but establish the sound political judgment of men they have been taught to despise. It simply cannot be made respectable to expose the Soviet Empire and its American apparatus for what they really are. Too many prominent intellectual, literary, and academic figures would emerge tinged with political idiosyncrasy if not with treason. Too many eastern Republican politicians would look imbecilic for sitting on the sidelines through such a gigantic betrayal. If the truth about Hiss was hard for the eastern intelligentsia to take, the truth about the entire Soviet apparatus would be staggering.

BABBITT UP TO DATE

From these basic considerations comes the formula that the Republican candidate must appeal to the "forward-looking elements," the body of "liberal opinion" supposed to be attached to neither party. To do this, of course, he must be an internationalist and possess that vague but indisputable quality of intellectual respectability. He must have no part of the repute of a JOE MARTIN, a MCCARTHY, or even a TAFT. At the moment Eisenhower best fills the bill. The political fallacy of this opinion—which the Republican Party has accepted with known results since 1940—is not in point here, but the real meaning of the definition of the desirable candidate.

What is the practical mechanism for determining what Republican candidates could fill these specifications? Who presumes to speak for the forward-looking elements? Manifestly the liberal commentators of press and radio. Their names are familiar: Elmer Davis, Lippmann, the Alsops, Doris Fleeson, Stokes, Childs, Mellett, Pearson, Eleanor Roosevelt. Beyond these there are a few technically anonymous sources of similar views, the publicly unidentified editors of the Washington Post, the New York Times, the New York Herald Tribune, and the St. Louis Post Dispatch.

This group is the generator of what is accepted as liberal and internationalist opinion. Certainly it does not come from such "reactionaries" and enemies of the U. N. as

Fulton Lewis, Pegler, Sokolsky, Lawrence, Sullivan, Frank Kent, the editors of the Washington Times-Herald, the New York News, Chicago Tribune, the Hearst and Scripps-Howard papers. Could these men establish a man as either a liberal or an internationalist?

These two lists contribute the bulk of the political comment reaching almost all of those Americans directly reached by any political comment at all. The first interpretation of political events, the first character estimates of a man, reach public attention through these men and women. Roughly speaking there are no other important sources of political information available to the American people.

Now, since the second group listed above are considered completely reactionary, "liberal" political opinion is confined by simple mathematical elimination to the first group. They and they alone can speak for "liberalism" and the "forward-looking elements."

The question remains concerning intellectual respectability. Who can confer or withhold this label? Who has pictured Senator Vandenberg as a great statesman and Senator TAFT as muddled and reactionary? Who has unceasingly built up George Marshall and unceasingly belittled Forrestal and Louis Johnson? The point is not whether these views of American public men are correct or erroneous, but that they are held by people who think of themselves as liberals and internationalists—including a large group of eastern Republicans. The further point is that these are precisely the estimates of public men which the first group of commentators has promulgated for many years.

These being the sources of "liberal" and "internationalist" public opinion, these being as a whole the group that proclaims who is and who is not intellectually respectable in American politics, it is obvious that, if the Republican Party wants a candidate who conforms to these specifications, he must be a man generally acceptable to this group. Yet these political commentators have for nearly 20 years been almost the intellectual proprietors of the Democratic administration, thereby gaining a public importance that opposition could never have given them. For them to approve any Republican candidate except one foredoomed to defeat or certain to continue the same administration under a different party-label would be well beyond the elastic limits of human nature. Even if there were no question of harmony of political objective, their mere livelihood and public prestige require them to work for the continuance of the same basic administration in Washington.

This is the nettle that the Republican Party must grasp or it will again fritter away its efforts in a senseless, foredoomed election. It cannot have a candidate who will be considered liberal and intellectually respectable unless, like Willkie, he is already a prisoner of the Democratic administration or, like Dewey, doomed by the boredom and indifference of the reactionary Republicans.

Furthermore, if the Republicans want a candidate who will please the "liberal" commentators, what sort of campaign can he wage? For what can he attack the administration that will not bring down their abuse upon him?

Probably he could talk about Government corruption in minor offices—he could not mention the cost of the President's establishment. It is not liberal to get personal in politics except against the enemies of the Soviet Empire. Probably it would be permissible to deplore high taxes and Government expenditures. He could argue for restricted free enterprise and deplore the march toward statism. But can such a campaign win an election? Obviously no one is going to get very angry about it one way or the other. No one is going to feel that it is really vital to cast his vote for the Republicans. Those who do not object to the

present administration are not ignorant of these things. Reminding them of what they already know and discount will gain no votes.

Nor would this sort of campaign be of any use with those opposed to the administration. They, too, are a little cynical about political virtue. It is not for sins but for vast crimes that they detest this administration, even though they sense them rather than know them in precise detail. To go to people who are mortally worried for the life of their country, who are sick with dread at the prospect of the vague disasters that this administration seems to bring ever nearer, to go to these people with chatter about RFC scandals, the need for sound money and a free economy, or with opposition to creeping socialism, or any other superficial, wordy campaign that would not shock the liberal commentators, is simply to conform them in their despair.

THE WAY TO DEFEAT

For the Republican Party to refuse to pitch its whole campaign on the Russian policy of the United States is to insure its defeat. The vast growth of Soviet power is implicit in every problem disturbing Americans. Everyone is aware that the Roosevelt and Truman administrations had something to do with the growth of that power. Some think they deliberately aided its growth, knowingly contrary to the interests of the United States. Others think they honestly miscalculated, honestly blundered, but generally did the best they could. But everyone is aware that Soviet power has become immense. Everyone is aware that this power today is a danger. For the Republicans to ignore this danger, to fail to make it the central thesis of their campaign, is to ignore the only issue to which people will pay serious and consistent attention because it is the only issue they know is real. It is the only issue upon which the Republicans can get enthusiastic voters, and without them the election might as well be conceded.

A campaign on the pro-Soviet record of the Democratic administration would at once be labeled "dirty." It would be the "McCarthyism" so deplored, and so dreaded, by the Democratic high command and by every "liberal" commentator. This might seem on its face to recommend it to the Republicans—as it perhaps does to the bulk of the Party—but it seems to terrify the pundits of eastern republicanism. They are willing to win but not at that price. Yet that price may be the survival of their country.

MacArthur Chosen as Favorite Hero

EXTENSION OF REMARKS

OF

HON. W. J. BRYAN DORN

OF SOUTH CAROLINA

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. DORN. Mr. Speaker, Douglas MacArthur is the greatest American of this generation. In spite of his removal from command he is still considered by Joe Stalin as the No. 1 enemy of communism. No smear campaign can shake the faith of our people in General MacArthur. The following is an Associated Press story from New York:

MACARTHUR CHOSEN AS FAVORITE HERO

NEW YORK, September 23.—American boys and girls have picked Gen. Douglas MacArthur over the late President Franklin D. Roosevelt and Babe Ruth as their favorite hero, past or present, according to a boys athletic league survey.

Salary Increases for Federal Employees

EXTENSION OF REMARKS

OF

HON. GEORGE P. MILLER

OF CALIFORNIA

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 20, 1951

Mr. MILLER of California. Mr. Speaker, I am pleased to urge the adoption of H. R. 339, the bill presently under consideration that provides a much-deserved increase for Federal employees who are subject to the provisions of the Classification Act of 1949, dentists, doctors, and nurses in the Department of Medicine and Surgery of the Veterans' Administration, officers and employees in the Foreign Service, and officers and employees in or under the legislative branch.

Our committee conducted extensive hearings with respect to this legislation as well as the other two bills which were approved by the House on September 20, 1951. It was established that, in order to provide Federal employees with an increase which would offset the increased cost of living since 1939, it would be necessary to provide a 20- to 25-percent increase in salary.

More than one-half of the Federal employees covered by this legislation are today receiving less than \$3,200 per annum. The members of our committee, including myself, believed that a flat increase of \$400 annually, retroactive to July 1 of this year, would offset a major portion of the increased cost of living.

This flat increase would provide a 15- to 20-percent increase for most of the Federal employees who are receiving less than \$3,200 a year.

Never before in the history of our country have Federal employees been called upon to supplement their salaries by seeking additional employment on Saturdays, Sundays, and nights to the extent they are today. In most metropolitan areas private industry pays from \$400 to \$600 more in salaries to their employees occupying comparable positions. I do not believe that the Government service should lag this far behind private industry in the treatment of its employees.

The committee rejected the proposal for a percentage increase on the ground that lower paid employees would not receive an adequate salary adjustment. It is the employee in the lower bracket who is starting out to raise a family and who today is most seriously affected by the increased cost of living. Such employees are entitled to a greater measure of consideration than is accorded those in the higher salary brackets who received more substantial pay increases under the adjustment provided in the Classification Act of 1949.

We in the Congress have a high moral responsibility toward those who work for our Government. They are entitled to more than just a subsistence wage. They are entitled to the same standard of living that others enjoy.

Recently, I have heard many general criticisms concerning Federal employees and the charge has been made that they

are idlers, lack integrity and do not give full measure of work for the pay they receive. Nothing could be further from the truth. These unjust criticisms have a tendency to undermine the morale of Government employees. In many cases this criticism has driven efficient employees from the Government to seek employment in private industry. In addition, this unfair and unwarranted criticism has made it increasingly difficult to attract employees into the Federal Service.

Increases in the compensation of Federal employees cannot be opposed upon such an untenable argument. The \$400 annual increase which is provided for in this legislation is the least that should be granted, in order to make the minimum adjustment which is necessary in the take-home pay of Federal employees.

I trust the Members will support this legislation and not agree to any amendments other than the elimination of Section 1 (e) which provides that nondefense Government agencies should absorb the cost of this legislation within their 1952 budgets. This is an unfair provision which was adopted by our committee by a narrow margin. I am hopeful that the House will eliminate it from this bill. The amendment was designed to reduce the cost of the legislation, but, in fact, it will provide that many of the employees who are entitled to the increases will never receive them. Only by a reduction in personnel will sufficient funds be available, in most nondefense departments and agencies, for the payment of the salary increases provided in the bill. Salary increase legislation should not contain such an unworkable provision.

Use of Atomic Weapons in War

EXTENSION OF REMARKS

OF

HON. OLIN D. JOHNSTON

OF SOUTH CAROLINA

IN THE SENATE OF THE UNITED STATES

Wednesday, September 26, 1951

Mr. JOHNSTON of South Carolina. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD a very excellent address by the senior Senator from Connecticut [Mr. McMAHON], chairman of the Joint Committee on Atomic Energy, at the Federal Bar Association's dinner in honor of the Judicial Conference of the United States, held at the Mayflower Hotel, Washington, D. C., on September 25, 1951.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

Ladies and gentlemen, it is an honor to be among this distinguished company, and I appreciate your inviting me.

The many members of the legal profession here tonight know what it is to spend weeks writing a law brief, only to find that, when the finished document has at last been placed before the court, its issues and problems cannot be forgotten and still dominate the mind. I happen to have just finished preparing a brief which cost me some months

of work and study—as a matter of fact its roots go back more than half a decade—and I submitted this brief to the United States Senate last week. Since I am human enough still to be thinking about it, perhaps you will permit me to address myself to its subject matter and to expand somewhat upon my remarks to the Senate.

I proposed an atomic army and an atomic navy and an atomic air force, in place of the conventional defenses we now maintain to the tune of fifty or sixty billion dollars a year. I asked that we get about the business of building up our atomic bone and muscle and cutting away what will become excess military fat.

It was my suggestion that we spend at least six billions per year upon atomic energy, and thus for every dollar so spent save \$5 worth of the conventional armaments we will no longer require. I pointed out that atomic weapons actually numbered in thousands or tens of thousands are capable of being made, and if they are mass-produced, each one will come to cost less than a tank. I also pointed out that atomic fire power is hundreds of times cheaper, dollar for dollar, than such ordinary explosives as TNT.

My argument to the Senate was simply this. We can best deter the Kremlin from war, we can best buy time to wage peace, we can best guard our economy against the inroads of limitless military spending, we can best do these things by stepping up our atomic effort at least to the \$6,000,000,000 per-year level and by cutting down our conventional effort to a figure many billions lower than the sixty to eighty billions that otherwise threaten to become the price of survival.

Since my brief is being considered in the court of high strategy at the Pentagon, and in the supreme court of American public opinion, it may be well for me to mention some of the things I did not say. Certainly I did not say, for example, that we can ever afford to do without conventional forces. On the contrary, I expressly stated my belief that, although conventional forces are far more expensive than the atomic weapon, we will always need them. We will always need them if for no other reason than to compel an enemy to mass his troops, and thus convert those troops into a target worth our use of a tactical A-bomb.

Those who would like to think that a future war could be fought in comfort, from the back seat of a Cadillac, will find no support in my remarks.

Neither did I say that the atomic weapon can perform military miracles. On the contrary, I indicated that it is a military white elephant unless delivered accurately on target, and delivery is an expensive and difficult proposition. It is for the very reason the atomic weapon is not magic that I called for its production on a huge scale, just as we would mass produce a superb conventional weapon.

Likewise I declared my opposition to any one-weapon theory of warfare. Because no single type could ever do the military job, I advocate a sweeping variety of atomic weapons, an atomic shell, an atomic mine, missiles with atomic warheads, nuclear-powered submarines, radiological agents, torpedoes with atomic payloads, tactical A-bombs and strategic A-bombs, and, of course, the accomplishment of the most terrible instrument of all, the hydrogen bomb. We must have one atomic model that makes unnecessary a hundred depth charges, another that takes the place of a thousand bazookas, yet another that would substitute for TNT stacked as high as Pike's Peak.

Only thus can we bring about a real revolution in deterring power; only thus can we be sure of buying time in which to multiply our efforts for peace.

By the same logic I hold no bias in favor of the Army or the Navy or the Air Force

as the service ideally suited to use atomic weapons. As I put it to the Senate, we must have truly balanced, well-rounded, and versatile forces, with each arm equipped to exploit the atom to the utmost.

Today the United States Atomic Energy Commission has in being or under development or study literally dozens of different types and kinds of special purpose atomic weapon models. Some are for one branch of the service, some for another, some for all three. This is just as it should be.

In my Senate address, I deliberately avoided any reference to the nuclear-powered aircraft. Such an aircraft, I believe, is feasible. It will become a reality in the future. But it is not sufficiently immediate—not near enough on the horizon—to be included in the picture of an atomic army and an atomic navy and an atomic air force that I tried to paint. For similar reasons I deliberately avoided referring to possible tactical uses of the hydrogen bomb. These, too, are something which any realist must anticipate in coming years. Yet I wanted to bridle over backward in confining myself to the weapons and strategy and tactics and timetables that are visible, not in any way remotely, but soon.

The so-called wonder weapons I am talking about are not something to be fulfilled in the dim and misty future. They are not something today little more than a gleam in the eye of scientist wizards. They are down-to-earth hardware proven, demonstrated, and confirmed under combat conditions 6 years ago at Hiroshima and Nagasaki. They are practical gadgets actually proof-tested at Bikini and Eniwetok and Las Vegas—or to be proof-tested this fall and next winter and next summer and the year after.

You may ask me this question: If I am right in holding that we can purchase far more security at far less cost by stressing atomic energy, why were we forced to appropriate \$60,000,000,000 in the present fiscal year for national defense? My answer to you is quite simple: Except for the atomic stockpile already in existence and already planned, I estimate that we would have been compelled to spend as much as \$100,000,000,000 upon conventional forces in order to balance and checkmate Russia's armed power. Already the 3 cents in the military dollar we now devote to atomic weapons buys 25 or 50 cents worth of security. That is why I propose we multiply our atomic program; a mere 3 cents in the military dollar for our best and cheapest weapon impresses me as unreasonably and imprudently small.

Of course, I must caution that our Armed Forces cannot fight on promises alone. They cannot fight in 1952 with atomic material which will not exist until 1954. There is a lead time of about 3 years involved here—3 years before atomic plants and factories begun today can start producing the end product. In the meanwhile our conventional forces must be maintained at a level consistent with the likelihood of war and the threat from Russia.

But as early as next year important savings can be made—by cutting back upon the conventional arms and the conventional forces which themselves would not be ready for 3 years. The year after next, still greater savings are feasible on the same basis, until the transition from conventional to atomic defenses is complete.

What I propose is basically as simple as using gunpowder instead of crossbows, steamships instead of sailing ships, machine guns instead of muskets, tanks instead of horsemen. It is inevitable that atomic firepower will someday replace conventional firepower in American's arsenal. I want this process speeded up and accelerated. For the sake of the free world's security, for the sake of preventing war, for the sake of rescuing our people from the enlarging burden of debt and taxation, I want the United

States to put aside costly preatomic defenses and take up the cheap superweapons that forced imperial Japan to surrender with millions of troops still in the field and still undefeated.

The way to start such a program is to start it. The way to get ahead is to make sure that at least six billions for atomic munitions is available next year. Work upon the added atomic plants must start at once.

This is the best weapon we have got. Let us make the most of it just as fast as we can. If we do, we can save important amounts next year, bigger amounts the year after, and still more the year after that.

As a matter of fact, we have no choice whatever but to build our defenses around the split atom. Here is the only way we can fully exploit our superior science and technology and industrial know-how. It is in this area that we enjoy a clear-cut advantage over the potential enemy. In sheer bone-crushing manpower—in the ordinary conventional weapons—the Soviets have a giant capacity to generate military power. There is no certainty that we could forever match them tank for tank, gun for gun, division for division. But in the atomic type of competition where it is brain against brain, test tube against test tube, process against process—we can continue to outstrip the Soviets and deter them from war as far as the eye can see into an uncertain future.

Stalin, observing our advantage in the atomic field, had sought through propaganda to disarm us of that advantage. He has sought to convince the world that his best weapon, the conventional Red army, is highly moral whereas our best weapon, the unconventional atomic bomb, is highly immoral. We would be less than honest with ourselves if we did not recognize that Stalin's propaganda has had a measure of success.

One reason for this success is a belief that the atomic weapon must inevitably destroy the guilty and the innocent alike—that in knocking out a war plant it also knocks out noncombatants. Actually our military men have always regarded the bomb as a precision weapon to be used only against specific targets vital to the enemy war machine. If any proof were needed, it may be found in the fact that we spend as much as \$250,000 on each bomb-sight—so that in war, we could aim with precise accuracy at a precise military objective.

But do you think that the citizens of a slave state, knowing their dictator had launched an aggressive war, would remain in the vicinity of a crucial war plant? Would they report for work despite their knowledge that the plant might well attract an atomic bomb? Or would they seek refuge in safer surroundings—far from the centers of war production?

I would expect freemen to stick at their industrial posts. I would expect the citizens of a democracy to confront any peril without flinching. But I would also expect the members of a slave state, unless chained by their lathes, to put as much distance as possible between themselves and any vital munitions works servicing an aggressive war machine.

Apart from these factors, however, a stepped-up atomic program in the United States means stepped-up ability to strike at enemy troops—at soldiers in uniform. Such a program can reduce the phony appeal of Stalin's propaganda to the effect that atomic weapons are only good against civilians.

This leads me to the problem of deterring not only a big war but little wars as well. Along with Winston Churchill I believe that our already existing atomic stockpile has been the main factor in preventing Stalin from starting a full-fledged global conflict. But the atomic stockpile has not prevented Stalin from starting little conflicts in Greece and Indochina and the Malay States and Korea.

There are those who tell us that we must constantly maintain huge outmoded forces like those used in World War II—just to win the little conflicts. If this theory is right, we can never hope to hold down the military budget—we can never hope to survive at bearable cost.

I believe that we can work to the point where cheap atomic weapons will help us deter or win the little wars no less than the big war. I believe that the time will come, if we set about to make it come, when the tactical A-bomb in great numbers and wide varieties can hold at bay whatever small armies threaten to attack anywhere along the margins of Communist power.

By the same logic the defense of Western Europe appears in a fresh and hopeful light. People on the Continent have long feared that, if war came, the Red army would overrun their homes and cities. They have been horrified at the thought of being first occupied by Russia and then liberated by the United States after a fearful struggle across the broken remnants of European civilization. Now our friends abroad may hope to keep out and hurl back the Red army, not only with their own troops and planes but also with the help of the tactical atom.

Former Secretary of Defense Marshall, in one of his last actions before leaving, officially assured me that the potentialities of future improved weapons in defending Western Europe are under close and continuous study by our military planners, including the Joint Chiefs of Staff as well as General Eisenhower. With the aid of atomic energy we may truly anticipate the date when, at minimum money cost, the forces of freedom will own the power to contain and defeat any thrust from the East.

There is another tactical use for atomic bombs which I must mention because it may well turn out to be our best shield and protection against an aggressor's atomic attack upon America's own cities. The United States Air Force has officially announced that it cannot hope to intercept and shoot down more than 30 percent of enemy planes carrying atomic weapons to America. Our civil-defense program, although dangerously lagging today for want of appropriations, is another means of partially coping with the enemy's atomic threat. There remains the method of launching a rapid and massive atomic counterattack directly at the bases and military springboards from which the aggressor strikes. The lives of millions of Americans might be spared if, before an enemy could loose atomic destruction upon them, his own offensive force were itself crippled with American atomic bombs.

But there is another and pleasanter reason why I advocate that we step up atomic production. The material used in bombs is the very same material which can also be used to fuel the peacetime industrial reactors that will drive dynamo and propel commercial ships. Plutonium and U-235—the stuff of atomic weapons—never become obsolete either for military purposes or for peaceful purposes. Each pound of this material which we acquire is a precious asset which not only makes us strong from a defense viewpoint but which also promises startling progress under conditions of peace—if we can achieve peace.

By concentrating upon the reactors which help produce atomic energy material, we take out know-how insurance for peace as well as for war.

Ladies and gentlemen, it is a strange and somber world in which we must all ponder military issues the better to wage peace. It is a sad paradox that hideous atomic weapons offer themselves as the instrument to serve our noblest purpose—detering Stalin until at last his enslaved millions break their

chains and join hands with us in peaceful progress and brotherhood.

It is not for the defense of ourselves alone that we must multiply atomic production. Neither is it only for the defense of the free world. It is to gain time for all men of good will, on both sides of the iron curtain—time for them to unite in a common struggle against the tyranny of the Kremlin.

The earth's peoples must be told that an expanded atomic program is a reluctant alternative forced upon us by the aggressive attitude of the Kremlin, that our first desire is for peace.

The sole source of our danger lies in the fact that the Russian people may believe the lies of the Soviet Government that we are plotting to destroy them. If we take away this weapon of fear from the Kremlin leaders, if the Russian people are convinced of our peaceful intentions, the Soviet Government will never be able to undertake a war of aggression against us. The Soviet strategists continually denounce us as warmongers to keep their people in line.

In expanding our atomic program, we must again remind the world that the first and basic objective of our foreign policy is peace. We must again remind the world that these hideous weapons can be stripped from the arsenals of nations just as soon as the Kremlin masters decide that they want peace instead of war.

We can be sure that the word "peace" pays terrific dividends because the Communists use it constantly. They have convinced many thousands of honest people, who should be our friends, that we are imperialists plotting aggression and war.

If the world misunderstands our motives and our purposes, it is our duty to set the record straight. I believe that the announcement of a dynamic and generous peace program by us will be the finest weapon we can use in the struggle against Communist warmongering. I believe that if we talk peace, the peoples of the earth will believe us.

One place to talk peace is in the General Assembly of the United Nations, scheduled to meet next November in Paris. There let us galvanize the world through the boldness and sincerity of our insistence upon a fresh attack against the twin evils of our time—poverty and war.

I want to close by quoting four lines from *The Arsenal of Springfield*, by Longfellow:

"Were half the power that fills the world
with terror,
Were half the wealth bestowed on camps
and courts,
Given to redeem the human mind from
error,
There were no need of arsenals and forts."

Italian Peace Treaty

EXTENSION OF REMARKS

OF

HON. HUGH J. ADDONIZIO

OF NEW JERSEY

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. ADDONIZIO. Mr. Speaker, at this time when attention is being focused on the problems of Italy through the visit of her great leader, Premier Alcide de Gasperi, it is fitting that the Member's attention be drawn to the following resolutions on the Italian Peace Treaty and the return of Trieste

to Italy which were recently adopted by the grand lodge of the State of New Jersey, Order of Sons of Italy in America.

As the sponsor of the House Joint Resolution 224, Eighty-second Congress, urging that the Government of Italy be relieved of its obligations under the harsh treaty of peace of 1947, I am deeply gratified at the declaration of the United States, Great Britain, and France as to their willingness to renounce those provisions which hamper Italy's cooperation in western defenses. I know that the members of the Grand Lodge of the State of New Jersey, Order of Sons of Italy in America, and all the other American citizens and groups who have been demanding the revision of the unfair peace treaty are most happy at this recognition of Italy's hard-earned right to a position of equality in the freedom-loving family of nations. Those of us who have been striving for revision of the treaty have acted in acknowledgment of the fact that, as Premier de Gasperi pointed out in his eloquent address to the Congress, "an effective and most staunch alliance cannot exist without equality of rights and full recognition of the independence, sovereignty and dignity of a nation." It is in the common interest of all the members of the free world that no member be prevented from doing its full share in the common defense. It is therefore essential that an equitable solution to the Trieste issue based on the Anglo-French-American declaration of 1948 be reached so as to strengthen the unity and defense of Western Europe.

The text of the resolutions approved by the grand lodge follows:

Whereas our Government together with the Governments of Great Britain and France solemnly and spontaneously promised in March 1948, the return of Trieste to Italy, having recognized the unquestionable "Italianity" of that city, and

Whereas irrespective of the convenience of drawing Tito of Yugoslavia to our side, for which there is, however, no firm guaranty in the future, and

Whereas justice, democracy, and the will of the inhabitants of that territory impose upon our Government the moral obligation to fulfill its pledge to Italy, and

Whereas by now urging Italy to settle the Trieste problem through direct negotiations with Yugoslavia, our Government fails to carry out its solemn pledge. Now, therefore, be it

Resolved, That on the 7th, 8th and 9th days of September 1951, at the Forty-seventh Annual Convention of the Grand Lodge of the State of New Jersey, Order of Sons of Italy in America, held at Atlantic City, N. J., that the grand lodge of New Jersey (with membership of 8,600 persons) respectively urge the President of the United States and the Congress to reassure Italy for the United States without reservation and without qualifications that Trieste shall be reunited to its motherland, thus strengthening the resolve of the Italian people to share with us in all the sacrifices which both the United States and Italy will be called upon to make as members of the North Atlantic Pact; be it further

Resolved, That copies of this resolution be forwarded to the President of the United States, to the Vice President of the United States, to the President pro tempore of the

United States Senate, to the chairman and members of the Foreign Relations Committee of the United States Senate, and the Secretary of State of the United States.

Whereas the Italian Peace Treaty is a gross miscarriage of justice and contrary to every principle of fair play for which the United States stands; and

Whereas the material and moral assistance of Italy is necessary to combat the evil of communism; and

Whereas Italy cannot give such assistance if she is to remain chained and shackled by said peace treaty: Now, therefore, be it

Resolved, That on the 7th, 8th, and 9th days of September 1951, at the Forty-seventh Annual Convention of the Grand Lodge of the State of New Jersey, Order of Sons of Italy in America, held at Atlantic City, N. J., that the grand lodge of New Jersey (with a membership of 8,600 persons) respectfully urge the President of the United States and the members of the Senate of the United States, to bring about the revision of said peace treaty so as to accord by its terms a more humane, reasonable, practicable and just consideration of most important matters which are of importance not only to Italy, but to all democratic nations; be it further

Resolved, That copies of this resolution be forwarded to the President of the United States, the Vice President of the United States, to the President pro tempore of the United States Senate, the Secretary of State of the United States, and to the members of the Foreign Relations Committee of the United States Senate.

Crusade for Freedom

EXTENSION OF REMARKS

OF

HON. JOHN JARMAN

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. JARMAN. Mr. Speaker, under leave to extend my remarks in the Record, I include the following address by Gen. Lucius D. Clay, chairman, Crusade for Freedom. The Crusade for Freedom merits the support of all the people of the free world in our constant fight against communism. General Clay's fine address is a clear, forceful statement of the background and purpose of the crusade. I commend its reading to my colleagues.

Mr. Attorney General, General Parker, and friends, I am very grateful that you have come here today and that I have the opportunity to tell you a little bit about this Crusade for Freedom. It is a very simple story that I have to tell you, and I only hope that you can get some of the thrill out of that story that it has meant to me.

When the war ended in 1945, we didn't feel it necessary to embark upon a propaganda program because we had reason to believe that we were approaching a world of peace. Those of us in Europe soon found that a great wave of propaganda was coming from Eastern Europe, dominated by Communist thinking, purchased by Soviet money, as a part of the campaign to penetrate politically and to capture politically all of Europe.

In those days we had no Voice of America. Fortunately, our Government soon saw the wisdom of conducting a campaign of truth to dispel the campaign of falsehood, and the Voice of America was most effective in stemming the tide. However, it could not do it alone. It was the voice of Government, and as the voice of Government it had to operate within the rules of Government, within the dignity of Government.

In Germany we found that the Soviets were using their German puppets to speak to the German people, and that it was very difficult, indeed, to counteract their voices with foreign voices. Thus, as early as 1945 we started on a little program of our own in Berlin. There the great radio station Berlin was in Soviet hands. All we had was a 2½-kilowatt generator, which could only be heard by those who would hook their receivers onto their telephone wires. We expanded and increased the power of this set until we finally had a very powerful 50-kilowatt set, which was able to meet the voice of Radio Berlin. On this station we used selected Germans, Germans who had proven their faith in freedom and democracy by combating Hitler, and through those Germans we carried a message to East Germany which, in a subsequent poll, proved that our radio-band list had increased from 15 percent to 85 percent of the listeners who could be reached in the poll. This was a slugging match.

When I came home in 1949, I felt that there needed to be something else to complement the Voice of America, that there needed to be free radio stations in Europe to be used by those who had escaped from behind the iron curtain and who could, in their own language, describe to their fellow countrymen the life which existed in free countries.

I found in New York that a group of men under the leadership of former Ambassador Grew had developed the same thought and had created the National Committee for Free Europe for this purpose. It had been able to secure some funds from foundations and from a few individuals. However, to be effective, it needed the mass support of the American people. And thus was launched the Crusade for Freedom, the symbol of the crusade being the freedom bell, for throughout the world all time the bell has been the rally sound of people who were struggling for their existence. It has the same significance throughout the world.

Last year, as the Attorney General has said to you, 16,000,000 people signed the scroll of freedom and contributed over \$1,300,000, all of which went into the erection of Radio Munich, the most powerful radio station in all of Europe. In addition to Radio Munich, a short-wave station is operating at all times. However, the power behind that station is insufficient for it to override the effort of the Soviet and satellite countries to prevent it from reaching would-be listeners.

We need—and we need badly—two more stations as powerful as Radio Munich, one of which will be beamed 11½ hours a day, as is Radio Munich, to Czechoslovakia and to Hungary; the other will be beamed to Poland. We are already assembling staffs of Hungarians and Poles, recognized in their own countries, who will become the staffs of these broadcasting stations. In fact, we have so much confidence in what the American people will do that we have already ordered the equipment for these two radio stations.

Just a few days ago, we tried another experiment. It is very difficult for people living behind the iron curtain to know where to turn on their dial and when to turn on their radio to hear the radio stations of the

free world, not only the Voice of America and of Radio Free Europe, but BBC, the French radio, and many other of the European radios who are continually giving programs in the interest of freedom. Therefore, we printed these messages, on one side a message of freedom subscribed to by representative organizations from the free countries, and on the other side a radio schedule of the frequencies and times of all radio broadcasts in Europe. After careful experimenting, we had found that balloons could be used under the proper meteorological conditions to carry these messages within a comparatively short distance or within the area in which it was desired that they be placed. We have released experimentally one set of these balloons over Czechoslovakia, and we have just released another set over Poland. We already know from the underground that the balloons and the messages reached their destination and that thousands of the cards have escaped Soviet capture and have been distributed among the Czech people. We know that eight Soviet airplanes have been assigned the task of shooting these balloons down to prevent them from reaching their destination.

The Soviet fire and fury against Radio Free Europe, to which the Attorney General referred, and their action against the balloons is, to my mind, an indication of how effective these tools are. I might add that this year we are also organizing to undertake a similar program in Asia.

Once again I would like to make it clear that there is no competition between Radio Free Europe and the Voice of America. The Voice of America is essential; it has done a splendid job. It cannot be operated except with the dignity of government. It could not send balloons into a friendly country. The Crusade for Freedom has no such inhibitions. We can undertake the down-to-earth slugging contest. We can use the people known by the people behind the iron curtain to corroborate the story carried by the Voice of America.

I would like to say briefly that there are specific advantages to be gained from this program. Perhaps they are intangible, but nevertheless they are real. We must remember that in the satellite countries freedom ceased to exist in 1939. Many of those who knew freedom and who loved freedom have disappeared, first in the concentration camps of Hitler and now in the concentration camps of Stalin. Thousands of others have had to flee their countries to save their lives. That means that the younger generation knows of freedom only as it hears it from the outside. That means that if freedom is to be kept alive in these countries we must reach these young people. That we have done so is proved by the many evidences which we received from the underground. Suffice it to say that if war came tomorrow, the carrying of information behind the iron curtain has developed conditions under which, instead of being able to rely on hundreds of thousands of satellite troops, those troops, and perhaps additional Russian troops, would have to be maintained in striking distance of the satellite countries instead of being used in the war. And when stability comes, when it becomes apparent that there can be no hostile movement of troops against any country unless it is met with troops from other countries, then indeed these voices will have the opportunity to be raised to demand free elections, to restore democracy in the countries which have lost democracy.

Hope is essential to those who would still fight for freedom, and the Voice of America and Radio Free Europe combined to carry this hope. I would only like to add one thing. To be personal is perhaps bad taste, and yet

I hope you will forgive me. I have been a singularly lucky person, and within my life I have received honors far beyond merit for any services I may have rendered. When I heard the first voice over Radio Free Europe, a Czech voice, carrying a message to Czechoslovakia, and I knew that I was one of the 16,000,000 Americans who had made that possible, it was the most satisfying experience of my life. I do not apologize to anyone in asking them to help the Crusade for Freedom or to join the Crusade for Freedom, for if we believe in freedom, we are willing to do our part. And if we are willing to do our part, it is a high privilege to become a crusader in the cause of freedom.

My Report on the Japanese Peace Treaty

EXTENSION OF REMARKS OF

HON. KARL STEFAN

OF NEBRASKA

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. STEFAN. Mr. Speaker, days have merged into weeks since the signing of the Japanese Peace Treaty at San Francisco. Many of the other congressional observers have already reported on their impressions of what took place there. I have not. The implications of that treaty are so serious, so far-reaching, that it is difficult, even at this date, to bring its full significance into view.

At the outset, it is necessary to understand that the participating signatory nations foregathered at San Francisco for one purpose, and for only one purpose: To sign the Japanese Peace Treaty. The negotiations, the give-and-take, the concessions, the reservations—in fact all the preliminaries which go with the arrangement of a treaty—had been taking place between these nations for at least a year; perhaps for longer than a year. There was to be no debate at San Francisco. There were to be no amendments, no changes, at San Francisco.

What took place in the great west coast city can, and should be designated as "the above-surface phase of the Japanese Peace Treaty." We—the Congress and the people of the United States—know what happened during this phase. We do not know what happened during the below-surface phase, during which the treaty was slowly built into what emerged at San Francisco.

Let us examine briefly what we know before calling attention to what we do not know.

The signing of the treaty went almost according to plan. I say "almost" because the attitude of the Government of India, to whom this Congress and this Government had just granted a multi-million dollar "famine" loan, cast a shadow over the preliminaries.

Russia opposed the signing. Whether or not this expected move was made to encourage or discourage the swift acceptance of the treaty by this Republic is still a matter of conjecture. Russia has often employed the "double bluff" in its diplomacy. That is: It starts by opposing something which it really advocates.

Then, when the other nations—accustomed to resisting all Communist moves—rush to do what they think Russia does not want, they do exactly what Russia does want them to do.

As expected, the Soviet satellites echoed—almost word for word—the speeches of the Soviet delegation.

The alert listeners, the colorful participants, the precisionlike presiding of our Secretary of State, the tensions, the exchanges—the entire meeting—was ably, yes brilliantly, covered by American press, radio, and television.

Millions of Americans, and other millions of Europeans and Asiatics—through American informational media—were familiar with the palatial California home which housed the Soviet delegates, the very features of the chief British spokesman, and every word spoken in public by the presiding officer.

Truly, in the signing of the Japanese Peace Treaty at San Francisco, America had once again produced "the greatest show on earth."

Yet, with all of this tinsel, there was real triumph and real tragedy at the Japanese Peace Treaty meeting.

The triumph may well be that 49 nations have aligned themselves against further Soviet encroachment in the Pacific. That could still be a false triumph if Congress should learn some day that, of these 49 nations, the United States would have to carry more than 90 percent of the load of expendable men and money in future Pacific wars as we are today carrying in Korea.

The tragedy of San Francisco was and is that Gen. Douglas MacArthur—the prime factor in current good relations between Japan and the United States—was absent. It was General MacArthur who ably beat Japan, the enemy, to her knees. It was General MacArthur who governed Japan wisely and well in the interval between World War II and the Korean war. It was General MacArthur who, up to the time his abrupt dismissal, had kept communism in Japan at constant ebbtide.

General MacArthur, aside from the invitational difficulties advanced by our State Department, had his own reasons for staying away from San Francisco.

These are my general observations on what took place at the Japanese Peace Treaty meeting. What, then, are my specific recommendations?

My specific recommendations are:

First. Congress and the people should know the whole truth about the Japanese Peace Treaty; not the partial truth.

Second. The treaty should not be approved hastily. Every paragraph, every sentence, every word must be carefully scrutinized to prevent the lot of the American people from becoming increasingly difficult to endure.

Third. General MacArthur should be called to testify before open committee sessions of the appropriate congressional committee or committees upon the Japanese Peace Treaty.

Fourth. The treaty should not be approved if it gives Formosa to the Chinese Reds, or, in any other way, breaks up

the existing perimeter of our Pacific defenses against the encroachments of the Soviet Union.

Fifth. The treaty should not be approved if it carries any specific or implied promise that Red China should be admitted to the United Nations. Such an admission might bring Red China into membership on the Security Council.

Sixth. The treaty should not be approved if it makes our one-time ally, Chiang Kai-shek, an international outlaw.

If and when Congress and the people are satisfied that it is not a second Yalta, then, and then only, should the Japanese Peace Treaty be approved in the way our Constitution provides.

Whether the Japanese Peace Treaty is approved or whether it is rejected, let everything that is done be done openly, for all the people to see and understand. It has been 6 years from VJ-day, September 2, 1945, to September 21, 1951. If this treaty is a right thing, those who made it should not be ashamed of it. If it is a wrong thing, boys who are only 12 years old today should have the chance to know why, in 1957, they will be called upon to die.

The Greatness of America

EXTENSION OF REMARKS OF

HON. F. D. ROOSEVELT, JR.

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. ROOSEVELT. Mr. Speaker, under leave to extend my remarks in the RECORD, I am glad to call to the attention of my colleagues the following speech delivered by Mr. Millard Cass, special assistant to the Secretary of Labor and executive secretary of the National Labor-Management Manpower Policy Committee, at a Labor Day banquet in Henryetta, Okla., September 3, 1951.

I am particularly pleased to include in the RECORD this address by Mr. Cass, who is a former classmate of mine at the University of Virginia Law School:

THE GREATNESS OF AMERICA

(By Millard Cass)

Labor Day is a good time to take stock of ourselves.

We in the United States have made more progress in 200 years than the world made in the preceding 6,000 years.

For many centuries man has fought for food and freedom. Yet throughout thousands of years he failed to achieve either goal.

In 200 years we have achieved a standard of living that is the wonder of the entire world.

We have harnessed the forces of nature to do our bidding. * * *

We have conquered time and distance. We have taken the chains off the back of man and put them on nature. Man is now the driver rather than the driven.

We in the United States did not invent or even develop all of the great devices that make life easy for us. We do, however, make

more of them, use more of them, and distribute them more widely than any other people. The average American enjoys more luxuries and takes for granted more necessities than the wealthy people of other lands can obtain under any circumstances.

We in the United States have only 6 percent of the world's land area and 7 percent of the world's population. Yet we own: 72 percent of the world's automobiles, 58 percent of the world's telephones, 53 percent of the world's radios and television sets, 30 percent of the world's railway mileage; and we consume: 50 percent of the world's rayon, 43 percent of the world's rubber, 55 percent of the world's coffee, 47 percent of the world's steel, 54 percent of the world's oil, 42 percent of the world's aluminum, 38 percent of the world's cement, 25 percent of the world's sugar.

Two-thirds of the world's population have yet to enjoy what we regard as the simplest needs of civilization. They have barely enough to eat to sustain life. Their diet usually lacks food elements essential to health. Malnutrition is general and starvation common. Hospitals are few and badly overcrowded. Poor sanitation and an acute shortage of doctors, nurses, and drugs give these people an average life term of only 30 years. Illiteracy is widespread. Agricultural methods are primitive, and industry is practically nonexistent.

Our advances have not been limited to material things. We have more churches, schools, and libraries than any other nation. There is more laughter and singing here than anywhere else. There are friendliness, good will, brotherhood, and human sympathy among us. We give freely to any worthy cause. We forgive our enemies quickly and generously after the battle is over—be it an athletic contest or a war. We believe deeply and sincerely in the dignity of the individual. We have recently made great progress toward tolerance and understanding toward eliminating prejudice and discrimination. We are a deeply religious and moral people.

Why have we achieved so much more than the rest of the world? Why have we made material progress that dwarfs the accomplishments of other nations? * * *

We here in the United States have been greatly blessed * * *. We have abundant natural resources, a temperate climate, and, in general, all the natural advantages. * * *. We have a large country with lots of space. We have not yet faced the population problems that have beset others. We are separated by thousands of miles of ocean from the problems and misunderstandings that have plagued the Old World. We have been very lucky. For these blessings of God we are very grateful and very humble.

There are other countries, however, that also have been blessed with great natural resources and natural advantages. Yet over thousands of years they have not equaled the development that we have achieved in the short period of our history. We have become the greatest Nation on earth, while many of them are underdeveloped and backward areas.

There must be something, therefore, besides natural advantages which has been responsible for our great development. It is that something in which we can take pride.

I believe we owe our remarkable progress to a number of factors: It is our great democratic system, with its emphasis upon the rights of the individual, and the responsibility of Government officials to the voters. It is our freedom of speech, press, and religion. It is the supremacy of the civilian authority over the military. It is our free-enterprise economy, with its incentive for initiative and reward for achievement. It is hard work, perseverance, integrity, cooperation, and a sense of responsibility. It is the

fact that we had to work for what we got—that we had to carve our Nation from the wilderness. It is that we are a country of small homesteads instead of great feudal estates. It is our strong, free, democratic trade-unions which have encouraged industrial efficiency and promoted industrial democracy. It is that our country was founded and peopled by men and women who came here especially to live in a democratic society with a free and dynamic economy.

We have the most diverse population in the world. We are, as President Truman recently reminded us, a Nation of immigrants. Our attitude was once expressed by President Coolidge: "Whether one traces his Americanism back 3 centuries to the *Mayflower* or 3 years to the steerage is not half so important as whether his Americanism of today is real and genuine." Immigrants helped us grow strong and great. They made invaluable contributions in every field of endeavor. They helped teach us how to live at peace with all groups, all races, all creeds, and all nationalities.

We have succeeded also because we have realized that freedom requires sacrifices. You must give to get. You must pay for liberty—sometimes with work, sometimes with blood.

Our way of life has passed the tests of peace and war, prosperity and depression. Our political and economic systems have stood the test of time. They have accommodated themselves to changing technological conditions. Established in the age of hand labor, they have been equally effective in meeting the needs of our highly mechanized way of life. Our political and economic systems have * * * adjusted themselves to the changed relationships that grow out of being neighbors to people who once were 6 months away. * * *

The fact that our enterprise has remained free does not mean it has been unrestrained and uncontrolled. It has been regulated when the public interest required. We created national banks, put the control of our mails in the National Government, established free public schools, and restrained unfair competition and monopoly. We developed a national system of old-age pensions and created Federal-State systems of public employment services and unemployment insurance. We provided control of railroads, shipping companies, and airlines, inspected mines and meat, developed crop limitations where needed and farm subsidies where required. We established a public health service. * * *. We have set standards for the wages, hours, and working conditions of persons employed on many Federal contracts. * * *. We have Federal control of atomic energy. Public utilities, corporations, and insurance companies are subject to regulation. Municipalities frequently own their water supply, gas resources, electric power, or transportation systems.

As you can see, our economy is not absolutely free. Nevertheless, both our economy and our speech are the freest of any organized society in the world. Our great strength lies in our ability to limit them only where necessary and to restrict them only when the welfare of the public requires. In other words, we have adapted our democracy and our economy to meet the changing needs of the times, but we have maintained their essential character of freedom. That is why individual initiative has flourished under them, but individual greed has not been allowed to strangle them. We have remained freemen, politically and economically.

It is sometimes good for us to take a look at what American workers, American businessmen, and American farmers have achieved. * * *

No real champion ever rested on his laurels, however. That is true of the American

people. We are way out in front of the world. But we are still striving for a better way of life for all our people. We have the best Nation on earth, but it is not perfect. We shall, therefore, continue to try to improve the lot of all Americans.

Our production is still not large enough to satisfy our demands in peace or war. Small business needs continuing protection from monopolies. Too many of our people lack the benefits of our modern civilization. We are robbing our children of their heritage by wasting our natural resources. Millions of families are living in housing below our American standards. Millions more share their homes with others. Too many people are needlessly injured or killed at work and at play. The best medical care is out of the reach of many millions of our citizens. Consequently, the general health of our people has not kept pace with the remarkable progress of medical science. Our schools in many areas are too crowded and inadequately staffed. We still have too much child labor. We have a large amount of crime. The fruits of our great development are often denied to Americans because of prejudice and intolerance. In all of these areas there is room for great improvement. They are areas in which we should concentrate on making progress. If the past is any key to the future, I am sure we shall overcome our defects.

We find ourselves in a paradoxical situation. We are, on the one hand, confronted by the possibility of the most destructive war in the history of the world. On the other hand, we are on the threshold of * * * mastery of nature and ourselves. This situation is readily illustrated by the development of atomic energy. It has brought with it terror throughout much of the world. It has also brought with it real and valuable advantages.

Atomic energy can be used to preserve life or to destroy it—to produce medicine or to produce missiles.

We have already received numerous benefits from atomic energy.

Some of the most significant are in the fields of biology and medicine. For example, scientists have used radiiodine to treat people with an overactive thyroid gland. Surgeons have used radiophosphorous to locate brain tumors. The same radioisotope, phosphorous, has curbed excessive production of red blood corpuscles and has gained some degree of relief for patients with leukemia. * * *. Radioisotopes are proving of great value as "tracers," helping scientists to understand life processes and mechanisms which have been only partly understood until now. * * *

Much progress has also been made in the field of agriculture. Largely through atomic energy, more has been learned about fertilizers and their application in the last 3 years than in the previous 50. We are using radiocarbon to study how plants manufacture sugar from carbon dioxide and water with the aid of the sunlight. Radioisotopes are being used in research on plant diseases. * * *

In the industrial field, we have developed a very simple technique for measuring the thickness of materials. This offers economies to the manufacturer and better quality to the users. Lubricating oils have been improved by better understanding of what a lubricating oil does in minimizing friction. * * *. And, of course, there is the potential development of atomic power for industrial use.

On the other hand, we are developing newer and more terrible bombs and other weapons. Considerable progress has been made in the development of atomic engines, to propel submarines. * * *. There have been preliminary proposals to look into the

possibility of the dual production of cheap power and plutonium for weapons. And, as you know, the Atomic Energy Commission is carrying out the directive of the President to look into the possibility of building a hydrogen bomb.

We are trying to prepare simultaneously for defense and for peace. * * * The field of atomic energy alone gives you some idea of the kind of world in which we could live if peace were assured. I hope that, unlike Moses on Mount Nebo, we shall journey into that promised land.

We are on the threshold of the greatest era since the dawn of civilization. Life can be made rich, full, healthful, and happy for mankind. The future has great hope and great promise. Given peace, we can look toward horizons unlimited. All of us must work and strive for peace. In a world in which communism exists, any peace must be based upon strength—political, economic, and military. That is why we are arming for peace. That is why we are producing for defense. * * * We are the most powerful and most advanced country. The world looks to us for leadership. We are as aware of our responsibility as we are of our power. We are prepared to lead the world to peace through the United Nations. We can only hope that the whole world will join with us.

In Mussolini's Steps

EXTENSION OF REMARKS OF

HON. CARL T. CURTIS

OF NEBRASKA

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. CURTIS of Nebraska. Mr. Speaker, I think every Member of this body should read the following editorial from the Omaha World-Herald and see how it deals with the recent action of the administration in seeking to control the press of this country. The editorial appeared in the World-Herald on Friday, September 21, 1951, and is as follows:

IN MUSSOLINI'S STEPS

Freedom of the press is greatly cherished in America and is widely regarded as the strongest bulwark of all the other freedoms.

For that reason nobody, not even the lefties in Washington, ventures to attack it openly. Occasionally, however, little men who have been irritated by editorial criticism come up with snide and roundabout plans for limiting the press.

One such is now in the works. It is sponsored by the Office of Price Stabilization.

Under the present economic stabilization law, advertising is considered a proper business expense, and must be acknowledged as such by the OPS when it figures its price ceilings. The amount of advertising that may be done by each company, and charged as a part of the cost of its products, is left strictly to the judgment of the responsible executives of that company.

That system has proved irksome to some of the OPS bureaucrats.

They have asked Congress to give them the power to decide how much advertising each company under its supervision may charge to its selling cost.

Theoretically, of course, this law would affect only nonjournalistic enterprises. That's the slick part of it. In practice it would give the bureaucracy the right to decide how much advertising revenue news-

papers, magazines radio and television stations, or any other medium of expression, might receive.

As the Chicago Tribune recently pointed out, when Mussolini grabbed power in Italy, one of the first things he did was to limit the amount of money Italian business could spend on advertising. That wiped out freedom of the press in Italy. From that time on, until the dictator finally was strung up by the heels, every Italian newspaper and radio station was under the Fascist thumb.

You say it couldn't happen here?

Why not? Bureaucrats are alike the world around, and they easily become drunk with power. This one ill-advised law, if passed by Congress and approved by the Supreme Court, might be used in such a way as to force the entire American press to surrender to the administration or go bankrupt.

Know Your Waterways—Dangerous Neglect

EXTENSION OF REMARKS OF

HON. HENRY D. LARCADE, JR.

OF LOUISIANA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. LARCADE. Mr. Speaker, under leave to extend my remarks in the Appendix to the Record, I wish to submit an article from the Washington Post published by the Marine News, New York, N. Y., as follows:

KNOW YOUR WATERWAYS—DANGEROUS NEGLECT

With a coast line (Great Lakes included) of more than 30,000 miles the Nation has less than 200 improved harbors, and many of these have insufficient area and depth.

Of the \$498,382,400 total provided for the Corps of Engineers in the Army Civil Functions Appropriation Act passed on June 14, only \$14,164,500, about 3 percent, is for actual harbor and channel development at these 15 locations along a 30,000-mile coast line and at one point in Alaska:

Wrangell Narrows, Alaska.....	\$247, 000
San Diego River and Mission Bay, Calif.....	510, 000
Intracoastal waterway, Jacksonville to Miami, Fla.....	2, 150, 000
Savannah Harbor, Ga.....	370, 000
Calcasieu River and Pass, La.....	775, 000
Gulf Intracoastal Waterway (Algiers route).....	3, 900, 000
Baltimore Harbor and channels, Md.....	800, 000
Fall River Harbor, Mass.....	200, 000
Newark Bay, Hackensack and Passaic River, N. J.....	690, 000
New York and New Jersey Channels.....	1, 414, 000
Hudson River Channel, N. Y.....	250, 000
New York Harbor, N. Y., entrance channels and anchorage areas.....	400, 000
Houston ship channel, Tex.....	500, 000
Gulf Intracoastal Waterway (Galveston District).....	800, 000
Sabine-Neches Waterway, Tex.....	465, 000
Jacksonville Harbor, Fla.....	693, 500
Total.....	14, 164, 500

Two projects recommended by the Budget Bureau and estimated to cost \$1,621,000 were eliminated by the House Appropriations Committee; eight other projects were reduced by \$4,025,500; the all-important Hous-

ton Ship Channel being cut from \$1,500,000 to \$500,000.

Economy in Government was never more important than now. But almost complete elimination of expenditures for these permanent and indestructible assets which add to national strength, help the general welfare and are a vital link in the Nation's transportation system is not economy; it is dangerous neglect.

Protection Against News Censorship

EXTENSION OF REMARKS OF

HON. ALBERT P. MORANO

OF CONNECTICUT

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. MORANO. Mr. Speaker, under leave to extend my remarks in the Record, I wish to include an article by David Lawrence in the Washington Star of September 26, dealing with the menace to the Nation's free press imposed by the President's official decree empowering Government classification of news and information. I include also several of my own thoughts on this subject, including a recommendation that a permanent committee of the House and Senate be delegated to review any classified document which is the subject of formal protest by the press or radio:

IRON CURTAIN DESCENDS ON PRESS—NEW SET OF REGULATIONS ISSUED IN DECREE WITH PHRASEOLOGY AS SWEEPING AS ANY EVER USED IN A DICTATORSHIP

(By David Lawrence)

The iron curtain seems to have descended on the relations between the executive branch of the United States Government and the outside world.

A new set of regulations, in the form of an official decree, has just been issued with phraseology as sweeping as any ever used in a dictatorship. It constitutes, as the President admits, "for the first time, uniform standards for classifying and protecting security information throughout the executive branch of the Government."

But who is to say what is or is not "security information"? Why, the officials themselves, of course—the political appointees of a political administration. There is no penalty against the official or the agency of Government who, under the guise of "security," may be guilty of suppressing news to which the American people are entitled.

The new decree completely cuts off the Congress of the United States as well as the entire press—except as the Chief Executive may permit.

It cuts off "security information," arbitrarily classified, from every means of communication, written or oral, between persons in the employ of the Federal Government and the public, unless Government officials happen to know offhand what is or is not classified. Those officials will have to develop fantastic memory powers to obey the new rules. After 1 month of classifying hundreds of thousands of words, it will be impossible in such a maze of red tape for officials to be sure that they are not violating the President's official decree. Hence, the easiest course will be to say nothing to anybody—not even to a Senator or Representative—lest the ax fall on that employee for violating an Executive order.

In cynical disregard of the true effect of the new regulations, the President says:

"The order applies only to officials and employees of the executive branch of the Government. The public is requested to cooperate, but is under no compulsion or threat or penalty to do so as a result of this order. . . . there is no element of censorship, either direct or implied, in this order."

Certainly there is no censorship imposed in the form of a penalty on publication itself, but there is a penalty—and a severe one—in the censoring of the news at the source.

The American people have boasted to other nations that there is a "free flow of information" in the United States and that the Constitution declares Congress shall make no law "abridging the freedom of the press."

But the President apparently can make such a law by means of an Executive order bottling up at the source whatever news he wishes.

Everybody is anxious that really secret information of a military nature be suppressed. The American press through two world wars cooperated by voluntarily withholding from print all such information, whenever requested. But the new iron curtain order applies to every department or agency of the entire executive branch of the Government, and to every single person among the more than 2,500,000 employees, no matter in what bureau or city he or she is stationed.

Granting that certain regulations are necessary to protect really secret information of a military nature there is no reason why the Post Office Department or the Agriculture Department or the employees of the Fish and Wildlife Service or the clerks in any other department should be restricted in their telephone conversations, their letters or their communications with persons outside the Government.

What is conspicuously lacking in the new regulations is a system of checking against abuse. Each department head and the subordinate he delegates to perform the task of classifying information is a law unto himself. An interdepartmental committee on internal security is provided, but it has no real power of its own and it cannot exercise any effective check against abuse.

The potential enemies which the President fears might get information are not named, but it is suspected that perhaps the Republicans in Congress and the opposition press generally are now in that category, too.

For some strange reason, instructions are included in the iron-curtain order specifying how classified documents shall be destroyed. It must be by burning and not necessarily in the presence of more than one official. Just why it is necessary to give orders at this time in the new regulations as to how to destroy secret public documents is hard to explain. Since there has been no uniform system of classification in effect anyhow, the problem of destruction of documents ought to be academic, at least for some years to come. It may be that the Truman administration is getting ready to purge the records of anything that an incoming administration in 1953 may find politically damaging if there is a change to a Republican President.

The iron-curtain regulations deserve a thorough investigation by a joint committee of Congress composed of the committees on executive expenditures. For Congress still controls the purse strings. This means control over the use of Government money and over the conduct of officials who in the name of security would institute a complete censorship of Government information at the source. This new executive order is unprecedented in American history.

POINTS AGAINST THE CENSORSHIP ORDER

First. It is unnecessarily sweeping, giving authority to classify weather forecasts or crop reports, if some overzealous official may so desire.

Second. There is no appeal, anywhere, from capricious classification of routine news;

Third. Every department and agency is given blanket authority to cover up all mistakes and errors, simply by classifying the reports revealing those errors;

Fourth. Any report may be related to national security, on the ground that in some aspect it might reveal a developed program to the enemy.

One solution is to delegate a permanent standing committee of the House and Senate to review any document classified, when the press or radio files formal protest against such classification. This would at least provide a check against arbitrary and capricious classification of nondefense material.

In its present form, the order constitutes a violent and utterly un-American form of press censorship.

The order does not become effective for 30 days from September 26, 1951. In these 30 days, Congress may set up a safeguarding committee of review, by joint resolution.

Solicitation of Political Contributions

EXTENSION OF REMARKS

OF

HON. GEORGE MEADER

OF MICHIGAN

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. MEADER. Mr. Speaker, I desire to reply to a statement attacking me because I called the attention of the House of Representatives on Thursday, September 20, to the apparent solicitation of political contributions by the Democratic State Central Committee of Michigan from applicants for positions in the Post Office Department.

This attack is replete with inaccuracy, distortion and error. At least eight errors are contained in this statement with respect to which I wish to clear the record:

First. The statement infers that my comments have been issued through the Republican National Committee. This is untrue. All comments I have made publicly have been in the form of written statements which I have issued through my own office to the press or have inserted in the CONGRESSIONAL RECORD.

Second. The statement says that I charged that the Democratic Party in Michigan is selling jobs in the Post Office Department. I did not make this charge. I did charge that the Democratic State Central Committee of Michigan seemed to be exacting contributions from applicants for positions in the Post Office Department, and supported this charge with a letter from Howard P.

Hunt, finance director of the Democratic State central committee, which I inserted in the CONGRESSIONAL RECORD.

Third. The statement, having set up a straw man by putting words in my mouth which I never uttered, proceeds to characterize what I did not say as a political smear. If calling attention to improper methods of raising campaign funds through the solicitation of contributions from Federal employees is a political smear, then perhaps the word should stand. I merely suggest that those who engaged in such actions smeared themselves, and that any public official whose attention was drawn to such activities, and who neglected to urge that they be investigated, would have been derelict in his duty through winking at improper activities. My own characterization of the activities in question has been far milder than that of members of the Democratic Party itself.

Fourth. It is charged that I have reached conclusions before the evidence is in. The only conclusion which I have reached is that politics in the Post Office Department is bad business, and that the activities indicated by the letter of the Democratic State central committee ought to be investigated. If I had concluded that illegality or improper political activity had been established, there would have been no need for, and I would not have urged, an investigation by a congressional committee.

Fifth. The statement further implies that my demand for a congressional investigation was in response to a telegram from the chairman of the Republican State Central Committee of Michigan. I point out that my request for investigation was made about noon on Thursday, September 20, 1951, and that the telegram referred to is dated 9:08 p. m. the same day, and was delivered the following day. It undoubtedly was prompted by the correspondence and information I had supplied.

Sixth. The statement further charges that I have chosen to place all Michigan postmasters under suspicion because I refused to divulge the name of the person who corresponded with me in confidence and who, after my request, declined to have his name made public at this time for fear of reprisals. I will not be taunted into revealing the name of this informant to those who have a definite interest in suppressing evidence this informant might give or in punishing him for communicating with me.

Seventh. Whether or not the Senate Investigations Subcommittee ought to expand its inquiry to include all fundraising activities by both Democratic and Republican Parties in Michigan for the past 5 years is, of course, a matter for that committee to determine. However, this appears to be a red-herring technique to divert the attention of the committee from the more specific question of whether or not the Democratic State central committee is engaged in the solicitation of political contributions from post office personnel.

Eighth. The statement further recites that, so far, the author's inquiry has disclosed that only eight persons have

contributed a total of \$130.50. However, a quick check of the names of the 76 applicants for positions in the post office, whose appointment has been recommended since April 23, 1951, against the July 15, 1951, edition of the Green Book of the Democratic State central committee, lists contributors as follows: Of the 36 recommendations for appointment to postmaster, 13 are listed as contributors in the Green Book; of the 23 persons recommended for appointment as acting postmaster, 4 appear as contributors in the Green Book; of the 17 rural mail carriers recommended, 2 appear as contributors in the Green Book. It should be noted that these contributions, from evidence in my possession, are not necessarily connected with the letter of Howard P. Hunt, Democratic State central committee finance director.

A further check of the records of the Democratic State central committee by a disinterested investigative agency might disclose the connection, if any, between the Hunt letter and contributions recorded since the July 15 issue of the Green Book.

It is important to note that the practice of soliciting political contributions from post office employees on the part of the Democratic State Central Committee of Michigan is not new, and should not surprise officeholders of the Democratic Party in Michigan.

October 28-29, 1948, the House of Representatives Committee on Campaign Expenditures received sworn testimony in the city of Detroit from 21 postmasters, 4 acting postmasters, and 3 postal administrative officials, all of whom testified that they had been called on the telephone, often on Government property, by a man who identified himself as John R. Franco, chairman of the Democratic State Central Committee of Michigan. The report of that committee, filed with the House of Representatives on December 30, 1948, recited as follows:

Evidence and data developed by the committee investigation were referred to the United States Department of Justice, as specifically required by the terms of House Resolution 461 of the Eightieth Congress.

Testimony adduced before the subcommittee in the hearing has been printed separately and is available upon request.

Inquiry at the Department of Justice and a search of newspaper files up to the present time, has failed to reveal what, if any, action was taken as a result of the recommendations of the committee which called attention to the various Federal statutes which seemed to be involved in the political contribution solicitation which was the subject of the committee's investigation.

House Resolution 461 recited in part as follows:

The committee is authorized and directed to report promptly any and all violations of any Federal or State statutes in connection with the matters and things mentioned herein to the Attorney General of the United States in order that he may take such official action as may be proper.

Premier de Gasperi's Visit to the United States

EXTENSION OF REMARKS

OF

HON. PETER W. RODINO, JR.

OF NEW JERSEY

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. RODINO. Mr. Speaker, Premier de Gasperi has received a well-deserved welcome during his visit in the United States. The courage and steadfastness of this modest leader have kept Italy on even keel through 6 years of postwar turmoil and the constant effort of professional Communists to stir up trouble. His determination has led the Italian people through the difficult period of reconstruction. His devotion to democracy and freedom has inspired Italy to link its fortunes with those of the free world.

All who heard the sincere words of the Prime Minister as he addressed both Houses of Congress were impressed with the willingness of Italy to take a full part in the mutual defense of the North Atlantic area. In case of aggression, Mr. de Gasperi promised the Italian people would stand by and make their contributions to the common defense. Morally and materially, however, Italy is hampered in this respect by the Italian Peace Treaty.

This treaty was drawn up in times that have since entirely changed. It contains clauses which smack of rancor and a desire for vengeance—clauses which place severe restrictions on Italian sovereignty.

Especially since Japan has received a treaty called a peace of reconciliation, the Italian Peace Treaty is a source of bitterness among Italians. They feel their dignity as a free nation is impaired. Even more serious, however, is the fact that the treaty is out of keeping with the facts of international life today. Italy and the United States and the other free nations of the world are trying to cooperate in a supreme effort of collective security. But as Mr. de Gasperi said:

An effective and staunch alliance cannot exist without equality of rights and full recognition of the independence, sovereignty, and dignity of a nation.

As of today, the Italians have neither equality nor the dignity of full independence.

The present treaty limits the number of men and the amount of arms which Italy can muster to defend itself against Communist aggression. Italy may not have more than 300,000 men in military service. This is less than half the number which could be provided if the limitations were removed. England and France, with similar populations, already have armies more than twice that size. The Italian air force is allowed only 350 planes. The navy must be kept under 68,000 tons and can have no submarines. Unless these limitations are removed

Italy cannot do its proper share in the North Atlantic Treaty Organization. This is the opinion not only of the Italians themselves but of military technicians generally.

Italy's current difficulties are not solely those arising from an unjust and outdated treaty. Prime Minister de Gasperi in his speech to the Congress also alluded to the unemployment problem. There are 2,000,000 Italians currently out of work. That is an intolerable situation at a time when the need of the Western World is for production and more production. It is true that the European recovery program was successful in reducing unemployment by 500,000 from the high-water mark of two and a half million. Defense contracts can provide work for still more. But while 2,000,000 workers remain out of jobs the Communist threat in Italy will not slacken.

There is a way that we can help solve this dangerous problem with no additional expenditure but actually with profit to ourselves. The Prime Minister said Italy was looking for places abroad for some of its willing and industrious and able people. The United States could provide one outlet. The present quota of Italian immigration to this country is less than 6,000. That number can be increased. Not only is the United States capable of absorbing many more of these hard workers, but it will need them badly as the rearmament program swings into high gear. By liberalizing the immigration quota for Italy the United States will gain able hands to help increase its own strength and, at the same time, it will bolster the economic fabric of Italy and Western Europe.

The warm reception which Premier de Gasperi has received reflects the friendship between the United States and his country. Let us now act to cement this natural and historic relationship by carrying out quickly and completely the promised revision of the antiquated Italian peace treaty and by welcoming an increased number of Italian immigrants to these shores.

Under leave to extend my remarks in the RECORD, I wish to include herein an editorial which appeared in the Newark Star-Ledger commenting on De Gasperi's visit:

DE GASPERI'S VISIT

Italy is a poor nation, but it is also a strategic nation. It lies astride the Allied lifelines through the Mediterranean and its friendliness or animosity is of vital importance to the world conflict with communism. Italy can either be an asset or a liability in this conflict.

Italian Premier de Gasperi is now in Washington talking with key Government men over the role which his government can play in the vital battle ahead. De Gasperi is anxious for an important anti-Communist role, one that will involve the rewriting of the Italian peace treaty which placed undue emphasis on demilitarization and one that will give Italy more economic freedom.

It is well on the occasion of de Gasperi's visit to judge the needs of Italy against her

potentialities as an ally in the battle against communism. It would be absurd to place too much emphasis on Italy's potentialities.

Italy can make two important contributions and these are more dependent on herself than on the aid she receives from outside sources, particularly the United States.

First, Italy can make an enormous gift to allied defense in manpower provided that other nations are in a position to equip this manpower. This involves the rewriting of the Italian Peace Treaty.

Second, Italy's most important contribution can be in remaining non-Communist.

The second point is by far the more important from the standpoint of freedom's defense and it is significantly one which de Gasperi's regime alone can cope with irrespective of outside aid.

De Gasperi's government has pulled through victoriously twice after two tight squeezes at the polls. Most of the credit for these victories can be attributed to the help which anti-Communist countries, particularly the United States, gave to de Gasperi's party. But while some minor reforms have been made in Italy, the Communist cause still enjoys a gratuitous stimulus from the lack of basic land reforms from which the nation has traditionally suffered.

The United States wants to keep Italy on its side in the impending world struggle. It is willing to help Italy with her problems. But it is only reasonable to expect that in return Italy will aggressively pursue a program that will guarantee the freedoms that Italians dearly love and the security which Italy can provide the rest of the free world.

these agreements lost freedom for many nations, including Poland.

2. That the United States and its democratic allies be put into a state of military readiness with utmost speed, so that their combined forces shall be ready to meet the military might of Russia, which has been readied from the day of the termination of World War II.

3. That the greatest possible financial and military aid be given Spain, Italy, and Turkey, inasmuch as these nations hold key positions in the struggle with communism.

4. That the United States immediately withdraw its recognition of the present Polish Government in Poland, because it does not represent the Polish people, but is merely the obedient pawn of Stalin, yielding to his every wish and demand.

5. That the Polish nation be given the hope of freedom and, therefore, a greater will to resist, through the recognition by the United States of the Polish Government in Exile as the only true and legal government of Poland, which it already is, in fact, in the eyes of Polish people.

6. That the Katyn murders and their perpetrators be brought to full light and that the responsible criminals be made to answer for the greatest single crime in world history.

WALTER MAZNICK,
Chairman of Resolution Committee.
HARTFORD, CONN.

Operations of OPS

EXTENSION OF REMARKS OF

HON. WILLIAM H. HARRISON

OF WYOMING

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. HARRISON of Wyoming. Mr. Speaker, there is growing dissatisfaction—even outright resentment—with some portions at least of the operations of the Office of Price Stabilization, reflected in the mail received by many Members of Congress.

For example, I received only recently a letter from a banker at Lander, Wyo., enclosing five envelopes sent his bank by the Denver office of the OPS. Each of these envelopes was postmarked at 5:30 p. m. on September 21, 1951. Each envelope contained one copy of some change or regulation of the OPS, but each envelope bore a notation that 10 copies were enclosed.

I include as part of my remarks a portion of the Wyoming banker's letter:

The envelopes are enclosed for your inspection and that of your colleagues, to show reason why it is so necessary for the Congress to vote billions of dollars to run the business of the country, then taking it away from the taxpayer in such chunks as to have so little left that he can only provide for his family on a day-to-day basis, but not for any future adversity which, when it comes, under our present system, will be ruinous and chaotic to the people of our country, and it is very doubtful that our Government could again come to the aid of its people, except, perhaps, by utter confiscation and strict regimentation, because it seems to me at this time that our Government is rapidly approaching the stage of borrowing and taxing its people beyond a safe saturation point which, if not stopped, will result in a condi-

tion against which we are fighting all over the world.

From the enclosed, you can see why it is necessary to raise postage rates to private industry, also, why paper has jumped sky high, and why there is a shortage of help, as I presume five different clerks stuffed one sheet in each of the enclosed envelopes.

Furthermore, I wish you would endeavor to obtain the reason for the OPS sending regulations to us and undoubtedly the other more than 14,000 banks in the country, that do not pertain to our business in the slightest. I have them stacked a foot high already, on a counter in the bank readily accessible to our customers, and I have yet to find one customer sufficiently interested to pick one up and read it. Certainly they have a motive in sending the regulations to us, and perhaps it is that they think we bankers have nothing to do but to read them and after digesting their meaning, educate our customers. Well, to me it seems that the banks have already been burdened with enough free service to the Government, especially when we see the Government's waste and criminal extravagance.

Another thing, Mr. Harrison, they are continuously moving the cost of our postal service upward and the amount of service downward. In other words, it costs us more to get less service. This bank for years maintained a box in the post office here, and would get two drops of mail on Mondays through Saturdays and one drop on Sundays. About a year ago free delivery was started in the town, which undoubtedly increased the expense of the local post office, but I doubt very much if its receipts were increased thereby, consequently they must have a larger deficit than before they started free delivery, and they have it even though they have cut down on some of the service to boxholders, one of which comes to mind, that no mail is put in boxes on Sundays, and they say the reason for that is that they are not going to give the boxholders who pay rent any more service than those who get their mail delivered to them free. If that is not a case of the tail wagging the dog, what is it?

I am in complete sympathy with this Wyoming banker on both scores, Mr. Speaker.

Just why does the OPS persist in sending various regulations, changes in rules, and other material to the bank when such information has no connection whatever with the banking business? Probably the same sort of thing is true in other instances aside from banks. And if they insist that this stuff must go to the bank in question, just why could it not all be included in one piece of mail instead of five, all originating from the same office and posted at the same time?

As for his complaint about diminishing postal service at an increasing cost, this same lament could be echoed by many thousands of individuals and businesses the country over.

I believe it is imperative, Mr. Speaker, that this Congress give serious consideration—and now, without further delay—to the proposition that the Post Office Department needs overhauling, by congressional action if there are no other means by which such overhauling can be instituted. It has been pointed out that great savings could be realized by modernizing and streamlining the Department's administrative methods on all levels. An anticipated deficit of more than \$500,000,000 this fiscal year makes this an imperative matter. This habitual deficit is on the increase and must be

Polish Resolution

EXTENSION OF REMARKS OF

HON. ALBERT P. MORANO

OF CONNECTICUT

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. MORANO. Mr. Speaker, under leave to extend my remarks in the RECORD, I wish to include a resolution recently adopted by the Polish Army Veterans Association of America, District IV, of Connecticut:

POLISH ARMY VETERANS ASSOCIATION OF AMERICA, DISTRICT IV, OF CONNECTICUT

The Polish Army veterans and its auxiliaries for the department of Connecticut, in convention assembled in Derby, Conn., on the 15th and 16th of September 1951, deeply disappointed that the allied victories in World War I and II, toward which Polish Army veterans and their auxiliaries gave so much, have been dissipated through the shortsightedness of the leaders of the democratic nations, and regretting in particular, as Americans of Polish origin, that the country of their forefathers, Poland, was tragically sacrificed on the international political arena to gratify the greatest enemy of democracy, Soviet Russia, and regretting the tragic retreat before Russians at Yalta and Tehran, which have today brought worldwide chaos and the uncertainty of survival before the onslaught of Russian imperialism, diabolically concealed beneath the mantle of international communism, and being cognizant that these errors and their tragic consequences have brought the world to the brink of disaster and being cognizant that action is imperative have, therefore, resolved, as follows:

1. That the United States reject as invalid the agreements at Yalta and Tehran, since

stopped. In 1947, the total deficit was \$263,000,000 or 20 percent of the revenues; in 1948, the total deficit was \$310,000,000 or 22 percent of the revenues. The anticipated deficit of more than \$500,000,000 this fiscal year probably will not be the end of the trail unless we take action.

I know that the House and Senate have passed bills to boost postal rates, and the conference committee probably will split the difference between the two measures. The same thing is true of bills increasing the pay of postal workers.

I voted for both bills in the House, Mr. Speaker. I believe that increased postal rates would help offset the deficit, but I realize also that the increased pay for the postal workers will more than cancel out increased revenue from the higher rates.

If this seems a contradictory position, let me add this: I believe that many times the amount represented by the pay increase to postal employees could be saved by streamlining Post Office Department operations, from the top level down to the smallest country post office in the land. To effect such changes, the services of long-time, experienced employees will be needed, but the postal service is losing these valued employees at an increasing rate because of the differential between postal service salaries and those paid by private industry.

I want to see the United States postal service improved, not merely restored to its former high degree of efficiency. But to attain that goal, we need to modernize the system, throw out the outmoded methods of operation and unnecessarily complex and duplicating administrative details. Present-day methods of business management, budgeting, accounting, and auditing should be applied to the Post Office Department to assist in this effort for modernization, efficiency, and economy.

Veterans' Automobile Bill

EXTENSION OF REMARKS OF

HON. EDITH NOURSE ROGERS

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mrs. ROGERS of Massachusetts. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following letter:

VETERANS OF FOREIGN WARS,
OF THE UNITED STATES,
Kansas City Mo., September 24, 1951.

Re S 1864

Hon EDITH NOURSE ROGERS,
House Office Building,

Washington, D. C.

DEAR Mrs ROGERS: In view of your appointment as a conferee to consider the House-approved and Senate-approved versions of S. 1864, the veterans' automobile bill, I take this opportunity to advise you that the Fifty Second National Encampment of the Veterans of Foreign Wars of the United States,

held in New York City, August 26-31, 1951, endorsed the provisions of the House-approved version.

It is hoped the conferees will agree to the House version and report it favorably at the earliest practicable date. All that you may do in that direction will be appreciated.

With kind personal regards, I remain,
Respectfully yours,

OMAR B. KETCHUM,
Director.

Italy's Hour of Need

EXTENSION OF REMARKS

OF

HON. WILLIAM A. BARRETT

OF PENNSYLVANIA

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. BARRETT. Mr. Speaker, under leave to extend my remarks in the RECORD, I would like to express the great joy of my thousands of constituents of Italian descent with the splendid ovation given Premier Alcide de Gasperi, of Italy, by the Congress and other United States Government officials. Just as the entirely unofficial and practically spontaneous tide of letters from private American citizens to their relatives and friends in Italy succeeded in urging the latter to vote in favor of democracy during the Italian elections in 1948, the people of Italy today are hoping and praying that their pleas to the United States voiced by their Premier will receive a similar response from all Americans. Through the counsel and leadership of Premier de Gasperi, Italy has been transformed from a postwar state of chaos, riots, and inflation to a nation of toilers who have gone a long way toward reconstruction and social justice. Public order has been restored and the level of purchasing power strenuously defended.

However, the economic deprivations experienced by Italy after World War II have caused considerable hardship for both the industrial and agricultural populace. As a consistent proponent of cooperation with the western democracies against the Soviet Union and international communism, Premier de Gasperi can maintain the leadership of his people only if he can avoid starvation and discontent, as these conditions would make them easy prey for the Communist propagandists. He has the arduous task of decreasing the masses of unemployed in his small, overpopulated country. Italy's poverty in raw materials is more than leveled by her rich resource in the ability and willingness of its industrious people to work.

The idleness of the more than 2,000,000 people could be overcome by granting defense contracts to Italian factories and by giving Italy a fair share of the American defense dollars which are going to foreign nations. By revising the peace treaty to permit Italy greater rearmaments, she could utilize the material assistance granted by the United States to aid in her industrial development and

to build a stronger barrier against any future threats of aggression as well as to avert further economic strife. We all know the industriousness of the Italian people and their country's readiness and determination to cooperate in the foundation of a more just and humane world. Italy committed herself unreservedly to the cause of the western democracies led by the United States when she became one of the original signatories of the North Atlantic Treaty Organization in April 1949. She is now a military ally of the United States and has promised to contribute forces to the command of General Eisenhower.

I believe that it is therefore our obligation to readily respond to the plea of the Italian premier for the type of assistance which will enable his country to manufacture arms for the defense of Europe and maintain the economic stability essential to the independence, sovereignty and dignity of a nation. By contributing arms and manpower for the defense of Europe, Italy will be aiding us by alleviating the demands on our industrial resources and relieving many of our military personnel for assignment elsewhere or return to civilian life. What Premier de Gasperi has asked the Congress in effect is that we give his country the authority—through revision of the peace treaty—and a helping hand—through material assistance—to carry her own share of the burden of defending herself and other Western European nations.

There is another inconsistency in the terms of the Italian Peace Treaty which should be rectified without further delay. The vexing question of control of Trieste should be solved and an end put to the interim military occupation of the territory. This is a burning issue with the people of Italy and we cannot expect to maintain their respect if we do not uphold the declaration of the Americans, British, and French before the elections of 1948 that Trieste would be returned to Italy. Such action would not only be an important factor in Italy's defense, but would also consolidate the western coalition and hasten the day when Europe could defend her peace and freedom by herself. I hope that the State Department will endeavor to arrange negotiations between Italy and Yugoslavia on this important matter and that a settlement will be reached which would solidly establish the bulwark of European unity behind this common alignment of forces. The uniting of Europe would relieve the United States of its sacrifices in men and arms.

Another of Italy's principal problems is her overpopulation. Even with increased production she would have a high percentage of unemployment, because it is impossible to provide sufficient opportunities in this small, densely populated country. We could easily assist in this matter by permitting the issuance of immigration visas to Italian nationals in a number corresponding to the portion of the Italian quota which was not utilized during the 6 war years. During the period June 30, 1939, to July

1, 1946, there were 36,709 unused Italian quota numbers which were authorized by existing immigration laws. Priority could be given to workers whose skills are needed in the United States and in fields which are not overcrowded, such as masonry, tailoring, et cetera. In my congressional district alone there are thousands of American citizens of Italian descent who would welcome the arrival of their relatives and assist in having them find gainful employment. It was the intention of our immigration laws to permit a certain number of Italian nationals to enter the United States and I believe that we could help avoid an economic crisis in Italy by utilizing this unused portion of the Italian quota.

The United States has championed Italy's offers of cooperation with the western democracies and we cannot disappoint Premier de Gasperi and the Italian people in their present appeal to us.

William N. Oatis

EXTENSION OF REMARKS

OF

HON. HAROLD C. OSTERTAG

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. OSTERTAG. Mr. Speaker, under leave to extend my remarks, I wish to insert in the RECORD the following resolution adopted by Aerie No. 2424, of the Fraternal Order of Eagles, of Medina, N. Y., urging the Federal Government to be unceasing in its efforts to secure the freedom of William N. Oatis:

Whereas William N. Oatis, Associated Press bureau chief in Prague, Czechoslovakia, a free newspaperman who was performing his duties according to the standards and criteria of the free press of the world, was brutally snatched and imprisoned by the Communist government of Czechoslovakia without explanation, and

Whereas Mr. Oatis was arrested and held in detention without access to friend, Embassy representative, or trusted legal counsel; and

Whereas he was brought to trial and accused of insisting on obtaining accurate, correct, and verified information, which is the definition of the work of a free press, and

Whereas he was forced into admission of espionage because of his reporter's instinct for presenting the factual rather than the fictional; and

Whereas he was convicted and sentenced to 10 years of imprisonment by a trial which was universally condemned by all free nations as an outrageous kangaroo court, completely bereft of the principles of justice and the dignity of the human being; and

Whereas by its action, the Communist-dominated Czech Government showed its scorn for the principle of freedom of information and its hatred for our free world; and

Whereas representatives of the Soviet news agency, Tass, have the free run of the United States of America, and are permitted to attend press conferences at our National seat of Government, at which often much off-the-record information is discussed. Now, therefore, be it

Resolved, That Medina, N. Y., Aerie No. 2424, of the Fraternal Order of Eagles, urges the Federal Government and its agencies to be unceasing in its efforts to secure the freedom of Mr. Oatis by honorable means, and we also offer our support and the vitality of our membership to the executives of the Associated Press in their campaign to secure the release of Mr. Oatis by the communication of the true facts of the case to the free peoples of the world, and be it further

Resolved, That Aerie No. 2424, of the Fraternal Order of Eagles, urges the Federal Government to bar the correspondents from the Soviet news agency, Tass, as well as all satellite nation correspondents from official Government press conferences where vital information may be revealed until the release of Mr. Oatis has been secured.

Adopted this 20th day of September 1951, Aerie No. 2424, city of Medina, State of New York.

Attest:

LEO J. SHEPARD,

Worthy President,

CHARLES O. ALBONE, Sr.,

Secretary.

The International Labor Organization

EXTENSION OF REMARKS

OF

HON. MATTHEW M. NEELY

OF WEST VIRGINIA

IN THE SENATE OF THE UNITED STATES

Thursday, September 27, 1951

Mr. NEELY. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD an address on the subject of the International Labor Organization, delivered by George Delaney, international representative of the American Federation of Labor, at the A F of L convention in San Francisco, Calif., on September 19, 1951.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

At previous conventions, my predecessors and I have discussed the various conventions and recommendations adopted by the International Labor Organization as well as its other activities during the preceding year. However, there is another question concerning the ILO which seems to me to merit your particular attention now, and to warrant a temporary departure from this practice of the past.

You will find a discussion of the current and recent operations of the ILO in the report of the executive council to this convention. Rather than try your patience and attention with a repetition of this material, I will confine myself here to a subject which stands sorely in need of a thorough ventilation—a subject which bears serious implications for the future work of the ILO, and for the prestige of the United States in the eyes of the free world.

That subject concerns the attitudes and the tactics lately displayed by United States employer representatives in their operations both within and outside of the International Labor Organization.

During the past 2 years or so, these operations have shown all the earmarks of a studied, deliberate campaign to discredit the ILO, and thereby to undermine one of the most vital phases of American foreign policy in this period of world crisis—the strengthening of democracy throughout the

world through the promotion of the living standards, the rights, and the freedoms of the many, rather than the few.

Let it be noted that this campaign has not been carried out in any honest, open, and above-board manner. They have not ventured a frank challenge of that policy which United States participation in the ILO seeks to promote, nor have they advocated an outright end to that participation. They continue to profess their sympathy with the aims of the ILO and their belief in continued United States participation in the organization. But their actions and their methods contradict all of their pious professions of intent.

The recent record would seem to indicate that the purpose of the employer participation is not to promote the aims of the ILO, but to prevent their accomplishment.

Their design for the ILO is that of an empty institution, rather than an effective instrument of progress. They favor the form, but they oppose the substance. They will support the ILO, so long as it accomplishes nothing of consequence. They will adhere to its principles, so long as no effort is made to put those principles into practice.

Their efforts to neutralize the ILO as an effective ally of economic and social advancement have lately been reinforced by an insidious propaganda campaign within this country. The methods employed in this campaign are not new to any of us here. They belong to a pattern which we have seen employed against every progressive measure which we have ever sought to advance. They are in the old familiar style of reaction, tried and tested in many a famous battle against the cause of human welfare—unvarying and only too often victorious.

In their programs of resistance to every enlightened effort to promote the wider adoption of twentieth-century standards, there is no room for serious, responsible arguments on the merits of the specific issues involved. They proceed by indirection, employing all the techniques of misrepresentation and deception—peddling confusion and groundless fear—exploiting the gullibility of the public, with a vicious disregard for truth or simple honesty.

They have made flagrant use of all of the old goblins, ghosts, and phony phantoms which generations of wild-eyed conservatives have conjured up to frighten the people out of their rights and hopes for the future.

All of the agencies in the interlocking directorate of reaction in this country—die-hard private groups, the extremist press, and moss-backed Congressmen—have been pressed into service in the effort to build a lasting road block in the path of progress. Let me give you one good example of their technique of chain reaction.

Both in this country and at the meetings of the ILO, the employer delegation has persistently raised the bug-a-boo of the possibility of ILO conventions being used under the treaty power of the Federal Government as a means of bypassing Congress and invading the rights of the various States. On July 15 of this year, the Cincinnati Enquirer ran a newspaper story based on an interview with Mr. William McGrath, president of the Williamson Heater Co. of Cincinnati, who has been an employer representative at the last three ILO conferences. It might be noted in passing that Mr. McGrath is not one of those employers who stoops to such indignities as bargaining collectively with his employees—his firm is strictly nonunion.

On July 20 the Senator from Ohio [Mr. BRICKER] inserted this newspaper story in the CONGRESSIONAL RECORD. The Washington Times-Herald then promptly chimed in—chanting “me-too” on the points made by Mr. McGrath. McGrath's statement is so

typical of the fictitious propaganda used by the employer group that I feel impelled to deal with it at some length.

In this story McGrath—described as “a sober Cincinnati businessman”—is reported to have stated that—

“Americans have found a new way to hand over their freedom—without firing a shot and with the United States Constitution nodding approval. . . .

“Uncle Sam has found a new way of cutting his own throat . . . we can—and do—legislate ourselves into collectivism by international treaty. For treaties . . . are now being cooked up to control our everyday lives and make a joke of the Declaration of Independence.”

McGrath offers three points in support of his little horror story. First, he says that “America is the only country in the world which unreservedly makes any treaty supreme to any law of the land . . . even municipal ordinances.”

Presumably, he regards article VI of the Constitution as a shocking piece of socialism, designed to strip us of our liberties.

Second, he states that—and I quote from the article, “Treaties are now being dreamed up by international dreamers which would regiment us if we sign them. . . . And only half of our Government—the Senate—votes on a treaty.”

For his third point, McGrath practically backs up and shouts “Boo!” Here is what the article says: “Any time America sits down in international conferences . . . our negotiators are a free enterprise island in a sea of socialistic planning. Even well-meaning treaties come out of such sessions in a form likely to upset our constitutional liberties.”

Of course, McGrath does not undertake to quarrel with the purpose of the ILO—which he describes as “laudable.” He only implies that it would be very dangerous if we tried to do anything that might tend to fulfill that purpose.

Here is his version of what goes on at the ILO:

“The ILO . . . passes resolutions, recommendations, and conventions. The first two are nice friendly suggestions that every country ought to turn into law. Conventions are actual draft of laws, and each country is supposed to submit the convention for ratification to its own lawmakers. For the United States such ratification, by the Senate alone, automatically creates supreme law.”

Then he tries to show what horrible things can happen under this system. He says that, and again I quote.

“Some of the proposals being pushed at ILO include ideas like Nation-wide collective bargaining (which would mean actual communism, with a small “c”), abolishment of all private employment agencies, and legalization of the closed shop. In the latter case a treaty to this effect could, theoretically, slip through the Senate alone and create law that Congress as a whole has rejected.”

McGrath's article is correct in stating that the ILO passes resolutions, recommendations, and conventions. It is also correct in stating that conventions are draft treaties which may be ratified. But that is about where it begins to part company with the truth. The rest is pure fancy.

This whole argument that the Federal Government is going to be able to do by treaty what it cannot do by legislation is nonsense. It is based on the ridiculous premise that the President can persuade two-thirds of the Senate to do something by treaty which a simple majority of the two Houses of Congress would not approve as legislation. Furthermore, it completely overlooks the fact that subsequent legislation could override any treaty, and that Congress can at any time reverse by legis-

lation any action which has been taken by treaty.

Let's take a look at these conventions which McGrath says are going to nullify the Declaration of Independence, and regiment, socialize, and communize this country. There are nine ILO conventions now pending before the Senate, and recommended for ratification. Of those six deal with maritime matters where there is no question of the power of the Federal Government to legislate. The other three are No. 63, dealing with labor statistics, No. 88, dealing with the Public Employment Service; and No. 87, the Convention on Freedom of Association and Protection of the Right to Organize. None of these would require additional Federal legislation because the United States is already in compliance with them—or would their ratification repeal any existing legislation.

Going back to the newspaper story, McGrath refers to an alleged ILO proposal to bring about Nation-wide collective bargaining, as an idea being pushed by “international dreamers.” This is no dream of internationalists—it is the nightmare of an isolationist named McGrath.

I have no idea where he got the idea for this particular bit of fiction—possibly from the recommendation on collective agreements adopted at this year's conference, although there is no mention in the recommendation of Nation-wide collective bargaining. If so, it should be made clear that the conference adopted a recommendation, described in the same newspaper story as a “nice friendly suggestion,” not a convention, which is a draft treaty.

His story next mentions an alleged proposal by the ILO to abolish all private employment agencies. He probably means convention No. 96, which has not yet been transmitted to Congress by the President. This convention provides for two methods of dealing with private employment agencies: one, their progressive abolition; or, as an alternative, their regulation. The country ratifying the convention may choose either method it desires.

The significant thing about this is that the United States employers voted for that convention at the 1949 conference. Mr. McGrath has now reversed his position and points to the convention as an example of communism in the ILO. That is very peculiar, considering who voted against the convention. There were 19 opposing votes. They were cast by the full delegations of Bulgaria, Czechoslovakia, Hungary, and Poland, one government delegate from Haiti, and one from Mexico, and the government worker delegates of Argentina (the Argentine employer voted in favor.)

Finally, the news story refers to legalization by treaty of the closed shop. This is as phony as it is ridiculous. There are only two conventions which might conceivably be involved, No. 87 and No. 98, convention No. 87 on freedom of association, adopted in 1948, has nothing whatsoever to do with union security. Nor does convention No. 98, on the principles of the right to organize and bargain collectively, cover union security one way or the other. After a long argument at the 1949 conference during which the employers attempted to get antiunion security provisions in convention 98, the following report was adopted:

“The convention finally agreed to express in their report their view that the convention could in no way be interpreted as authorizing or prohibiting union security arrangements, such questions being matters for regulation in accordance with national practice.”

Furthermore, convention 98 was not even submitted to the Senate for ratification. It was considered as appropriate in part for action by the several States and, therefore, not appropriate for ratification. It was

transmitted by the President to the Senate and House of Representatives without any specific recommendation. It was also transmitted by the Secretary of Labor to the governors of the 48 States.

Employers have argued for some time that the ILO was adopting too many conventions on too many subjects. At this year's conference a preliminary discussion was held on a proposed convention covering the minimum objectives of social security. This was intended as one comprehensive convention covering various fields of social security. The position of the United States employers on this was rather strange considering their argument that the ILO is adopting too many conventions. They supported a move to have nine separate conventions instead of one.

American employers are very fond of drawing comparisons favorable to themselves, showing how much more enlightened and progressive they are than their counterparts in other countries. I am sure that, generally speaking, they are right about that. However, I am equally sure that it cannot be proved by the nature of United States employer representation in the ILO. Far from showing themselves to be more enlightened than employer delegations from other countries, they have continually resisted the adoption of sound and progressive measures by the ILO.

On the one hand they scream that ILO conventions will interfere with the internal affairs of this country. Then, untroubled by petty considerations of consistency, they turn about and try to use the ILO to export their own peculiar international dream of a compulsory open shop to an unwilling world.

It should be noted that the NAM and the chamber of commerce appear to be following a policy of including as many nonunion employers as possible in their delegations to the ILO. Our representatives, and those of other countries that have long since recognized the economic necessity of collective bargaining, are compelled to sit and listen to their expressions of tender regard for the worker's treasured right not to be represented by a union.

They have not as yet carried this line of reasoning to its logical conclusion by promoting conventions which would guarantee such allied freedoms as the worker's inherent right not to have anything to eat, his right not to have a place to live, his right not to get a decent wage, and all of those other sacred rights which the ILO has heretofore neglected to promote—but at their present rate, they will get around to that eventually.

This summer, a convention and a recommendation concerning equal pay were adopted by the conference. Now the principle of equal pay is not generally considered to be a revolutionary one in this country, and it is a pretty sad thing if all the representatives in the United States, the cradle of democracy, cannot support it. What happened? United States employers supported the principle in their speeches—but they voted against it. They objected because it was in the form of a convention. But did they support the recommendation on equal pay that was also up for adoption? No; they abstained.

It frequently appears as though the United States employer representatives go out of their way to antagonize representatives from other countries in the ILO, and to sabotage the goodwill which the United States is seeking to promote by its association in free discussion with Government, worker, and employer representatives from the free nations of the world. For example, one of the employers' representatives made a speech at this year's conference discussing proposed conventions dealing with minimum wages and holidays with pay for agricultural workers. Considering where this speech was

made it was a classic example of how not to win friends and influence people. A couple of quotes from statements of representatives from other countries in response to this speech will give you some idea of the general reaction.

A worker's representative from Brazil said: "As the worker's delegate of a new country which is doing its best to set an example to others, I say that we cannot agree with the statements made here by the United States employers' delegate, who is not in any respect representative of the democratic people of our sister nation. His remarks are beyond doubt inspired by the same state of mind which has been manifested in other statements which endeavored to deny all the rights of the workers.

"It is not by such an attitude that we shall uphold the principles of social justice.

"I was very much struck by the remarks made by the United States employers' delegate. I was also very much disappointed. I was disappointed because the United States is the standard-bearer of democracy and of social justice."

The Government delegate from Mexico said:

"I wish to say to the United States employers' delegate that we do not want his advice. We have not asked for it because our agricultural reform is evolving without foreign interference."

Workers' representatives in the ILO have always tried to cooperate with both the Government and employer delegates as much as we can without compromising our principles. In this critical period we have considered it desirable to present a united front to the rest of the world and to keep external signs of friction to a minimum. There is no inherent reason why this should not be possible. Surely the economic interests of American employers lie in the direction of improved labor standards in backward areas of the world. They stand to lose as much as we do when workers are paid starvation wages, worked long hours, and otherwise exploited in other countries—for it means that they are faced with the competition of foreign employers who can undercut them in the market places of the world because of this advantage of cheap labor. And surely American employers have as much to lose by the spread of communism among the underprivileged masses of the world.

At such a time as this, when the world trembles under the heavy tread of communism on the march, can they think of no more important a contribution to the cause of democracy than silly double talk about the workers' inherent right not to exercise his right of association? Can they seriously believe that by frustrating the work of the ILO they can strike a blow for free enterprise? Communism advances through the gaps left by the failure of free societies to live up to their social and economic responsibilities. The irresponsibility lately displayed by employer representatives to the ILO must be counted as an asset to the side of those who seek to overthrow freedom where it still lives today.

In more normal times perhaps we could laugh this off as just another phase of the old pattern of NAM and chamber of commerce tactics and policies as we have known them for decades past. But today, every such demonstration no matter how far removed from the actualities of American economic life, is seized upon by the enemies of freedom, and used as a weapon against us. The words and acts of those who—no matter how falsely—purport to represent the views and interests of American employers as a whole in these conclaves of world opinion have delivered such weapons into the hands of the agents and missionaries of world communism.

I am under no illusion that anything which we might say or do here can persuade the NAM and the chamber of commerce to abandon the course of reaction in world affairs. Nor do I consider it desirable for responsible groups in American society to air their internal differences before the gaze of a confused and troubled world.

But to remain silent would be to allow a vocal minority in this country to do a more thorough job of misrepresenting the United States in the eyes of the world than the Communists could ever hope to do. We cannot permit their tactics and methods—reflecting as they do upon the motives and purposes of this country in its foreign and domestic policies—to pass without repudiation.

It is important that we should recognize these employer tactics for what they are. If the ILO is not to become a travesty on its original design, they must not be permitted to go unchallenged. On this depends the larger question of whether the ILO is to become a powerful instrument of progress under freedom, or a mere impotent, empty shell.

If the aims of an enlightened American foreign policy are to be realized, and if our ideals of freedom, democracy, and social justice are to ultimately prevail throughout the world, the International Labor Organization must continue to receive the full support of the people of the United States.

Our Second Line of Defense

EXTENSION OF REMARKS OF

HON. CLINTON D. MCKINNON

OF CALIFORNIA

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. MCKINNON. Mr. Speaker, the Pacific coast tuna industry does an annual business of more than \$100,000,000 and employs more than 23,000 people. Frozen tuna imports are rocketing to an all-time high, dealing a knockout blow to a fleet of tuna clippers that may well be called our second line of defense in the Pacific. The following story of their conversion to war service in the early days of World War II was recently broadcast over radio station KSDO in San Diego, by Mr. D. W. Wells, a San Diego tuna fisherman, who is one of the unsung heroes in the battle of the Pacific:

One factor which I believe has been grossly overlooked in this matter is that of national defense. One might inquire—what has the production of tuna to do with national defense other than the fact that tuna is a highly nutritive food product? Let's review some very recent history.

On December 7, 1941, a large part of the San Diego tuna fleet was at sea engaged in fishing operations. Within a period of a few days, wheels were set in motion which, within a minimum period of time, gave the Panama Canal a protective floating picket line. This at a time when our seaward defenses of the canal were acknowledged to be highly inadequate. Almost overnight, tuna boats were converted to naval vessels and were pressed into service.

Many of the boats which were fishing in the vicinity of Panama at the time were ordered directly to Panama and were placed into service without even the formality of returning to their home port.

Shortly thereafter, the Navy saw fit to accept the offer of service which was tendered

by the owners and operators of the fleet, and we witnessed here in San Diego a remarkable transformation. The bulk of the boats in the tuna fleet suddenly changed color from white to gray, and pluids and gabardines were discarded by a large portion of the men of the fleet in favor of Navy blue. I was privileged to be among them and can attest to the fact that this all took place in a period of 5 days and on the sixth day these boats and their crews were bound for Panama to reinforce the defenses there.

Later these same vessels were pressed into service transporting foodstuffs in the South Pacific. What other vessels were more suited to the specialized job of carrying refrigerated cargoes than these? I think it should be noted as a matter of record that the Navy thought so highly of these tuna boats that it saw fit to construct 26 additional boats which were carbon copies of the tuna clippers. Since V-J day these vessels, known as YP's, have been purchased from the Navy for use as fishing boats here.

Today some 20 of the YP's, plus 150 other large clippers, lie idle at their piers unable to compete with foreign competition. Within a few months, if corrective measures are not taken, the present critical condition will evolve into a state of economic chaos and not too long after that will be well along toward a condition of complete collapse.

Should these events take place, as they certainly threaten to now, the United States will lose a 3,000-mile cordon guarding the western approaches to this hemisphere. During normal periods of operation, the more than 200 large vessels of the tuna fleet, operating in offshore waters from San Diego to Peru, constitute a bulwark to our western frontiers which costs the Government and the taxpayer not one penny. The nature of the tuna fish is such that the heaviest concentration of vessels centers around one of our most valuable and vulnerable assets—the Panama Canal.

Are we to sit back idly and permit this highly effective, tax-free asset to our national defenses to be scuttled? Are we to sanction the elimination from our defense facilities a potential force of over 200 auxiliary naval vessels? I for one say "No" and trust that all those within the hearing of my voice will join me in communicating these facts to their Congressmen.

Maritime Administration Appropriation

EXTENSION OF REMARKS OF

HON. THOMAS J. LANE

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. LANE. Mr. Speaker, under leave to extend my remarks in the RECORD, I wish to include a letter I have received from Mr. S. P. Jason, one of the commissioners of the Massachusetts Maritime Academy, concerning monthly allowance formerly paid to cadet-midshipmen attending the State maritime academies:

FAIRHAVEN, MASS., September 20, 1951.
Hon. THOMAS J. LANE,
House Office Building,
Washington, D. C.

DEAR SIR: As a commissioner of the Massachusetts Maritime Academy I am calling your attention to the unfairness of the Independent Officers Appropriation Act, Public Law 137, passed by the Eighty-second Congress.

As you know this act contained the appropriation for the maintenance of the Massachusetts Maritime Academy and as it has been passed it has eliminated the monthly allowance formerly paid to cadet-midshipmen attending this school. Because I am acquainted with these pupils, I realize what the consequences of this will be. It will mean that boys from our families of limited means will be unable to complete their courses and will be deprived of the opportunity of becoming officers in the United States Merchant Marine, Coast Guard, and Naval Reserve. Many parents now find it necessary to borrow on their savings to get the \$600 for the entrance fee and without the monthly allowance they will find it financially impossible to keep their boys in the academy. We have created a stumbling block in the path of deserving boys of our Commonwealth and Nation and by so doing deprived our country of the services of these fine boys. Graduates of this academy have established an enviable record for distinguished service in maritime and naval history throughout the world. It is short-sighted economy to scuttle the opportunity of boys of moderate means at a time when technically trained manpower is playing so vital a part in our national defense and well-being.

Two weeks ago I had the privilege to attend the graduation of the class of 1951 in Faneuil Hall in Boston. Here from the stage of that fine, old, historic place I witnessed with pride this fine group of American youth take their oaths as licensed third-class mates in our merchant marine and as ensigns in the United States Merchant Marine, the United States Coast Guard, and the United States Naval Reserve. Here is a well-trained group who will be immediately available for active duty in the service of the country whenever the occasion arises. My pride was turned to chagrin however, when I saw the members of the lower classes and realized that most of these boys would be unable to finish their courses and graduate due to Public Law 137 which has deprived them of a monthly allowance so financially necessary to them.

In passing legislation of this type Congress has shown a lack of vision and deplorable business sense. We are pouring millions into the war in Korea, we are spending more millions to educate and train the people of Europe and Asia while we take from our youth this opportunity to train and serve. We subsidize the businessman, the farmer and the banker, but we refuse to underwrite the potential services of highly trained maritime manpower so necessary in keeping these same businessmen, farmers and bankers in operation. Without a large, strong merchant marine to carry on our commerce we would be a third-rate nation and in order to have such a merchant marine we must have finely trained officers to man it. To have our academies established so that they are only within the reach of sons of families of wealth is not in the American tradition.

The responsibility for developing and maintaining a well-trained merchant marine falls on the legislators of Massachusetts and other coastal States. We cannot expect legislators from inland States to be interested in building up this service. It is up to us on the coast to see that maritime schools are fostered and encouraged and I am calling upon you as an elected representative of the people of the Commonwealth of Massachusetts to start action at once and through the joint effort of all the Massachusetts Members of Congress correct this flagrant discrimination.

Respectfully,

S. P. JASON,
Commissioner,
Massachusetts Maritime Academy.

Hon. James T. Patterson's Plan for Safety on the Highways

EXTENSION OF REMARKS OF

HON. ALBERT P. MORANO

OF CONNECTICUT

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. MORANO. Mr. Speaker, on behalf of my colleague, the Honorable JAMES T. PATTERSON, of Connecticut, I wish to include in the Appendix of the Record the text of his remarks on the very important subject of highway safety. This well thought-out and constructive speech on a subject close to all of us is to be delivered today at the Elks-News Safety Council banquet in Naugatuck, Conn.:

PREVENTION OF MOTOR VEHICLE ACCIDENTS (By Hon. JAMES T. PATTERSON)

We are concerned here tonight with the alarming volume of avoidable traffic accidents and what we may be able to do to reduce it. Effective traffic safety activities are not only humanitarian and socially constructive, they are economically important and vital to the program of national defense.

Before I turn to the national aspects of the street and highway safety problem, I wish to pay brief but deserved praise to the many Connecticut officials in State and community departments of government who are constantly working to make our roads safer and to protect the lives of our citizens who use them. I'm referring to officials like Col. Ed Hickey who does such an outstanding job as State police commissioner, to Charles F. Kelley, commissioner of motor vehicles, to G. Albert Hill, State commissioner of highways, and, of course, to Ed Dooling, who sparks our local effort.

Also let me compliment the Connecticut Safety Commission—its chairman, Robert I. Catlin, and its director, William M. Greene. This highway safety coordinating agency, through its studies, reports, and cooperative efforts, has stimulated wide interest in traffic-accident prevention. It provides a State-wide program to do something about it. We're not meaning to rest on our laurels—quite the contrary. But it is a fact that, last year, Connecticut had the second best record in the Union in the rate of traffic deaths per 100,000 vehicle miles of travel. It was third best in the Nation in the rate of traffic deaths per 100,000 population. Naugatuck has earned national recognition for its accident-prevention program.

Naturally, we're glad that our situation is better than that in many places but, I'm sure you will agree, there's plenty of room for improvement. Our safety record can be a great deal better if we determine to make it so.

Nationally, the city and rural traffic problems are about the same as they are here and they have to be solved in about the same way.

The promotion of traffic-accident prevention may appear to lack some of the glamour that is often unwisely associated with campaigns against rare crimes and relatively minor disasters. But, from the standpoint of conserving life, limb, and property, it's the Nation's No. 1 job. Careless drivers and careless pedestrians have made the traffic accident our worst single death-dealing agent.

I wonder whether enough people across the Nation are conscience stricken, as they ought to be, with the brutal, appalling facts? These facts have to be driven home again and again until a motorist or pedestrian will suffer acute personal shame to be the guilty party to an avoidable traffic accident.

Who can help being dismayed at last year's reported total of over 8,000,000 motor-vehicle accidents? That means that, on an average, one out of every six motor vehicles in this country was involved in an accident of some kind last year. Ten percent of those accidents resulted in deaths and injuries. In all, 1,200,000 men, women and children were injured and 35,000 lost their lives. The economic loss was more than \$3,000,000,000. And the saddest part of it is, most of those accidents could have been prevented. Most of them never should have happened.

Think of it this way: One out of two persons now living in the United States has been or will be injured in a motor-vehicle accident before he dies—unless the present rate is greatly reduced.

Unfortunately, the rate is not declining. In fact, this year the trend is upward and it looks as though traffic accidents might kill 3,000 more than last year. The enormity of this carnage is not just depressing, it's alarming. Why, last year alone, the fatalities from motor-vehicle accidents exceeded by over 10,000 the total of Americans killed in action and who died from wounds in the Revolutionary War, the War of 1812, the Mexican War, the Spanish-American War, and so far in the Korean conflict. It's over two-thirds the number of similar deaths in World War I and more than half as many Americans as were killed in action or died from wounds on the average for each year in World War II.

The National Safety Council predicts that the millionth traffic death may occur before Christmas this year. That will be nearly twice the number of American deaths from action or wounds in all of our wars in all of our history.

We can't blink the truth that, collectively speaking, the traffic accident threatens to get completely out of hand and it may do just that if we don't marshal all of our corrective forces to control it.

There are a great many factors responsible for this outrage. Chief, of course, is the take-a-chance attitude of too many people. That becomes increasingly dangerous in vehicular congestion and right now we've got 50,000,000 motor vehicles piling up nearly one-half trillion vehicle-miles on our vast system of streets and highways. These astronomical figures are part of our Nation's pride. They reflect the mobility that is an essential of our way of life, a vital member of that ingenious trio—mass manufacture, transportation, and consumption—that forms the backbone of our economy.

Mussolini crowed that he was able to make the trains run on time. Here we take such punctuality for granted, just as we take for granted the efficiency of all of our methods of transportation. And, of all our mechanical means of transportation, the motor vehicle is the most common and indispensable. Once a luxury, now a necessity, by sheer force of numbers it is clogging our inadequate highway arteries and, in too many careless and irresponsible hands, creates grave traffic hazards.

To illustrate how rapidly and widely the motor vehicle has come into use, at the turn of the century, Michigan, world center of automotive manufacture, boasted of 360 cars on its roads. In 1950 there were over 2,400,000 motor vehicles and nearly 3,000,000 licensed drivers in that State. That's a good example of how spectacularly a great industry can develop in the free-enterprise climate of this country. Concurrently with the development grew a vast complexity of traffic problems. At first, motorists followed the rules of the road for horse-drawn vehicles. Then gradually some elementary motor traffic regulations were adopted with New England States taking the lead. By the end of World War I, it was evident that the

automobile was here to stay. Interstate highway transportation created a major problem. States set up barriers that actually prevented a vehicle of one State from entering another State unless certain requirements were met. Motor vehicle laws were a hodgepodge. The need for uniformity was asserting itself.

Tentative, helpful steps were taken in several directions in the early twenties. They were brought into line, for the first time, by the National Conference on Street and Highway Safety, called in Washington in 1924 by Herbert Hoover, then Secretary of Commerce. In this and subsequent conferences, progress was made in provision for a coordinated coast-to-coast program for traffic safety. Advance was made toward development of the Uniform Vehicle Code, the Model Traffic Ordinance for Cities, and the Manual on Uniform Traffic Control Devices.

These early efforts paved the way for the meeting of the first President's Highway Safety Conference, in Washington, in 1946, which produced a comprehensive national plan for across-the-board action to prevent traffic accidents. The Conference is non-partisan in make-up and includes the ablest national experts in every field of traffic safety. In the States where its Action Program has been effectively applied, and Connecticut is a good example, the traffic death rate per 100 million vehicle miles of travel has been forced down.

This is proof that the conference plan is sound. It recognizes that uniform, cooperative effort by the States and communities is the way to tackle the traffic problem. Generally speaking, it's not a matter for congressional action. It can't be solved by bureaucratic decree or executive fiat in Washington. It's definitely a job that has to be done back at the cross-roads.

But this doesn't imply that traffic safety is a simple challenge, easily met. It isn't. It's extremely involved and there's no panacea for it.

Take our highways for example. In this respect, we're not equipped to safely and efficiently handle the press of today's traffic. Our roads were inadequate for the purpose at the time of Pearl Harbor when we had only 34,000,000 vehicles in operation. Since then, they have been permitted to deteriorate still further. Now, superimposed on normal traffic, we are faced with the heavy demands of the military and of defense cargoes which must be expeditiously moved. The Bureau of Public Roads has reported serious deficiencies in our military strategic highway network which is roughly the national system of interstate highways, plus some added mileage. The Bureau says, and these are approximate figures, that more than 93 percent of the roads in the system are inadequate for even peacetime needs. Of the 40,000 miles involved, 24,000 rural miles have surfaces too narrow for passenger cars and trucks to pass with safety. Over 7,000 miles have sight distances so short that passing is dangerous; over 650 grades are so steep as to seriously reduce the speed of truck movement. Further, and of grave concern to authorities charged with the movement of military vehicles, is the fact that over 7,500 bridges are too weak for some of the loads known to be moving over the system now.

This means that a vigorous program of highway construction and maintenance is important to traffic safety. Of course this cannot be a continuing accomplishment without the regular provision of adequate funds. At the moment, the outlook is darkened by an increasing pinch on basic materials. We know, for instance, that steel allotments for road construction have been cut in succeeding quarters and that deliveries from the mills are badly delayed. This is causing a lot of worry in Washington and

out in the States where highway department officials are wondering what is going to happen if they can't do the job that needs to be done. A drastic curtailment of reconstruction and maintenance could only mean a still further breakdown of our already over-taxed highway plant. That, of course, would be a blow to the defense program and to essential civilian activities, so dependent upon motor transportation. It would cripple highway safety progress by increasing the already incalculable number of chances for accidents.

With respect to the national defense, it seems to me it is imperative that we step up all traffic safety activities to conserve manpower, equipment, materials, and highway facilities. Further, it is necessary that harmonious arrangements, compatible with the States' motor-vehicle laws and with the condition of our highways, be made to insure the safe and efficient movement of increasing amounts of defense material and military traffic. It's gratifying to know that the Department of Defense has already worked out a cooperative arrangement with the States governing applications for permits for oversize, overweight, and other unusual movements of particular concern to the Army, Navy, and Air Force. I understand that this is a better procedure than was in effect in World War II and that the States find it works more effectively.

In the civilian-defense field, traffic safety and efficiency are exceptionally important. The Federal Civil Defense Administration has selected the Traffic Institute of Northwestern University to develop traffic-training programs that will result in help to communities, in the event of enemy attack, to continue their transportation systems and to have their commerce and industries function as normally as possible. Experiences abroad in the last war and now in Korea have shown how essential military and civilian street and highway movements can be blocked by unregulated foot and vehicular traffic. Priorities must be provided for emergency movements of vehicles for fire fighting, rescue, first aid, demolition, and other urgent activities requiring specially trained personnel. I am informed that plans for traffic training and policies to govern in transportation emergencies are now advanced. We pray they may never have to be employed but if they are, their ultimate effectiveness will depend, of course, upon how seriously they have been accepted and applied by the people in our cities and local communities. The burden of direction rests on our State and local civil-defense officials and its corps of trained volunteers. If an attack ever comes, the final test will be in the measure of our calm, common-sense compliance with their commands.

Another helpful step in civilian protection has been the Civil Defense Agreement between the United States and Canada. This provides that if there is an attack, civil defense activities, including those affecting highway facilities and equipment, of the two countries shall be coordinated for the protection of persons and property. The agreement specifies that this defense coordination shall apply as if there were no border. That, as well in keeping with the traditional friendship of these two great neighboring countries.

Thus we see that there is wide emphasis on the essentiality of highway transportation. It is to our national advantage to expand and strengthen it. It is urgent that we make our highways safer.

Colonel Hickey knows as well as any man that traffic accident prevention springs from sound education, engineering, and enforcement—and, in his case, enforcement with a capital "E." An impressive commentary on one phase of this work was made to the President's Highway Safety Conference last June by Police Chief John M. Gleason, of Greenwich. Chief Gleason, as you may know,

is immediate past president of the International Association of Chiefs of Police and is currently on a mission to Germany for our Government. Here's what he said:

"It is all well and good to be engaged in safety work where most of it is done on paper or from the platform, but any person who has gone out on the highways and by-ways at all hours of the day and night and lifted people out of cars in pieces, literally, and has worked in blood up to his elbows and held men, women and children on emergency tables while they were sewed up, and without injections, does not need any selling on safety. * * * You get it from the grass roots. You do not learn it from a book. You see the results of drunken driving and carelessness * * * first-hand * * * Then you go to a home and tell a mother that her son has been suddenly killed. * * * That is regular police duty."

This is indeed the picture that our police officers are seeing over and over and over on our highways. It's what makes traffic safety one of the most positive challenges to public action in the United States. And don't get the idea that it's primarily a big city problem. As a matter of fact, it's more of a rural problem, although, of course, many city drivers are involved in rural road accidents. Statistically, last year, there were 10,200 people killed in town and city traffic accidents as compared with 24,800 in rural traffic accidents. As might be expected, pedestrian deaths were greater in the congested centers, with 5,500 killed in the towns and cities as against 3,200 in the farm areas. There's no reason to believe that careless driving in the city is rarer than it is in the country but the wide open spaces seem to inspire a type of speeding and recklessness that ends in more fatalities and serious injuries.

My point is that no community or county in the Nation is exempt from the traffic-accident problem. It is with us wherever we have a street or a public road. This means that there's a powerful need everywhere for community groups, like your safety council, to organize in support of really effective traffic safety programs.

I thought this was well underscored by the Chamber of Commerce of the United States in its recent policy on traffic safety. Here's what this national organization, comprising about 2,700 local chambers of commerce and an underlying membership of over a million and a quarter businessmen had to say:

"The elements of a traffic-safety program of communities and States should be those recently developed and approved by the President's Highway Safety Conference. Businessmen and their organizations should give sustained support to the street and highway traffic safety program."

The significance of this policy is in its premise that businessmen should lead sustained support to a balanced program.

This is the concept that I think should be emphasized when we survey ways and means to prevent traffic accidents. National standards, such as the Uniform Vehicle Code and others, are extremely helpful as guides to common action but the real responsibility is focused squarely on State and local administrative departments and legislative bodies. It is necessary that they work together with a carefully coordinated plan of action. The highway designers, the traffic engineers, the police, the motor vehicle and driver licensing officials, the courts and the schools all have urgent responsibilities in executing the laws and ordinances adopted by the State, city, and county legislatures.

We know it's impossible to combine all of these agencies of Government into a single department. We wouldn't want to if we could. Therefore, there's a definite requirement for a coordinating body such as the Connecticut Safety Commission that has the support of the Governor and mayors and

includes a number of policy-making members with intimate knowledge of the traffic safety problem. Such an organization is needed to develop a cooperative program for concerted and continuing action by official departments and agencies. It spearheads the whole, united effort and it must be backed up by organized public support. A group such as yours is an integral part of organized action in support of an official, coordinated program. By taking a more and more active part in a sustained program to cut down traffic accidents, you will make a valuable contribution to the welfare of your community, your State, and the Nation.

Without going into detail I would like to observe, in passing, that there are official State highway safety coordinating committees, commissions, or agencies now operating in 40 States. Efforts are under way to establish them in the remaining States. Nationally, the State and Local Officials' National Highway Safety Committee acts as a coordinating body to help bring about joint planning by, and closer cooperation between, State and community officials concerned with traffic problems. The committee is made up of ten national associations of State and local officials and works closely with many other national organizations interested in traffic safety.

Therefore, nationally, in the States, and in the local communities there is at least an organizational framework of official and non-official highway safety agencies. It seems to me a wholesome start has been made to correlate the efforts of State and local officials and organizations into a militant program to reduce traffic accidents.

The basic lesson which we must teach, enforce, and practice ourselves, is good driver and pedestrian behavior. As I have said, to get it across we need to organize for continuing action in support of a balanced traffic safety program. The objectives are to save lives, prevent injuries, and reduce economic waste. No business can conduct its affairs successfully if waste is not cut to a minimum. What is true of business is true of the Nation. We cannot afford to squander our resources. Nationally, we can save billions of dollars, millions of injuries, and thousands of lives by eliminating the preventable motor vehicle accident. Isn't it worth working for?

Development of the Missouri River Basin

EXTENSION OF REMARKS

OF

HON. JAMES E. MURRAY

OF MONTANA

IN THE SENATE OF THE UNITED STATES

Thursday, September 27, 1951

Mr. MURRAY. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD an article entitled "Missouri Waltzes to Billion Dollar Blues," by Albert H. Jenkins, which appeared in the *Machinists Monthly Journal* for October 1951.

This article deals with the recent disastrous floods in the Missouri Valley and the expensive problem they have created for our country. It demonstrates the need for an over-all program for the development of the Missouri River Basin and control of these destructive recurring floods, which continue to cause irreparable damage to our economy.

There being no objection, the article was ordered to be printed in the RECORD, as follows:

MISSOURI WALTZES TO BILLION DOLLAR BLUES (By Albert H. Jenkins)

Another huge and expensive problem has been dumped in Uncle Sam's lap. Or rather, it has been there a long time, but has been given new urgency by the disastrous Missouri flood.

Something must be done about it quickly and on a vast scale, but what? That's what people in the Missouri Valley think and deeply feel, as they survey the wreckage.

A billion dollars' damage. At least a million farm acres flooded, with homes, barns, and other buildings washed away, and livestock drowned. Millions of tons of good topsoil gone down the river never to return. Railroads and other industries hit a terrific blow. Forty-one human lives lost, and lucky it wasn't more.

No man's mind can fully grasp the size of the disaster. In one industrial area, alone, it has been compared to the results of an atomic bomb.

The flood is over, except for an enormous "mopping up," but everyone knows it could come again at any time, and perhaps still worse. It's too big a problem for that region alone to handle. It's up to Uncle Sam.

A VAST EMPIRE

Even he is staggered when he looks at the size of the problem. The valley of the Missouri River and its tributary streams stretches far and wide through 12 States. Most concerned are Missouri, Kansas, Nebraska, Colorado, South and North Dakota, Wyoming, and Montana. It's a vast "empire," far bigger than most nations, and floods are only part of the still bigger problem which must be solved to make that broad area safe and rich for this and future generations.

Almost everyone agrees on that, but people differ on what's to be done, and how. Various plans have been proposed but only three have powerful support. These three are:

1. The Pick-Sloan plan, named after Maj. Gen. Lewis A. Pick, Chief of the Army Engineers, and Glenn Sloan, former regional engineer of the Interior Department's Bureau of Reclamation.
2. The Missouri Valley Authority plan, patterned after the Tennessee Valley Authority, and embodied in a bill recently introduced by a group of 14 Senators, headed by Senator JAMES E. MURRAY, of Montana.
3. The Department of Agriculture plan, which, in general, can be described as between Pick-Sloan and Valley Authority.

HOW SITUATION AROSE

A little history will help explain how these plans came about, and the differences between them.

For about a century, the Army engineers have been Uncle Sam's chief reliance for flood control. They have spent billions of dollars in attempts to control the Mississippi, Missouri, and other rivers.

Critics of the Army engineers say they have looked at the flood problem from too narrow a viewpoint. For the most part, they simply built levees and embankments along rivers, to hold high water and keep it from flowing over nearby land. When the engineers built dams, it was charged that they produced as little public electric power as possible, thus favoring the power trust.

At any rate, the Army engineers felt the Missouri Valley flood problem was theirs, as such things always had been. They made it evident that they resented anyone else invading their field in the valley.

The Interior Department's Bureau of Reclamation has an old interest in problems closely allied to flood control, because it has

long built dams to hold water for irrigation purposes. Incidentally, many of these dams also provide cheap public electric power, largely for the farmers on the irrigated lands.

WERE BITTER RIVALS

A bitter battle began some years ago between the Army engineers and the Reclamation Bureau. Each wanted to undertake gigantic tasks in the valleys of such great rivers as the Columbia and Missouri. Each charged that the other didn't know how to do the job, and they attributed to each other selfish motives.

Then came what has often been called the shotgun wedding. The Army engineers and Reclamation Bureau compromised their differences, to ward off a threat from a new competitor.

The success of TVA produced demands for a Columbia Valley Authority and Missouri Valley Authority. If those demands succeeded, neither the Engineers nor the Bureau would be boss in the valleys. They would have to take orders from a Federal authority—a board which would supervise all public work done in a valley, do most of the planning, and actually carry on most of the work which the Engineers and Bureau consider theirs.

In the great Columbia Valley of the Northwest, the two old rivals settled their differences by saying: "You build this dam, and I'll build that one." "You do this job and I'll do that."

As a result, some critics claim, there is no adequate planning for the valley as a whole, and the results may prove costly to future generations.

SUDDENLY BECAME FRIENDS

In the Missouri Valley, the engineers and Bureau came even closer together after the late President Roosevelt in 1944, proposed a Missouri Valley Authority. The two old rivals suddenly became good friends, and proposed the Pick-Sloan plan.

Its size staggers the imagination. It includes 150 big dams, irrigation of 5,000,000 acres, partial irrigation of 2,000,000 more annual production of 13,000,000,000 kilowatts of electric power, deepening of 750 miles of the Missouri for navigation, and construction of 1,500 miles of levees.

One dam, alone, would form a lake with a shore line longer than Lake Erie's. To clear the ground for this new lake and many others, thousands of farms and town families would have to move to other locations. A heavy price to pay, but worth it if the Pick-Sloan plan is the right one for remaking the vast Missouri Valley.

Many millions of dollars have already been spent building dams under the Pick-Sloan plan, and its friends say this kept the flood from being still worse.

Friends of the authority plan and the Department of Agriculture plan charge that the Pick-Sloan plan neglects such things as "soil conservation" and "reforestation" which help the ground absorb falling rain and melting snow, and thus make them run off more slowly, and decrease floods.

Pick has often publicly stated that soil conservation and reforestation are good things, but that they don't help much in preventing flood. Recently, however, he has been talking in a more friendly way about such things, perhaps in hope of softening some of the opposition to the Pick-Sloan plan.

VALLEY AS A WHOLE

The valley-authority plan requires little explanation, because it has been made familiar by TVA. Its friends say it is the way to make sure that all the problems of a great valley are treated as a whole.

The Department of Agriculture plan differs from both Pick-Sloan and valley authority,

both in the method of administration, and in emphasis on the relative importance of various parts of the problem.

A spokesman for the Department explained that its plan would set up a basin commission, which would plan and program the work in the Missouri Valley, but would not actually do the work. Thus the commission would not supplant the Army engineers and the Reclamation Bureau, as a valley authority would.

The commission, however, would assign jobs to the Army engineers, Reclamation Bureau, and other Government agencies, and thus correct the unbalance and distortion of the Pick-Sloan plan.

"Any unified program, either ours or the valley authority," the Department spokesman said, "is better than the Pick-Sloan plan, which would do only part of the job. We want to see all land and water resources in the Missouri Valley developed in a comprehensive way."

"The Water Policy Commission, appointed by President Truman, studied the entire problem and recommended basin commissions such as the one we propose."

A GOVERNOR'S VIEWS

The Army engineers and Reclamation Bureau—particularly the former—have a lot of influence with Congress, and their plan is backed by a majority of the governors of the Missouri Valley States. A former governor of one of those States explained their stand this way:

"The members of a valley authority would be appointed by the President. The State with the greatest interest in the problem might not be represented on the authority, or have any say in its decisions."

"Some of our State governments fear the authority would take control over the water in their States, whose constitutions say the control of water is in the State governments. Water, of course, is far more important to the farmers of a western State than most people in the East understand. If this water problem could be solved under the valley authority bill, there would be less opposition to it."

"Also, we fear a valley authority would go into a State and build dams we don't want. The Army engineers and Reclamation Bureau can't build a dam until they get an O. K. from the government of the State in which it would be located."

"Anyway, we want action on the Missouri Valley problem, and I don't believe it is possible to get any valley authority bill through the kind of Congress we have now."

MURRAY'S PLEA FOR MVA

An argument for the Missouri Valley Authority was made by Senator MURRAY, in introducing the bill sponsored by 14 Senators. The bill is similar to one he introduced several years ago. After reviewing the enormous damage done by the latest flood, MURRAY said:

"How long must this go on? Will we continue to allow the uncoordinated efforts of the Army engineers and Reclamation Bureau to try to make a go of their shotgun wedding, and to parcel out projects on the Missouri River and its tributaries?"

"Can we continue to permit those two great agencies to flounder and fail in providing a comprehensive plan of flood control, irrigation, soil conservation, reforestation, and recreation?"

"The basic wealth of the United States consists of our vast expanses of rich agricultural lands, our extensive forests, our mineral resources, our great system of rivers, and potential electric-power resources."

"The American people are the trustees of this great heritage. Acting through their Government, they have the sacred responsibility to preserve these riches for succeeding generations."

POINTS TO POWER TRUST

"Some years ago, I joined with a number of other Members of this body in presenting a bill to provide a unified, integrated program for control of these floods and the development of the Missouri River system. But, because of the pressure of powerful lobbies in Washington, that measure has been ignored."

"The great stumbling block seems to be power. If Congress would surrender to the private power lobby and provide a program of river development under which all electric power would be delivered directly to the private utilities at the bus bars, the fight against proposed river authorities would end."

It is obvious that the Missouri Valley fight involves not only electric power but also another kind of power—of various Government agencies and their chiefs. They seem to be thinking too much of building up their rival personal "empires," instead of building up the Nation's great "empire" in the Missouri Valley.

It's too big a thing for such selfish rivalries. All should be thinking only of the interests of the people of that vast valley, and of the entire country.

Time, dispute, and discussion have brought the opposing sides somewhat closer together. Is it too much to hope they will finally agree on the kind of program the valley and America ought to have? But the floods won't wait. The time for action is now.

A Free Press Gallery

EXTENSION OF REMARKS

OF

HON. FRAZIER REAMS

OF OHIO

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. REAMS. Mr. Speaker, under unanimous consent, I include in the Appendix of the Record an editorial from the Toledo Blade of September 25, 1951, on the subject of a free press gallery. This, of course, refers to our Press Gallery here in the Congress.

This editorial expresses my own personal view and, I believe, the view of many of the Members of this House that "the American press ought to stand by its belief that the free flow of information in the world is desirable, and not lift a finger to check it out of spite, even though the spite be justifiable."

A FREE PRESS GALLERY

By rejecting the demand made in the name of the American Society of Newspaper Editors that representatives of Tass, the Soviet press agency, be barred from the press galleries of Congress, the standing committee of correspondents has indicated that reporters covering Washington news are maintaining greater mental stability in these trying times than some of the editors who employ them.

The move to toss the Tass men out was launched about a month ago by Alexander F. Jones, president of the ASNE, whose authority for committing the organization to such an undertaking has not been brought to our attention.

In a widely publicized statement entitled "A Call for Courage," Mr. Jones asked for their expulsion on the grounds (1) that Tass is not a news service in the American sense but a propaganda organ of the Soviet Government; (2) that the Soviet Union does not

accord our newspapermen the privileges which Tass representatives enjoy in this country, and (3) that it makes him mad to see them walking into the White House for press conferences while Bill Oatis, the Associated Press correspondent in Czechoslovakia, is kept in jail.

Now, if it takes courage to get mad, it is to be assumed that Mr. Jones has his quota. But we don't quite see how losing our temper, even collectively, is going to help Bill Oatis or serve the best interests of the United States in the struggle with the Soviet Union. And except for some quibbling over the press gallery rules which the standing committee probably understands better than any outsiders, supporters of the ouster move have confined their argument pretty largely to indignation.

Their reasoning runs along these lines and in these words: "American newspapers * * * can get off their dead posteriors and start to fight." "I say throw them out." "Throw 'em out, I say—and right where they'll land the hardest." "It is little short of idiotic to call any of these birds newspapermen." "Let's get shed of them." "The galleries should be purged of Tass."

Happily, not all of our American editors have succumbed to this communistic urge to purge. Those who have kept their heads instead of losing their tempers have pointed out that such retaliation is hardly likely to get Bill Oatis out of a Czechoslovak jail and that admission to the press galleries of Congress can hardly facilitate spying since the transcripts of its proceedings are published in the CONGRESSIONAL RECORD, anyway.

But the chief objection to this ASNE move is not that it's just a futile game of tit for tat which won't do our press or our country any good.

Simply for propaganda purposes, as Lester Markel, Sunday editor of the New York Times has said, it is desirable for us to be able to tell all people everywhere, "Look, a representative of Tass can attend a presidential press conference in the United States. That is how free we are and how little we are afraid."

Even more important, the American press ought to stand by its belief that the free flow of information in the world is desirable and not lift a finger to check it out of spite, even though the spite be justifiable.

In undertaking to crack down on the Tass representatives in retaliation for the brutal treatment given Bill Oatis, aren't ASNE officials, who haven't submitted their proposition to a vote of the membership, trying to exercise a governmental function just as they accuse Tass of doing?

Thirty-third Anniversary of the Battle of the Meuse-Argonne

REMARKS

OF

HON. LEROY JOHNSON

OF CALIFORNIA

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. JOHNSON. Mr. Speaker, I wish to call to the attention of the House the fact that 33 years ago today the great Meuse-Argonne drive started in France. At that time we had the largest Army on the front in a battle that we had ever had up to that moment.

There are a number of men in the House and in the Senate who were in that great battle, which heralded the beginning of the end for Germany

We thought we were fighting a war to end wars. I hoped and prayed for years that that was what we were doing, but the things that have gone on in the last 30 years have given many of us a distinct and terrifying shock. I never thought I would live to see such a topsyturvy, uncertain, and explosive world as we live in. Everyone knows that there is not a boy today between the ages of 10 and 17 that can make any plans for his future. I hope we may find some way to level off the world on a peaceful basis, and that the dream we had in 1917 will come true sometime during our lives.

Crime on the Water Front

EXTENSION OF REMARKS

OF

HON. ALEXANDER WILEY

OF WISCONSIN

IN THE SENATE OF THE UNITED STATES

Thursday, September 27, 1951

Mr. WILEY. Mr. President, I send to the desk a statement I have prepared and certain other material regarding crime along the water front, a situation which has been described by experts as the most critical area of illegal operations in America today. I ask unanimous consent that the statement and this material be printed in the Appendix of the Record.

There being no objection, the statement and the materials were ordered to be printed in the Record, as follows:

EXPOSURE OF WATER FRONT SITUATION (Statement by Hon. ALEXANDER WILEY)

Last Thursday I placed in the CONGRESSIONAL RECORD beginning on page A5755, a statement regarding the need for a continuing probe of interstate crime with particular reference to crime along the New York-New Jersey water front.

This is a situation in which I have been interested for many years. Long before there was such a thing as a Special Senate Crime Investigating Committee, I urged that the water front be investigated. When the crime committee was set up, I urged again that it be investigated. When the crime committee received a 4-month extension earlier this year, still again. When the Senate Commerce Committee took over the special committee's jurisdiction, I urged still again.

In every instance, I received kind acknowledgment from my colleagues. I was advised of their interest in the situation, but they cited the reason that sufficient time and resources were not available for the study.

Now, once more I renew the appeal. In my judgment, the situation along the water front is crying to high heaven for cleaning up. This is not a job, of course, for Uncle Sam alone. It is a job for cities in the New York-New Jersey area, for the State governments at Albany and Trenton, and for the Federal Government in Washington. We here cannot shirk our responsibilities any more than any other level should shirk its responsibility, or any more than honest union leaders and businessmen should shirk theirs. The situation is an international one, and not just a local, State or National problem. It will never be cleared up unless a lot of people show a lot of guts.

At this time, I have the text of the Columbia Broadcasting System program in the Nation's Nightmare series, describing graphically and principally by the means of tape-

recorded interviews, the outline of this situation. I had mentioned this splendid, hard-hitting Nation's Nightmare series in last Thursday's CONGRESSIONAL RECORD.

I also have the text of an International News Service article written today by Mr. Malcolm Johnson, the distinguished winner of the 1949 Pulitzer Prize for his exposure of crime along the water front. This article and the transcript of the powerful CBS broadcast, are appended hereto.

NATION'S NIGHTMARE

(Alarm ringing.)

Mr. Downs This is an alarm sounding in a police station somewhere in the United States. The alarm is meant for you. It's a warning to wake up, to shake loose from the grip of the Nation's nightmare, the nightmare described by Senator HENRY O'CONNOR.

Senator O'CONNOR. Our Senate Crime Investigating Committee has found alarming instances of syndicated crime and of unhealthy alliance with law-enforcement officials. The remedy is in the hands of the people who must act before it is too late.

(Music)

ANNOUNCER. The Nation's nightmare. The CBS radio network and its affiliated stations, in cooperation with law-enforcement agencies throughout the country, present a new documentary series on the pattern of organized crime in America, its shape, its form, who runs it, and what can be done about it. Every voice and sound you will hear has been recorded from real life.

Now, here to report to you on the Nation's Nightmare is the noted CBS newsmen, Bill Downs.

Mr. Downs For many weeks now we've been looking into the dirty corners of organized crime in America. The picture has not been pretty, but, if you were to ask us, what is the worst single spot in the United States today, where does organized crime most endanger the public safety? we would give you our unanimous answer—the New York-New Jersey water front. The record of racketeering, exploitation, extortion, conspiracy, and murder is so foul that it's hard to believe, even when you have the documented proof before you; but it's true—shamefully, unquestionably true. On this, the fifth program of the Nation's Nightmare, we look into crime on the water front.

(Fog horn blowing.)

(Boat whistles under.)

The New York Harbor, the greatest port in the world; 11,000 ships enter and leave it every year; \$16,000,000,000 in cargo pours through its gates every year. Nature outdid herself in the New York harbor. It's shore line is 755 miles long, fronting on good, deep water. Within the master port lies a network of smaller ports, channels, rivers, and bays. The perfect harbor, the experts say. The perfect harbor, the mobsters and criminals agree. The perfect harbor for getting away with murder.

GUMK. We're passing under the Brooklyn Bridge. We are now rounding the tip of Manhattan Island. On your right is—

Mr. Downs. Come aboard the little sightseeing boat that circles Manhattan Island. Come aboard for a trip around the port of New York. Come and meet the people who control the port. You're steaming down the East River, heading for the mouth of the harbor and the Statue of Liberty.

GUMK. On your left is Brooklyn.

Mr. Downs. Brooklyn water front controlled by Albert Anastasia, "lord high executioner" of Murder, Inc.

VOICE. We're passing under the Brooklyn Bridge. On your right is the lower East Side.

Mr. Downs. Lower East Side controlled by Mike Clementi, lieutenant of "Socks" Lanza, one conviction, associate of now-executed murderer, "Squint" Sheridan.

GUMK. There is the Fulton Fish Market. We are now rounding the tip of Manhattan Island.

Mr. Downs. The water front from the Fulton Fish Market, on the East Side, to Pier 9, on the West Side, the famous tip of Manhattan Island, controlled by "Socks" Lanza, pal of "Lucky" Luciano, ten arrests, now out on parole after conviction for extortion.

GUMK. Directly ahead of you, out in the harbor, is Staten Island.

Mr. Downs. Water front controlled by Alex Dibrini—one conviction, organized for the International Longshoremen's Association, the ILA, now up before the New York State Crime Commission.

GUMK. Off to your left is the Jersey shore. There's Jersey City.

Mr. Downs. Three groups fighting for control. Upper hand is being held by the Morris Manna mob, fronting for Albert Anastasia.

GUMK. We are now going up the Hudson River. On your right is Greenwich Village.

Mr. Downs. Piers 14-52, Hudson River, controlled by the remnants of the Dunn-McGrath mob. Ed McGrath, organizer for the ILA, ex-convict, two-time loser, Hot Springs guest of Joe Adonis, ex-partner of murderer Johnny "Cockeye" Dunn, who was a pal of Meyer Lansky and "Bugsy" Siegel.

GUMK. On your left is Hoboken.

Mr. Downs. Controlled by convicted bootlegger Edward Florio, organizer for the ILA, successor to Charlie Yanowsky, notorious hijacker and gunman murdered in 1948, who was a pal of Mickey Cohen and "Happy" Melzer.

GUMK. And on your right is the Chelsea section, which runs from Fourteenth to Twenty-third Streets.

Mr. Downs. The Chelsea area, piers 53-62, split between Timmy O'Mara, one of killer Owney Madden's mob, and the Ding-Dong Bell mob.

GUMK. On your right is upper Times Square and upper midtown Manhattan.

Mr. Downs. Controlled by the Mickey Bowers mob, home of local No. 824, ILA, widely known as the Pistol Local.

The New York-New Jersey water front, the greatest port in the world. The greatest concentration of mob power in the world.

(Whistle)

HIRING BOSS. No. 1 deck gang. No. 1 hold gang. No. 1 dock gang. Only you regular men step out (Voice continues under.)

Mr. Downs. There is organized crime on the New York water front because conditions are right for it. Those conditions start with the outmoded way in which men are hired for work on the water front. You are listening to that hiring. It's called the "shape up." Twice a day, at 7:55 a. m. and at 12:55 p. m., a group of 200 to 500 longshoremen line up in a semicircle before the pier where the ship is to be loaded or unloaded. The hiring boss, whom you hear, picks out the gangs of men who will work for the next 4 hours. After that they are out of a job unless selected again in the next "shape up." The hiring boss, himself a member of the Longshoremen's Union, has absolute power in picking the men. When the mobsters control the hiring boss it breeds crime and worse. Assemblyman John R. Brook, of Manhattan, has tried to get the "shape up" abolished. He was opposed by the shipping interests and by the Longshoremen's Union. He can tell you about it.

Mr. BROOK. The men are caught in a net from which they cannot extricate themselves. The ones who work are the ones who have been able to curry favor with the pier boss, who have probably paid the highest tribute, who have patronized his friends and relatives, who have borrowed on their future earnings from his money-lenders at rates that impoverish him and deprive his wife and children of necessary food and clothing. They must do his bidding or else—no work; and "no work," no pay.

Mr. DOWNS. Who are some of these hiring bosses who have absolute power over the men on the piers? Let's look at the most important four docks on the New York waterfront, the piers between Manhattan's Forty-second and Fiftieth Streets on the Hudson River, the piers controlled by the Mickey Bowers mob. James Walsh is manager of the New York City Anticrime Committee. He can tell you about these men. [Pause.] Pier 84, berth of the American Export Lines, the *Constitution*, the *Independence*.

Mr. WALSH. Hiring boss, Danny St John, ex-convict, over 20 arrests, one prison escape, tried twice for murder in the first degree. Jury disagreed both times.

Mr. DOWNS. Pier 88, berth of the French Line, the *Ile de France*, the *Liberte*.

Mr. WALSH. Hiring boss, Toddy O'Rourke, 10 arrests, sentenced to 5 years in Sing Sing for grand larceny, a parole violator.

Mr. DOWNS. Pier 90, berth of the Cunard Line, the *Queen Mary*, the *Queen Elizabeth*.

Mr. WALSH. Hiring boss, Jimmy Clifford, 14 arrests for robbery or assault, 1 year probation for jostling, 18 months in the penitentiary for grand larceny.

Mr. DOWNS. Pier 92, also the Cunard Line. Mr. WALSH. Hiring boss, Jimmy McNay, alias Jimmy Heyer, seven arrests, sentenced to the reformatory for unlawful entry and to Eastern State Penitentiary for 7½ to 15 years for gang robbery.

Mr. DOWNS. These are the hiring bosses in one section alone. All are members of the Pistol local. Not all hiring bosses have records, but enough of them do to make anyone cry out—why? Why are they permitted to hold positions of life and death over the jobs of longshoremen? Ask the longshoreman who works under the hiring boss. He can give you the real answer. Only he won't. He won't if he knows what's good for him. We wanted to record several longshoremen for this program. No one would talk to us. We finally convinced a number of longshoremen in different parts of the port to talk by guaranteeing that we would not play their voices on the air—they might be identified. You are going to hear their stories, but through the mouths of intermediaries, professional actors. Here are your intermediaries.

Mr. QUINN. My name is Bill Quinn. I've heard the water-front tape recordings. Believe me, they're true. I'll repeat them for you, word for word.

Mr. GOSFIELD. I'm Maurice Gosfield. I've heard the records, too. We'll try to catch the flavor of the recordings without revealing the people who made them.

Mr. DOWNS. Ask the longshoreman what would happen to him if he talked. What would happen if he registered a protest? One longshoreman told us this. Here are his words in the voice of Bill Quinn.

Mr. QUINN. Well, you can always have an accident. They're very convenient. You could be walkin' and a guy could be raisin' a boom on a crane. The boom weighs about a thousand pounds, and I could just pull a lever and raise it and snap what we call the dog on it, and down the boom . . . no more you! Either that or they put you in a barrel and just throw the cement in, and sink you. And, then, the mud in the Hudson, it has a suction of about 12 feet so after you hit bottom you go 12 feet into the mud and they ain't gonna find you no more.

Mr. DOWNS. But that's necessary only in extreme cases. There's an easier weapon. Longshoremen, no matter how rough, are generally good family men. The mobsters, working through the hiring boss, can starve them out. Mr. Gosfield.

Mr. GOSFIELD. Well, if you make a squawk you're deprived of work, definitely fired, and you can't go to work on any other pier. You gotta keep your trap shut. You gotta play the game.

Mr. DOWNS. We asked Ed Florio, organizer for the ILA, in Hoboken, and at the same

time employer of men as a boss leader, his opinion about the records of some of the men and about crime on the water front. This is what he said.

Mr. FLORIO. This is Ed Florio, from Hoboken, ILA organizer for the State of New Jersey. They call me an ex . . . ex-convict and I was only arrested once. I was only convicted once, which is conspiracy, in bottling in the . . . during prohibition and I think that any man that drank liquor during prohibition was as guilty as I am for tryin' to make it. As for us being racketeers, you gotta work hard. We use men with records. If we didn't—if we didn't employ them what—what could they do? Use a gun again and go out—go out and do the same thing and go back again? No, we don't do that. We try—we try to re—to rehabilitate the men—the man that has the record. We don't specifically go out looking for them. We always have some . . . some higher-ups call us up—will you please do 'em a favor or somebody . . . somebody always intercedin' for them and we try to help the boys out.

Mr. DOWNS. There are an estimated 35,000 longshoremen working in the New York area. The average longshoreman worked around 1,000 hours in 1950. At \$2 an hour that's an annual wage of around \$2,000. The favored few make out better. On certain rare occasions, an outsider gets a first-hand view of what's going on. Bob Green, reporter for the Jersey City Journal, was at the city desk one Saturday when he got a call from a longshoremen's union local, saying that elections had just been held and new officers were taking over. It was Saturday. The local had 800 members. Only 35 could squeeze into the union headquarters. Bob Green became suspicious. He investigated and this is the story he turned up.

Mr. GREEN. Three men entered the headquarters of local 1247, ILA, 329 Grand Street, Jersey City, longshoremen's union local in Jersey City. They were Morris Manna, a prohibition mobster and former member of the alcohol mob, Barney "Cokeye" Brown, with a long record of many years served in jail, and George Donahue. Seated in the headquarters of the union were Anthony "Slim" Lucey, secretary-treasurer, and Frank "Siffe" DiLorenzo. Manna was the first to speak. He went over to DiLorenzo. He said "You're through." Then, they told DiLorenzo to start running, get out, and keep going. He went. The next one that they turned their attentions to was Anthony "Slim" Lucey. "Lucey, open up the safe," they said. "I'm not going to do it," said Lucey, who had already signed his resignation. He was rewarded for his efforts with a gun butt across the front of the mouth.

It knocked out seven of his teeth and knocked him to the ground. They took several pieces of newspaper, put them on the ground, set fire to them, on the floor of the union headquarters. Lucey's shoeless feet were forced into the fire and held there for several minutes. He suffered severe burns of the feet. That is how three mobsters took over a Local 1247, 329 Grand St., Jersey City, of the ILA, Jersey City.

Mr. DOWNS. Once the mobsters have taken over a union local or a pier through the hiring boss, once they have driven out the honest union officials, they proceed to make life miserable for the longshoremen. A dozen different rackets flourish, all aimed at fleecing the longshoreman of his skimpy pay. Compulsory gambling . . . if you don't play the numbers or bet with the bookie, you don't get called at the next "shape up." Kick-backs are extorted, especially from Italian, Negro, and Puerto Rican workers. The "loan shark" racket flourishes. You pay 10 percent interest per week; 520 percent a year, if you are unfortunate enough to hold a loan that long. Numbers, bookmaking, kick-backs, loan-sharking are controlled by the mobs. But that's not where they make

their big money. The big money comes from organized theft. One of our informants told us how it works. Mr. Gosfield, would you repeat the recording for us?

Mr. GOSFIELD. Yer see, there's two kinds of thefts. There is the commercial thief and there's the guy who steals for home consumption. They . . . take piers 84-87. Up there it's strictly commercial. They steal by the hundred thousands dollars' worth. Yer see, they work with the checker, the feller who checks the cargo when it comes off the ship. Yer see, the checker has a tally book that shows where every piece of cargo is on the ship before the ship arrives. Well, let's say they want to steal five hundred thousand dollars' worth of watches from Switzerland. Well, they know what they want before the ship gets here. The checker is supposed to get the longshoremen to put the valuable cargo in certain spots on the dock. When they want to steal a certain article, the hirin' boss tells the checker and the checker has him put it somewhere else. The checker never marks the cargo as comin' off the ship. See? It never did arrive in this country, so it's lost somewhere between here and France or wherever the ship comes from. Do yer follow me?

Mr. DOWNS. The cost of water-front theft and pilferage to insurance companies is \$60,000,000 a year and that's only part of the take. Organized theft is the big money-maker for the mobs. Second place is held by a little-known twenty-million-dollar dodge run by the so-called public loaders. Few steamship or company officials will make any direct accusations about water-front crime. They might have a costly strike on their hands the next day, a strike called by the mobsters with the man having no alternative but to follow orders. The honest union official, the honest businessman, doesn't stand a chance. But there's another reason why he won't make a statement, a much more vicious reason. James Walsh, of the New York City Anti-Crime Committee, had run up against that reason. Here he is.

Mr. WALSH. The big thing we're up against is the attitude of too many of the businessmen on the New York water front, who feel it's good for business to hire criminals. They say they're not reformers. They're in business to make money. If they had the choice between hiring a tough ex-convict for a boss' job or a man without a criminal record, they'll take the ex-con. The reason? They say the ex-con will keep the men in line and get the most work out of them.

Mr. DOWNS. The water front is a jungle where men spend their lives in fear, where the big eat the little, where the secret channels of influence, corruption, and crime flow just beneath the surface. One longshoreman probed that jungle for us and showed us how it works. The legitimate guy is in the middle. Mr. Quinn will repeat the recording for you.

Mr. QUINN. Yer see, the big boys need the tough guys. They need the tough guys to keep me in line so I don't get too brazen, upset their way of runnin' things. They—they also need the police department to keep the tough guys in line. If the tough guys go too far the police cut them down; and then they use the politicians to see that the police don't go too far and they've got the politicians' cuz—well, they kin use their muscle men to line up the vote for him. It's a three-ring circus. The legitimate guy's in the middle.

Mr. DOWNS. The boss of the International Longshoremen's Union is big, burly Joseph P. Ryan. He is president of the union for life. His constitutional powers put him in absolute control over union matters. He appoints and can fire the union organizers, men like ex-convicts Ed Florio, and Ed McGrath, and Alex Dibrizzi. Mr. Ryan defends the "shape up" hiring system.

Mr. RYAN. When I went to work longshorin' in 1912, you stayed on the pier from 7 o'clock in the mornin' to 7 at night, to protect your job because the hiring stevedore could come out any hour, 15 minutes after the hour or 5 minutes after the hour, blow the whistle and if you weren't there you lost your opportunity to secure work. These men, through the collective bargaining, through their collective strength, have changed that condition that now, if they are not hired at 7 55 in the morning, or at 12 55 at noon, they go home till the following morning at 8 o'clock and nobody can take their place.

(Music under.)

Mr. DOWNS. Once a year, at a fancy mid-town New York hotel, the Joseph P. Ryan Association gives a testimonial dinner to the man they call "Our Standard Bearer, Joseph P. Ryan." At that dinner you can find some strange combinations. Do these important people know about the guests at the other tables? At one table you'll find the mayor of the city of New York, the Honorable Vincent Impellitteri. At another table you'll find ship-jumper Jerry Anastasia, brother of the notorious Albert Anastasia.

The chairman of the arrangements committee is the wealthy and influential businessman, William J. "Bill" McCormack, president of the Transit-Mix Corp. and the Penn Stevedoring Co., and you can see John A. Coleman, former chairman of the board of governors of the New York Stock Exchange, while a member of the reception committee is Willie Cox, who did time in Elmira for biting off the ear of his neighbor. High police officials, high government officials, turn out for the dinner, for that dinner is a symbol of political power, a symbol of the votes that come out of the water front and its associated industries. This perhaps is the ultimate reason behind the water-front problem. It is politically dangerous to interfere with the set-up. So almost everybody in New York-New Jersey rides the water front merry-go-round, and the merry-go-round goes like this.

(Whistle.) The mayor says it's a job for the police and the DA. (Whistle.) The DA says the steamship companies and unions must take the responsibility. (Whistle.) The steamship companies say it's a job for the police and the mayor. (Whistle.) The police say the water front is as quiet as a church. (Whistle.) The commissioner of investigation says it's a labor-management problem. (Whistle.) The union says everybody spreads rumors, none of it is true. (Three blasts of whistle.)

Mr. DOWNS. We have only started to look at the water front crime picture. We haven't mentioned the ship-jumpers' racket, the dope smuggling, the phony social security cards. But there is something even more ominous. There is a single individual so big, so influential, that he cannot be touched and that individual is the power behind crime on the water front. That individual makes politicians, police, and union officials jump. That individual is "Mr. Big." We think we know his name. People who really understand the water front know his name, too. They all agree on who is "Mr. Big." Bill Keating is assistant manager of the New York City anticrime committee and a former assistant district attorney of New York. He can tell you about "Mr. Big."

Mr. KEATING. "Mr. Big" is an important, respectable businessman. He is a church-goer. He contributes to charitable causes. He is a close friend of governors, mayors, and important political figures past and present. He started out on the lower West Side of New York. His first work was driving a one-horse wagon in the market. He became involved in a struggle for power in one of the locals of the Teamsters Union. Early in World War I, he was involved in the loading of meat for the American troops in Europe and made a fortune at it. It was a rough business. Three contemporaries, Mickish

Keating, Tanner Smith, and "Rubber" Shaw were murdered. With money to back him, he stepped in and took over more and more unions on and off the water front. He found himself in a handy little position.

On the one hand he controlled certain key union locals. On the other hand he owned and operated the very businesses that those key unions serviced. This put him in a beautiful position to make even more money. He obtained juicy city contracts. He expanded his empire into more and more unrelated businesses. Politically, while he has been identified with one party, he plays both sides of the fence and he sees to it that each party gets a share of whatever labor support he can deliver and that each party gets a share of campaign contributions. No one has been able to prove that "Mr. Big" has committed a crime, but win the confidence of any old-time longshoreman, any veteran newspaper reporter, any cop who knows the West Side, and he'll tell you the name of "Mr. Big." Who is "Mr. Big"?

Mr. DOWNS. Well, who is "Mr. Big"? We can't tell you his name because there's not enough legal evidence to back up what every seasoned waterfront investigator knows, but we are convinced he's the real power behind the throne. What can be done about crime on the water front?

Well, the New York City anticrime committee, a group of private citizens organized to fight the gangsters, is a start. Spruille Braden, former ambassador to Argentina, heads the organization. He can sum it up for us.

Mr. BRADEN. The port of New York, the greatest port in the world, is being strangled by inefficiency but, even more, by crime and by political corruption. This is not a local matter. It affects every citizen in every one of the 48 States. These conditions have existed for over 30 years and they must not be permitted to endure any longer. The organized gangsters and racketeers must be driven off the water front. The archaic means of hiring, defended by the International Longshoremen's Union and the shipping interests, must be improved. The pattern of police connivance and political corruption must be cleaned up, and the power is behind the throne, the shadowy people who hide behind the cloak of respectability—they must be exposed. This is your problem. You must do something about it now.

Mr. DOWNS. Will you do something about it? Or will you let the rackets go on, the violence go on, the murder go on. The murder of good people, honest people, who only seek to lead a decent life on the water front of the greatest port of the Nation, the murder of men like Walley [Alluoto], who only 3 months ago, was about to become hiring boss on pier 3, in Hoboken. The mob did not approve of him. He might interfere with the operation of their racket. They killed him at union headquarters in Hoboken. Do you want to know what kind of a man he was? His widow, Mrs. Elizabeth Alluoto, can tell you. She speaks for the record. She did not want her voice impersonated by any actress. She speaks to you.

Mrs. ALLUOTO. They didn't come any better—he is greatest. Oh, he thought the world was his when he could talk about the kids, how they went to school, and where they went to school and how he hoped to see them graduate and how he felt that they were getting some place in the world, that in the future he hoped that they'd never have to work as hard as he and I did. His last thoughts, his dying thoughts, was his home. He had someone very close to him pay the telephone bill and the gas and electric bill, and he was dying.

How this could have happened, I don't know. I don't know. I can't—I can't accept it as yet. I've been out to the cem-

tery and I know it's so, yet I can't believe it. I keep waiting for that key in the door. [Cries.]

ANNOUNCER. You have just heard program No. 5 of the Nation's Nightmare, narrated by Bill Downs, presented transcribed as a public service by the CBS radio network, written and produced by Irving Gitlin.

Special acknowledgments to the numerous longshoremen, who risked their lives to give us the information used in this program.

(By Malcolm Johnson)

WASHINGTON, September 26.—Senator ALEXANDER WILEY, Republican, Wisconsin, said today that it was time for the United States Government to end organized crime and racketeering on the New York-New Jersey water front.

Describing the water front as presenting one of the "worst situations in America today," WILEY said he was urging the Senate Interstate Commerce Committee to launch an intensive investigation immediately after the congressional recess, probably in mid-October.

The Wisconsin Senator said he personally regretted that the Senate Crime Committee, of which he was a member, had not explored water-front crime more fully, but that since this committee had expired he was now urging the job on the Commerce group.

But if the Commerce Committee intends to act, WILEY declared, it must move promptly, because time is running short. It should ask for and get the necessary money to finance a thorough, vigorous investigation, he said, during the next 2 weeks.

Indicating that other authorities in the past had ducked the water-front crime problem, WILEY declared:

"It is Uncle Sam's job to clean up the water front and then to have the job carried on by local and State officials.

"Once the congressional session is over, the Senate Commerce Committee should begin some real spadework to get at the bottom of organized piracy and other crimes on the New York water front."

Since the Crime Committee's expiration, WILEY said that a mass of material on water-front crime had been turned over to the Commerce Committee headed by Senator EDWIN C. JOHNSON, Democrat, Colorado.

JOHNSON has informed him, said WILEY that his committee is now busy with hearings on legislation recommended by the Crime Committee, but is giving consideration to the proposal for a new waterfront probe.

WILEY said that the water front poses an international problem, involving hundreds of millions of dollars in shipping.

He declared:

"The time is long overdue when the United States Government must indicate to organized gangsterism on the waterfront who is going to be boss, the big shots in waterfront crime or Uncle Sam.

"The present situation is a cancerous one which can be suicidal for New York-New Jersey shipping, if it remains unchecked.

"It is paradoxical that the west coast, which I have just visited in connection with the signing of the Japanese Peace Treaty, faces the problem of a Communist stranglehold on the water front, while the east coast faces the problem of a criminal stronghold."

WILEY said:

"An unholy alliance between questionable elements in labor and the shipping business is exacting a staggering toll on the ultimate consumer."

He was referring, he said, to the numerous rackets on the New York waterfront costing untold millions of dollars a year.

WILEY said a vigorous, honest Federal investigation should endeavor to track down and expose a mysterious businessman who has been identified as the "Mr. Big" of the dock rackets.

Wiley said that he had been informed of the identity of "Mr. Big," but that he considered the over-all problem as much bigger and tougher than unmasking one individual.

"We must attack the basic problem," said Wiley. "Unless the basic problem is solved, there will always be some top boss in the racket, call him Mr. Big or what you will."

Wiley expressed regret that Secretary of Labor Maurice Tobin, to whom he also appealed for a probe of labor racketeering on the docks, was apparently unable or unwilling to make such an investigation.

Food Donations Run Out Before Line of Caterpillar Strike Needy

EXTENSION OF REMARKS OF

HON. HAROLD H. VELDE

OF ILLINOIS

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. VELDE. Mr Speaker, under leave to extend my remarks in the RECORD, I include the following clipping taken from the Wednesday, September 26, issue of the Peoria Star entitled "Food Donations Run Out Before Line of Caterpillar Strike Needy".

FOOD DONATIONS RUN OUT BEFORE LINE OF CATERPILLAR STRIKE NEEDY

An estimated 700 persons, all Caterpillar employees or members of their families without money to buy food because of the strike at the East Peoria tractor plant, showed up to claim 320 bags of groceries Tuesday afternoon.

The groceries or money for them had been donated to the city fire department and were distributed from the central fire station.

After standing in line for 2 hours, those who could not be taken care of were turned away empty-handed.

"We didn't expect nearly so many," exclaimed Fire Chief Dan Donahue. "Only 250 Caterpillar employees registered with us, and we expected to give more than one sack of groceries to some of the needier ones."

As it turned out, those who registered got one sack of groceries, and of those who didn't register, many got nothing.

Collection and distribution of more food is planned. Fire officials will meet today to discuss holding another show, only on a much larger scale, to collect food for the needy families.

Charles W. Baumflek, chairman of the fire and police commission, who was instrumental in arranging for the distribution, said he was amazed at the turn-out.

"These people are really hungry," he said. "They would have to be to come up here and stand in line for a small package of food."

There were people standing in line who several months ago were making charitable donations themselves. Young mothers with two or three children waited patiently while their husbands collected the parcels handed out by firemen.

It wasn't an easy job for the firemen. Many of them handed the packages to friends and neighbors. The remarks of one fireman summed up the whole situation.

"This isn't charity," he said. "It's just giving a helping hand to a neighbor who suddenly finds himself in a tight spot."

Money for the food was collected last Saturday during a variety show held in front of Brook's Fashion Store, 221 South Adams Street. Commissioner Baumflek, who is also manager of Brook's Fashion Store, made arrangements for the show with Roy King, well-

known Peoria singer, radio station WEEK, and Chief Donahue.

Peorians gave \$400 in cash donations and some food. With the \$400, Chief Donahue and Assistant Chiefs Rudy Kneer, Ray Miller, James Barden, and Ed Nash, went shopping. The firemen displayed an eye for bargains that would amaze most housewives.

With only the \$400 to go on, they gathered together more than \$1,000 worth of food. Into each package they stuffed beans, bread, bacon, puffed wheat, pork and beans, flour, spaghetti, peas, margarine, condensed milk, corn, sugar, potatoes, apples, cottage cheese, and milk. Each family received a half gallon of milk. Those with three or more children were given a full gallon.

Persons who registered beforehand received their parcels as local radio personalities, Bob Burton of station WEEK, and Robin Weaver of station WIRL, read off their names over the fire station's loudspeaker system.

After these packages were given out, some 80 remaining parcels were handed out to others who had not registered. Their names were recorded, however, to avoid duplication. Several cases of milk remained after the food supply was exhausted, and the milk was handed out to the remaining Caterpillar workers.

"We can't stop now," Chief Donahue said later. "I'm convinced these people need help in a hurry."

The fire chief appealed for additional donations. Food, and cash with which to purchase food if needed. If donations cannot be delivered to the central fire station, a telephone call to the fire department will bring firemen to pick up the donations. All parceling and distribution will be taken care of by firemen.

Needy Caterpillar families, who have not been given food, are requested to telephone the fire department operator and register their names, addresses, badge numbers, and number of children in the family. When enough donations are gathered, the fire department will announce another distribution date.

To Think of Peace as Well as War

EXTENSION OF REMARKS

OF

HON. JACOB K. JAVITS

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 13, 1951

Mr. JAVITS. Mr. Speaker, there is a clear indication in Stephen Spender's *To Think of Peace as Well as War*—New York Times magazine, August 12, 1951—appended hereto, how the world trend can be reversed. Today we see that actions begin in the minds of men; the ancients knew that "energy follows thought." Thus a sharp, continual, conscious focus upon the objective of world stability and peace would release a flood of energy and practical effort in that direction. World policy makers might well ponder this concept:

TO THINK OF PEACE AS WELL AS WAR—THIS IS THE WAY TO AVOID THE GREAT DANGERS OF SABER-RATTLING AND TIMOROUS PACIFISM
(By Stephen Spender)

There is an uneasy, almost superstitious fear in many people's mind that war is brought closer by their thinking about it. Catchwords like "the cold war," "the war of nerves," and so on, partly imply the idea of a kind of mental war already taking place. It is as though thoughts were actors in a

Greek tragedy going on inside our heads; an interior tragedy bound in the long run to break out into external terror and destruction. Is there a truth in this widely held belief: is war brought closer by people thinking about it?

It is true that thinking about violence may lead to a state of mind in which people actually wish for it, even will war. The atmosphere may become so tense that the real thing seems almost a relief, like hearing the name of the fatal illness from which a friend is suffering. Metaphors about storms which are a release after the ominous waiting in thundery air drop into the minds of people with weak nerves.

The enormously enlarged plans for rearmament which have been announced by the western governments since Korea show that we certainly are preparing for war. But the purpose of these preparations, we are told, is not war but peace. This makes it all the more urgent that the material preparations should not produce a widespread state of mind which becomes an impalpable force within the situation, tending to war, perhaps even making it inevitable. This result would, of course, be to defeat the purpose of our preparedness. Yet the danger of a war mentality spreading so that it becomes an impalpable factor working in ways which may well be beyond the calculations of statesmen is serious. In 1935 a political philosopher remarked to me that he had never known an armaments race to begin without its leading inevitably to war. We are faced by a situation in which we have to see that this does not happen now.

Obviously, certain forms of public discussion increase the chances of war. For example, politicians and journalists in the democracies who take advantage of freedom of the press and of speech to proclaim to the world that we should launch war in order to forestall a hypothetical attack on the west are increasing the chances of war by demanding it, and also by giving the east an excuse for launching an attack for precisely the same reasons.

Aggressive talk is one kind of danger. It has its opposite—a timorous pacifism. The neutralist, pacifist discussion which goes on in Europe is really the counterpart of the outbursts of saber rattling in the United States. And just as dangerous, for both encourage the opponent to attack—the one by warning him that if he does not attack us he may be attacked; the other by telling him that if attacked we will not defend ourselves. Both these kinds of thinking are the results of fear. Fear is always dangerous because the frightened person finally discovers that it is better for an imaginary fear to materialize than for him to go on being afraid.

If one is tempted to believe that thinking about it increases the chances of war, it is well to remind one's self that not thinking about it is also dangerous, just as if rearmament is dangerous, disarmament can be dangerous also. A refusal to envisage war and to rearm did not save Britain and France from attack by Hitler.

What we need is neither to think obsessively nor to refuse to think obsessively, but to think calmly and clearly about why we are rearming, and with a determination to avoid catastrophe. Thinking about war, like thinking about any other realistic problem must be a detached means of appraising risks and a rejection of two temptations—escapism on the one side, an impulsive rushing into catastrophe on the other.

At present the entire world seems plunged into an atmosphere of apprehension. We go about in a mood of oppressive realism like characters in a play by Ibsen. This being so, I have heard people express the wish that the present postwar period might resemble the 1920's, which were suffused partly with the idealism of the League of Nations and partly with the gaiety of the bright young

things and the excitement of new ideas in literature and art coming from Paris and Berlin.

Yet the optimism, idealism, and gaiety of the 1920's did not prevent the foundations of the Second World War being laid in a decade which notably failed to solve the main problems of the postwar epoch. These problems were in part the economic conditions which led to unemployment, in part the stultified nationalism of nations which, though weak, refused to merge their sovereignty in the international rule of the League of Nations.

Looking back, it is quite clear that the failure of the period after World War I was a failure of the peoples of the West to be realistic. Without a realism almost as oppressive as our own today the climate could not be created in which the West would make the tremendous economic and political changes necessary to prevent the Second World War. To regret the 1920's is to regret a decade of fatal illusions which led straight into the economic and political disasters of the 1930's, when war gradually became inevitable.

So, if a certain manner of thinking about war makes it more probable, a refusal to think about it at all creates an atmosphere in which it is impossible for statesmen to take measures necessary to prevent war.

The state of affairs most likely to encourage modern warfare seems in fact precisely that of the twenties and thirties, when half of civilization was dreaming unrealistically about peace and refusing to face the issues of the postwar world, while the other half—the so-called have-nots—were thinking with brutal realism about the means whereby they might fall upon these deluded, softened-up haves.

In the nineteenth and twentieth centuries, despite the First World War, the idea of a world in which wars would be unnecessary became so widespread that the greater part of civilization was lulled into a wholly false sense of security. Even after 1933 the world outside Germany, Japan, and Italy was one that had advanced beyond the stage of solving its problems of economic and political rivalry by means of bombs and armies. Large-scale warfare had become so unthinkable to most people that they could not bring themselves to face the measures needed to meet the ill-will of a small minority who had not advanced to the same stage of civilization.

The lesson of recent years is that we have to think in terms of measures which may be used against us. Only a few years ago it was plain that three-quarters of the world had developed beyond the stage of war-mindedness. But World War II showed that we had overestimated the stage of development which the world as a whole had reached. The result has been a set-back, a relapse into universal violence. This is discouraging, not only because it is an enormous waste and diversion of our material resources, but also because it causes us to have to think in barbarous ways which we had outgrown.

However, if we were too optimistic before, there is a danger of becoming too pessimistic now. After all, what has happened is that we have been forced to recognize a state of affairs which is cruder and worse than we had thought. Nonetheless, love of peace and the achievement of many millions of people whose minds have developed beyond the stage of war are not lost.

We have acquired a more realistic understanding of the world, and this can be cause for hope rather than discouragement. The peace of the world could have been saved after 1918 if the western peoples then had shown a little of the grim political realism which is almost universal now. Therefore, our realism, which involves us in being discouraged, may save us from a third world war.

The thinking of ordinary people is not, of course, going to decide the final issue one way or the other. But it may provide the mental environment in which statesmen can decide the peace. Moreover, if a democratic world safe from wars and revolutions is really going to spread its civilization over a larger part of the world than the little areas of Western Europe and North America, the democratic peoples will have to think very hard and very long—as with the fear of God in them—carrying in their minds the problems which make a Chinese coolie or a Slav worker turn to communism, and prepared to pay the price in thinking and material sacrifice which will make freedom identical with bread.

What is required of us is that within our own minds we turn the thinkability of war into the thinkability of peace. We must live, as it were, under an endless sentence of war and yet never forget that to bow to this sentence means the end of civilization.

Soil Conservation and Flood Control— Part I

EXTENSION OF REMARKS

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following address by H. H. Bennett, Chief, United States Soil Conservation Service, Washita River watershed flood-control dedication celebration, near Cordell, Okla., July 8, 1948:

SOIL CONSERVATION AND FLOOD CONTROL

I am especially glad of this opportunity to join with you in this flood-control celebration with Cloud Creek subwatershed of the Washita Valley. It was a long time before the type of flood-control work being done here—although long needed—was finally recognized formally through congressional approval, in the Flood Control Act of 1936.

I also am proud that I was able to have some part in the events that resulted in making upstream watershed conservation a recognized part of our national flood-control program. And it naturally gives me much satisfaction to come out here into such a watershed and see our broadened flood control approach being put into action, the way I saw the work being done on a trip over part of the watershed yesterday, and the way you can see it for yourself here in this reservoir detention phase of the work.

This illustrates what I have long felt is the true situation about floods, namely: Flood control is a job which begins where the rains fall and runoff starts, and ends only when that runoff has safely reached the ocean.

We have come here today to give recognition to one of the most important developments in our agricultural history, but on this particular occasion the purpose of our visit is twofold. First, we are here to see for ourselves the things that are being accomplished in a program which has been designed to reduce flood damage on the tributary watersheds of the Washita River. A second reason for our coming is to focus the attention of the Nation on this program, for the people of the Washita River watershed, aided by their government, have set out on a tremendous undertaking which, when completed, will be

a good job done and a strong inducement to the people of other watersheds to take hold of the flood-control work in earnest.

Today we are observing the unfolding of a new plan of attack on the forces which take the lives of human beings, destroy crops, damage or ruin agricultural land, and take heavy toll of rural and urban property. We are tackling this problem at the very beginning, on the small watersheds far upstream where the raindrops first begin their journey from the land to the sea. From time to time I have pointed out that floods are no more than raindrops, infinitely multiplied and allowed to concentrate into uncontrolled torrents, which sweep destructively over the banks of streams.

If, in a flood-reduction program, we can force this water, or even a considerable part of it, to delay its race to the sea, we have won a part of our objective. Our aim, then, is to hold back as much as possible of the surplus water so as to reduce the height and destructiveness of floods.

We do not claim, in setting out on this undertaking, that we can control major floods with this kind of work alone. Some of the peak flow can be cut down, and this will help, but for the heavier floods there will be needed additional controls in the way of reservoirs, levees, and other main channel operations.

These major engineering operations are the responsibility of the Corps of Engineers. It is our belief that a combination of these programs—the main channel program supplemented by the upstream program—can get the job of preventing and controlling floods accomplished.

At this point, I think it should be mentioned that the two programs have been planned by congressional action, not as any process of substitution of one for the other, but rather for the one to supplement and aid the other. I happen to know when and how the flood-control bill was first changed to add on the upstream phase of the work—and that change didn't take place altogether accidentally. I am referring to the occasion, about the middle 1930's, when it was suggested by the Secretary of Agriculture to the Secretary of War that efforts be made to permit the soil and water conservation efforts of the Department of Agriculture to become a supplemental part of the flood-control program. There was considerable discussion of the matter, but the suggestion was finally accepted—and here it is going into action right before us.

I want to add this point, that it has seemed to me the job of the Department of Agriculture follows closer along the line of flood prevention, while the major engineering operations of the Corps of Engineers follow more nearly along the line of control of floods—after the water gets down into trunk stream channels. This makes a perfect fitting together of the two phases of a comprehensive, completely coordinated program of flood control.

CLOUD CREEK DETENTION DAM

This dam we have seen here today is symbolic of a comprehensive program of proper soil and water use and treatment already well under way. It is true that it is the first such structure, built entirely for flood control, to be completed in such a program. But the program of which it is a part has been going on for months. Other such dams are under construction even now and still others are under contract and are soon to be started.

FLOOD-CONTROL SURVEYS

Congress has authorized more than 600 watersheds for preliminary flood-control examination and survey to determine whether the benefits to be derived from such a flood-control program would justify the cost. The Department of Agriculture has completed preliminary examinations on 154 watersheds

or portions of watersheds, and it has furnished 18 survey reports. Congress has authorized programs of watershed improvement on 11 watersheds in various parts of the country—of which this is one. Some work has been done in each of these 11 watersheds.

FLOOD-CONTROL ACTIVITIES OF THE SOIL CONSERVATION SERVICE¹

The survey work and the operations by the Soil Conservation Service are carried on through our seven regional offices under the general direction of my office in Washington. The Division of Water Conservation in Washington and, respectively, in these seven regions directs the preliminary examinations and surveys and the preparation or work plans.

Turning back a few decades to the time when the land was in virgin condition, there were overflows occasionally, but they were not so violent as now. The land had not been plowed for cultivation. The rains that fell soaked into the ground, nourishing the plants and replenishing the underground water. The streams, because their sources were undisturbed and there was little silt dislodged from the hillsides, ran clear. Nature was in balance.

There are those in this audience who can remember the way the land here looked in those days. Some of you—like John Cassady of Cheyenne—can remember the settling of the Washita. There was much tall grass, roaming buffalo, and clear streams with open channels.

The forces that made these rolling, grass-covered hills and plains have not changed.

The change that has taken place, to the everlasting detriment of the land, has been made by man himself, and man has been the loser.

The situation changed sharply during World War I. The Nation needed cotton and wheat to fight a war. Prices of these and other farm commodities soared to high levels. That brought about the clearing off of a limited amount of timber and the plowing up of hundreds of thousands more acres of grassland in the Washita watershed. And the land yielded its bounty in response to the need.

But following 1917 we have seen the costly disadvantages of using the land without consideration of its character and adaptability. We have seen much of the precious topsoil of the Washita Valley washed away with each rain. We have seen stream channels so choked with the debris of erosion as to reduce their capacity to carry water, by hundreds of thousands of acre feet. We have seen the flood waters drown crops and scour the land of the watersheds. Some of you have even known the tragedy of the loss of relatives and friends as floods swept down the tributaries of the Washita.

Many of you have been concerned for a long time over this wasting away of the valley's soil resource while, at the same time, the problem of flood damage was on the increase. Recently it was called to my attention that one of the chambers of commerce in the Washita watershed made a study of erosion conditions in the area as early as 1930. Many of you realized at that time, I am sure, that this part of Oklahoma was losing something of great value to its economy and that this wastage—of good land especially—was playing a part in adding to the severity of the floods that were seriously hurting the whole watershed area.

It is appropriate, I think, to recall two events that influenced our efforts toward both soil conservation and flood control. On

the night of April 4, 1934, a 10-inch rain brought death and destruction to the locality of Hammon. Twelve persons died that night in the waters that rushed down Kiowa, Sandstone, and White Shield Creeks and on down the Washita. On May 12, 1934, that same year, only 38 days later, there occurred the worst of all the famed black blizzards during what is commonly referred to as the Dust Bowl days.

The flood served to spur the residents of the Washita Valley to more determined effort to get a flood-prevention program started. The duster, carrying millions of tons of soil from the unprotected fields of the great plains, sent its black clouds across the Capital of the Nation and far out over the Atlantic Ocean. These things and their numerous companion disasters elsewhere served at least one purpose: They helped impress the people of the country, and its lawmakers, of the vast cost of needless land abuse.

In the years that followed, you people of Oklahoma were busy. You worked out a plan designed to halt the devastation on the Washita, and you called on your Representatives in Washington for assistance. Your efforts, combined with similar efforts from other localities, resulted in the 1936 Omnibus Flood Control Act adopted by the Seventy-fifth Congress. This act defined and unified the flood-control activities of the Department of War and the Department of Agriculture. As already indicated, it made the Department of Agriculture responsible for flood-control operations on the watersheds, on the upper reaches of the tributaries where the floods actually begin. It made the War Department, through its Corps of Engineers, responsible for the larger flood-control structures on the main stems of our streams.

The Soil Conservation Service and the Forest Service were the Department of Agriculture agencies designated to carry out its flood-control activities, the former working mainly in those areas where agriculture is importantly developed and the Forest Service in the upper headwater areas, occupied to a large extent by national and State forests.

WASHITA SURVEY

The Flood Control Act also authorized the two Departments to conduct surveys of the Washita to find out whether flood-control operations, both upstream and down, would produce benefits that would justify the spending of public funds.

The Department of Agriculture survey covered studies of various phases of the watershed problem: As the agricultural history; type of land, climate, especially rainfall, and the effects of changing conditions on the economy of the watershed. The survey report showed, among other things, that some 900,000 acre-feet of soil had been lost between about 1918, when the growing of clean-tilled crops showed a marked increase, and 1938; approximately 1,100,000 acres had suffered severe erosion; around 2,000,000 acres had suffered some erosion—from slight to moderate; about \$2,250,000 annual flood damage, with farmers bearing about 96 percent of the loss; approximately 2,700,000 acres in cultivation; some 250,000 acres, formerly cultivated, abandoned; and about 207,000 acres in need of permanent revegetation.

These results reflect erosion conditions in the 1928-39 period. In many parts of the Washita watershed the conditions later became much more severe than the earlier figures reflect. Some of the land that was classified as suitable for cultivation, with protective measures, in 1938 has now been so damaged it is impracticable to cultivate it further. Such areas have also become sources of quicker runoff and increased production of sediment.

The survey party took into account, as well as possible, the estimated benefits that

would result from the spending of public money to correct these conditions, and these were most encouraging. The estimates, based on 1938 price levels, were as follows.

Benefits to farmers and ranchers, approximately \$5,000,000 annually; and reduction in flood damage, \$357,000 annually.

For each dollar invested, the estimated overall benefits were put at \$3.85.

By 1948 prices and costs, the damage to land and crops would be doubled or more. Benefits likewise would be increased greatly in dollar value. By any measurement, flood damages are costly and should be reduced as much and as rapidly as may be practicable.

WASHITA VALLEY IMPROVEMENT ASSOCIATION

About the time the flood-control report was being prepared, the citizens of the Washita Valley gathered at Chickasha and formed the Washita Valley Improvement Association. This organization announced that its purpose was to promote the improvement of the Washita Valley through flood control, soil conservation, and proper use of land and water. The objectives of this organization and its efforts to carry out these objectives are a tribute to the vision and the courage of the people of the Washita Valley.

SOIL-CONSERVATION DISTRICTS

Probably most of you here know how soil-conservation districts are organized, how quickly they have spread over the country, and how cooperatively and effectively the farmers in districts are going about their work. For the information of the others and to reemphasize again the responsibilities of the men who manage the affairs of these districts, I want to say that the districts, in my opinion, represent the foundation stones on which the soil-conservation program rests. These districts in most States are units of State government. The men who serve on the district boards here in Oklahoma are landowners who are chosen by ballot. The basis of this program is as democratic as it has been possible to make it, and that is the way it should be.

In setting out on this nation-wide districts program, the people of Oklahoma helped lead the way. Your legislature was quick to act in adopting the State soil-conservation district law and quick to start the first district in the Southwest in operation. That, I think, is typical of the way you people do things down here. You move in a straight line, and fast.

When the standard district law was submitted to the States in 1937, I would have been gratified indeed if 10 States had adopted it within 10 years. But all the States adopted it within less than 10 years. Now our Territories have adopted soil conservation district acts, and a number of foreign nations, too.

These districts, including those in your own Washita Valley Council of Soil Conservation Districts, cover more than a billion acres. They include almost two-thirds of the farmland and about three-fourths of the country's farms and ranches. Oklahoma is near the top of the list in district organization, with 93 percent of the State within the boundaries of 77 districts by May 1 this year. They include more than 33,000,000 acres of Oklahoma's approximately 36,000,000 acres of land in farms. Many of you here today are soil conservation district supervisors and know the solid foundation on which your districts have been built. You don't need for me to remind you of the liberal contributions of time and effort which enter into successful soil conservation district organization and direction, reflected in such concrete accomplishments as the Washita flood-control program which brings us together here today.

Such accomplishments, on the farms in the Washita Valley, throughout Oklahoma,

¹ Bennett, H. H., Soil Conservation, McGraw-Hill, 1939; Soil Conservation and Flood Control, pp. 506-616. See also Outdoor America, April, 1947, p. 8.

the Southwest, and the United States, speak for the success of this unique soil conservation district organization. It is too soon for the July 1 figures to be in, but I can tell you that during 1947, for example, farmers in soil conservation districts applied, with Soil Conservation Service assistance, an average of around 25 percent more conservation practices to their lands than during the preceding year. This progressive accomplishment was realized in spite of the fact that the Service had less technical help for districts and had to spread it among many more new districts. That explains why there were about 45,000 more applications filed by district farmers in 1947 for conservation surveys, planning, and treatment than new plans could be prepared, bringing the backlog on file to around 200,000 formal farmer requests for conservation plans. Of course, thousands of those have been serviced in the past 6 months, but added thousands of new applications have been made.

Up to January 1, this year, farmers and our technicians, working out in the fields together, had prepared throughout the Nation more than half a million completely coordinated conservation plans of whole farms and ranches in soil-conservation districts. These plans cover more than 160,000,000 acres, and the acreage on which conservation treatment had been applied totaled more than 76,000,000 acres in districts alone. In order to get a comprehensive idea of how we are progressing with the basic soil and water conservation job, we need to add the additional millions of acres planned and treated under other programs in which our Service has participated, plus the large acreage taken care of the first half of this year. In addition, nearly 270,000,000 acres of detailed conservation surveys had been completed by the first of the year—surveys which are necessary as a foundation for sound farm planning and treatment, just as flood-control surveys must precede actual operations.

The galloping rate at which Oklahoma farmers and ranchers are moving ahead with their soil-conservation work likewise is shown by the figures on accomplishments to January 1, this year. They showed about 34,500 active plans in the districts alone, with 7,750,000 acres planned and nearly 4,000,000 acres treated. I noted such items as these going to make up that healthy total of application of conservation measures on the land—1,250,000 acres of contour planting and a million acres of cover crops, close to 2,000,000 acres of stubble-mulching and 45,000 miles of terraces and diversions; more than 3,500,000 acres of conservation range stocking and 15,500 farm and ranch ponds; more than half a million acres of range and pasture seeding, and numerous other measures applied.

Together, in the right combinations suited to the capabilities of the land, these measures provide the only complete and lasting conservation of our productive land. I refer to the treatment of each acre according to its needs, and the use of every acre for the purpose to which it is properly suited. There is no substitute for this acre-by-acre soil and water conservation planning and treatment, no practical or economical short cut—no other way to do the job properly, scientifically, and most effectively.

And it is only by this means, in the long run, that we can be sure of permanently safeguarding the good land we have left before it is too late. If we had embarked on such a common-sense and foresighted program 50 or 100 years before we woke up to what was happening to our land, we wouldn't be faced with the situation we are today—of still shrinking productive land acreage at a time when our own and the world's population is increasing rapidly, with the end not yet in sight with respect to heavy drains on our land to meet world-wide food and other demands.

Soil Conservation and Flood Control— Part II

EXTENSION OF REMARKS

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following address by H. H. Bennett, Chief, United States Soil Conservation Service, Washita River watershed flood-control dedication celebration, near Cordell, Okla., July 8, 1948:

We have left, for example, only about 460,000,000 acres of high-grade cropland in the United States, as well as can be determined. But all but about 100,000,000 acres of it is subject to erosion or other forms of depreciation, when used without safeguards. And from 80,000,000 to 100,000,000 acres of it needs clearing, irrigation, drainage, or other improvements to make it productive.

Around a fourth of the cropland is being damaged at a critically rapid rate by erosion. Much of this approximately 115,000,000 acres will be permanently damaged and some of it ruined for further cultivation every year it is cropped without protection. It ought to be protected—and can be—with treatment like that which so many of you are carrying out in the Washita Valley, during the next 10 to 15 years, or not later than by about 1960. Still another area of cropland of about the same extent should, for the same reason, receive adequate protection by not later than about 1970. Additional millions of acres on which erosion is beginning or is likely to begin at any time must not be neglected, nor must we overlook the millions of acres of range land also affected.

You know, without my reciting figures for you, how your own Oklahoma lands have suffered, some of them in only half a century of agricultural use. I am convinced from what I have seen and from what I know in general about your soil-conservation progress out here that you are alert to the urgency of the situation. The job still ahead is such a big one, however, that you cannot afford to relax for a single season or for a single day in pushing ahead to its completion.

RETARDATION OF RUNOFF

At the outset I pointed out that our purpose today is to recognize an important milestone in our campaign against floods and erosion damage. I would like to emphasize the importance of this occasion. In this new treatment of agricultural land to assist in the control of surplus rainfall, we have started a new program. For the first time in history, we are going into the small watersheds, far upstream and out on tributaries of our main waterways, and there we are seeking to provide relief from floods to the small farmer or landowner who year after year has been undergoing hardships through crop and soil losses. Frequently, the accompanying flood damage along these upper "little waters" accounts for 75 percent of the total watershed flood damage. That gives you an idea of their importance. We have developed in this program a unique combination of soil-conservation, engineering, and forestry practices designed to safely dispose of surplus water and also to make the best practical use of the water that otherwise would be wasted.

Our main objective is to retard the discharge of water from upstream areas until it can be absorbed by the land or carried off without destructive effects. And while

we are thus retarding runoff, we are at the same time, and by the same means, reducing the effects of erosion; and we are storing in the soil for later use the water that may mean a good crop instead of a poor one or a failure. Also, we are, by the same operation, reducing the rate of sedimentation of stream channels, ditches, reservoirs, and productive bottomlands.

In our normal conservation work the objective has been to keep our agricultural lands permanently productive while in use. In our flood-control operations more emphasis is put on the task of slowing down runoff. For both purposes, we terrace sloping land, plow it on the contour, strip-crop it, fill gullies, take steep, highly erodible land out of cultivation and put it under the protection of trees or grass, and so on. Protection of waterways with grass, protection of land with stubble-mulch farming, and building up the fertility of the soil also aid both flood-control and soil-conservation operations. In doing these things, we are prescribing for our agricultural land the treatment that it needs to make it permanently and continually productive. We do this in much the same way that a doctor diagnoses the needs of a patient and seeks to restore him to the peak of health.

In watershed flood-control work we go considerably beyond the normal requirements of soil and water conservation. Our aim is to hold back for a longer time the water that falls on cropland or rangeland. So in this program we give special attention to measures, including engineering, that help to hold back water and slow down its flow.

Let us suppose that 50 to 80 percent of the landowners of a small watershed (such as this one) have treated their land with a coordinated soil-conservation program. They have terraced their farmlands and are tilling their fields on the contour. They have adopted soil-protecting and soil-improving rotations, and they are using all the other measures that their land needs for the maintenance of its productivity permanently. There still, however, would be damaging runoff and sediment loss (water-transported erosion material) from the area. The sediment mostly comes from the areas of unprotected land, treatment of some of which lies beyond the means of individuals or even groups of landowners. To retard this runoff and hold back the sediment may require special measures which may offer little benefit to the farmer on whose land they are built, but which are of great value to other farmers and residents downstream. Such measures are not often planned or applied in soil-conservation districts outside of flood-control project areas.

For example, we are now standing near the site of a small detention reservoir, designed by the flood-control technicians of the Soil Conservation Service working in cooperation with the local soil-conservation district. There will be many such reservoirs in the Washita project. Each is designed to impound water temporarily and release it at a rate which will not exceed the capacity of the channel below.

This reservoir is designed to provide enough storage capacity for the runoff from the heaviest rain that may fall over a 25-year period, or 900,000 gallons a minute. This reservoir was constructed to reduce this rate of discharge to 25,000 gallons a minute. This slower rate of runoff will continue for days instead of the whole reduction taking place in a few hours.

All the ordinary soil- and water-conservation measures, applied over this entire sub-watershed of 5,900 acres, probably would not accomplish this end in themselves. There would still be a need for a structure of this kind to keep runoff, after a heavy rain, low enough for the stream system to handle it without damage.

OTHER FLOOD-CONTROL TOOLS OF THE SOIL CONSERVATIONIST

In addition to the reservoirs, there are provisions for structures for waterway stabilization and gully control. Both contribute toward runoff retardation also. These include earth gully-plugs, drop-inlets, drop structures, and flumes. Such structures are designed not only to stabilize the grade of the waterway or gully, but to hold back sediment while the erosion above is being controlled through the establishment of vegetative protection. Many of these structures may not be needed for ordinary soil-conservation purposes.

Floodwater diversions are built to divert hill-land runoff and thereby prevent floodwater and sedimentation damage to highly productive bottomland. Flood-control waterways are used to carry hill-land runoff safely through cultivated areas, thereby preventing floodwater and sediment damage to productive cropland. They may serve as outlets for floodwater diversions or other flood-control structures.

In some places it may be necessary to straighten, clear, or enlarge the stream channel in order to reduce the frequency of flooding of adjacent cultivated land.

Cooperative roadside erosion control also contributes to the stabilization of roadside ditches, especially through proper shaping and by establishment of vegetative protection. This is an effective means of reducing the rate of sediment production. It also materially reduces the cost of road maintenance.

Revegetation of critical floodwater and sediment-source areas, such, for example, as critical slopes in fields, is another important tool in this program. There are many areas of land which have been so severely eroded that their usefulness for cultivation has been ruined. Where these areas are larger than a few acres, or are very numerous, it may be beyond the means of an individual farmer or a group of landowners to stabilize them. The revegetation of these areas, and the control of sediment produced by them while this is being accomplished, will be a public benefit in reducing sediment damage to lower-lying land, stream channels, ditches, and reservoirs.

Ordinary soil- and water-conservation measures are for the protection and improvement of the land on which they are applied, and consequently the principal benefit is received by the operator or owner of the farm on which such work is done. Therefore, it is only proper that the farmer should bear the principal cost.

On the other hand, the special measures and structures used in aid of flood control are designed to benefit bottomlands along the major tributaries and their branches and to keep sediment out of stream channels and reservoirs. Because these are public benefits, the public should bear the major part of the costs, so long as they are justified by the benefits to be expected.

This program of watershed improvement is good business, and I like to think of it in that way. When any of us invest our money in an enterprise, we want it to be a safe investment, and we want it to yield a reasonable rate of return. This program is good business for the farmers and the ranchers, and it is good business for the merchants and the professional men—everybody—in the communities involved. The measures used in this program fit in well with soil-conservation measures. Together these programs protect land, crops, livestock, and buildings. They aid in holding and building up soil fertility, often increase production, and make farming operations easier.

BENEFITS

I have mentioned the benefits that are considered when a flood-control program is planned. I will give some examples which have been passed on to me from some of our field technicians.

Below the two detention reservoirs on this Cloud Creek watershed are 179 acres of bottom land which will be protected directly by these dams. Protection of this land from flooding will mean that 11 acres now idle will be turned into irrigated cropland, 7 acres of pasture will become cropland (4 acres of it to be irrigated); 141 acres will remain in cropland and its productivity will be greatly increased; 5 acres will remain in pasture, and 15 acres of brushland can be cleared for pasture as needed. Conservatively, we estimate that the production from this 179 acres will be increased from 35 to 40 percent as a result of the installation of these measures.

In this particular watershed, in addition to the two detention dams, there will be six drop inlets, nine earth gully plugs, 3.7 miles of flood-control diversions, one-half mile of roadside waterways, and four soil flumes. You have observed that this work is nearly finished in this watershed.

When the combined flood-control and soil-conservation programs have been applied to the land in the watershed—more than 4,000 acres—I am confident that you will find the value of the land has been doubled, some of it tripled.

One of the farmers here, E. E. Weaver, tells our field men that he has tried alfalfa in one of these bottom-land fields year after year. Invariably it has flooded out. The man who farmed the place before him tells the same story. But now Mr. Weaver can grow alfalfa on his bottom land and it will not be destroyed by floodwaters.

Another farmer, Dave Merkey, estimates that this program will increase the value of his farm by from \$3,000 to \$4,000. Wheat on his bottom land produces 30 to 50 bushels an acre when it does not flood out. When the land overflows, he gets nothing.

There will be benefits from this work on below here, on South Cavalry Creek and on Main Cavalry Creek. I am told that there are 170 acres of bottom land on South Cavalry and 482 acres on Main Cavalry which this work will help protect. We call these secondary benefits.

Getting such a program as this on the land is only a part of the problem. Keeping it there, to yield benefits year after year, is likely to be more of a problem than getting the various practices installed. There is where the soil conservation district can perform one of its greatest services. And that is why it is as equally important to make a conservation farmer or a conservation rancher as it is to build a conservation farm or ranch. These flood control and soil-security investments must be protected. Such protection must come from the men and women who own and operate the farm and ranch lands. These individuals understand that land has strength and weakness in varying degree and that it must be used only according to its capacity to produce in lasting safety.

SOIL CONSERVATION PAYS

Fortunately, we know that soil conservation farming and ranching yields immediate benefits. We know that farm yields can be expected to go up a certain percent on the average, and that reaching benefits also will increase.

A study of soil conservation effects on 275 farms in the Upper Washita Soil Conservation District showed that, when the program of application was from 70 to 100 percent complete, the following per-acre increases in yields were reported: Grain sorghum 34, corn 29, cotton 21, and forage from grassland 18 percent. Cultivated land was reduced 5, and grazing land was increased by 6 percent.

In the Cross Timbers portion of the Washita watershed, the operation of 191 farmers on 38,827 acres of land was studied in the same way. The program of soil conservation on these farms meant 24 percent more cot-

ton, 22 percent more grain sorghum, 40 percent more corn, and 39 percent more forage in the pastures. Cropland was reduced by 14 percent; grazing land was increased by 30 percent. A total of 1,400 acres of idle land was put back to work.

So you can see that soil conservation is paying its way. Every farmer or rancher is a businessman. And as businessmen every one of them is ready and eager to realize more return from his work and his investment. The fact that in applying a program of soil conservation he is putting his agricultural plant on a sounder, more secure basis is a still further inducement to the owner and operator. It would be a small man indeed who would not find satisfaction in knowing that he was caring for his land in the way it ought to be cared for, and in knowing that, in addition, he was making possible the permanent use of his acres for generations to come.

PRODUCTIVE LAND AND HUNGER

Let's look for a moment beyond the limits of the Washita watershed and consider how this program affects others. It is my feeling—as I frequently repeat—that everybody is or ought to be concerned with the permanency of our productive land, because it is the source of our food, most of our clothing, all of our wood supplies, and of an increasing number of the raw products of industry. It is my conviction that of all the problems confronting the world today the toughest of them is how to feed a rapidly increasing population from a limited and diminishing supply of productive soil. Over a vast area of the earth's surface the population has surpassed or caught up with the food-producing possibilities of the land, or the number of people is moving rapidly in that direction. There are millions of people alive today who have never known and never will know what it is to have enough to eat. Year by year the number of hungry millions, because of present methods of food distribution and improper use and protection of the land, is likely to continue on the increase.

The stark truth is that we are running out of productive land. We are wasting it rapidly and unnecessarily. It is a grave indictment against our thoughtlessness in America that we have been using up, or destroying, what we had with such recklessness.

Hungry people are discontented people, quarrelsome, unneighborly. Hunger breeds lawlessness and strife wherever you find it. Hungry people cannot be happy, peaceful people, and the world is not likely to achieve permanent peace until its people can be properly fed.

That is my reason for saying that a long-range program of soil and water conservation is one of the greatest needs of our world. Never before in man's history has an acre of good land been so important as it is today. We have in the world today 4,000,000,000 acres of land that can be cultivated. It is not all good land. Some of it is of medium quality, or poor. But it must produce the food that 2,250,000,000 people need to sustain life. The number of people on earth is growing at the rate of about 20,000,000 annually. So the per capita acreage is growing smaller and smaller—while our population grows and our soil washes away.

Even here in the United States we are permitting the loss of our land at the rate of 500,000 acres a year, according to our measurements and estimates. This is in spite of the highly successful efforts that we already are putting forth to halt this waste. So you see how urgent and basic is this soil conservation task we face.

RESEARCH

Since 1920, the Department of Agriculture, in cooperation with the State experiment stations, has been conducting research in soil and water conservation as an aid to our action program on the land. Since 1934 the

Soil Conservation Service has been helping farmers and ranchers to apply soil and water conservation practices to the land. This work is being done now through the 2,000 soil conservation districts already organized, and it is accomplished by the farmers and ranchers themselves, along with the assistance given by technicians of the Soil Conservation Service working in the districts. During the fiscal year of 1947, the farmers and ranchers of this Nation applied soil conservation practices to 20,000,000 acres of land. This treatment included the use of all needed changes in land that we know about.

We have been making encouraging progress, but we still have far to go. About 85 percent of the land in the United States that still needs acre-by-acre conservation treatment—that is treatment according to the kind and capability of the land—is yet to be treated. That is a big job. It is a challenge to the men and women of the Nation.

In getting this huge job done, we have on our side some very effective weapons. We have a constantly growing understanding of the problem on the part of individuals and organizations in all segments of society—educational and religious, agricultural, commercial, and professional. We have the organization of soil conservation districts, set up by law to accomplish this specific task, and these districts are led by aggressive, intelligent local leaders who are going ahead with the job. We know how to do the job, and where the job is, and what it takes to get it done. We have scientific, practical, and economical techniques that come from 20 years of study and experience on the land. We have effective programs for every part of the Nation and for nearly every type of land. And, finally, we have in the Soil Conservation Service the first and by far the largest corps of trained, expert soil conservation technicians in the world.

Aligned against us are the forces of injured nature that have a long start on us, because of our heedlessness over the years. I am confident that we will win in this fight, just as we win in every fight in which our people are aroused. In this effort watershed treatment in aid of flood control has a big part. The structures that we are using in this program have been designed with engineering precision to do special jobs in holding back a part of the surplus water for a time. They are built at public cost, because the public shares in their benefits. They are devised to help protect life, agriculture, and property from damage, and investigation in the case of each structure has made certain that benefits will justify the cost. This is no hit-or-miss program. It has been carefully studied, carefully planned, and it is being executed with the same care and skill. We know that this program will accomplish what it is designed to do.

I think it is entirely fitting that we gather here today to recognize the contribution that this type of agricultural operation will make toward the continued prosperity and the security of the Washita Valley. This flood-water detention dam, and these other structures designed for flood-damage reduction are monuments to the vision and the faith of the men and women who live in this valley. You have fought long for this program. You have studied the means for its accomplishment, and you have worked hard for the things you are seeing here today. It is my earnest wish that this program here will be duplicated in many watersheds over the United States, so that the people of the Nation may enjoy the benefits of this new program which you of the Washita Valley in Oklahoma have so ably helped to inaugurate.

With your leave, I am going to join you in your rightful enjoyment of these prospective and deserved benefits. They are good for my soul, too; for this way lies security, good will among people, peace.

Educational Privileges to Veterans of the Korean War

EXTENSION OF REMARKS

OF

HON. OLIN E. TEAGUE

OF TEXAS

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 19, 1951

Mr. TEAGUE. Mr. Speaker, under leave to extend my remarks in the Record, I wish to include the statement I made before the Senate Committee on Labor and Public Welfare, Tuesday, September 18, during their consideration of S. 1940, a bill to grant educational privileges to veterans of the Korean war.

My statement follows:

Mr. Chairman, I appreciate the courtesy extended by your committee in permitting me to make a statement concerning S. 1940 pending before your committee.

I am chairman of the House select committee which has been engaged in investigation of the veterans' educational and training program for the past year. The committee is concluding its investigation of the educational phase of the Servicemen's Readjustment Act of 1944 and is in the process of preparing a final report. The comments which I will make regarding S. 1940 are made in the light of the experience gained by the committee in its year-long investigation.

As the present conflict continues and the armed services expand, it is apparent that a sizable number of veterans will be eligible for education and training under any new program. The abuses and shortcomings of the World II educational program are now apparent to us all. Now is the logical time for the Congress to consider the entire field of veterans' education and make such adjustments as are necessary and correct the mistakes of the past before extending educational benefits to future groups of veterans.

I am convinced that it will be necessary that an entire new law be written if the desirable features of the veterans' educational program are to be retained and the inefficiency, waste, and abuse which has plagued the World War II program is to be removed. My committee expects to approach the task from that standpoint and is preparing a draft of an entirely new bill which will suggest some fundamental changes to the present program. I believe that it is a hopeless task to amend and patch the present act in an effort to correct certain fundamental weaknesses which exist in the program.

S. 1940 proposes to extend the benefits of the present program to Korean veterans with a number of modifications. Some of these modifications appear desirable; yet others promise to bring about further administrative complexities. I do not believe that the Congress can make a major improvement in the veterans' program by amendatory legislation to the present act; however, I shall be guided in my comments by the draft bill under consideration and would like to discuss specifically certain points in the bill, as well as certain of its omissions.

The draft bill proposes to amend Public Law 2, Seventy-third Congress, as amended, by adding at the end thereof a new subsection Veterans Regulation No. 1 (a), as amended, would be further amended by adding at the end thereof a new part, known as part X.

The method of this legislation creates necessity for consideration of the basic authority of the Administrator of Veterans' Affairs. Constant controversy has resulted in the present program, since the unlimited

authority of the Administrator established by Public Law 2, Seventy-third Congress, as follows, "All decisions rendered by the Administrator of Veterans' Affairs under sections 701-703, 704, 705, 706, 707-715, 716-721, of this title and sections 30a, 485 of title 5 of the regulations issued pursuant thereto, shall be final and conclusive on all questions of law and fact and no other official or court of the United States shall have jurisdiction to review by mandamus or otherwise such decision," extended to all persons, parties, corporations, business concerns and educational institutions, whether public or private, profit or nonprofit, training veterans and rendering services under the Servicemen's Readjustment Act of 1944, as amended.

Presumably this all-inclusive authority was established by the Seventy-third Congress in order that the Administrator might be in a position to render a final decision on the hundreds of thousands of individual claims for disability compensation which originate under his jurisdiction. Since the Servicemen's Readjustment Act of 1944 amended Public Law 2, Seventy-third Congress, the sweeping authority of the Administrator was extended to all functions and transactions under the Servicemen's Readjustment Act of 1944. The Administrator was placed in a position of contracting with educational institutions and ruling on the finality of those contracts and was authorized to make final decisions concerning the legislative intent of the law, the meaning of regulations promulgated by him and any other questions which arose under the act. Educational institutions and individuals were precluded from judicial review and when the Administrator's authority was contested in court, the courts upheld his authority and ruled that they had no jurisdiction.

The unique authority enjoyed by the Administrator has been seriously questioned by a number of other congressional committees and Members of the Congress. The General Accounting Office has repeatedly called attention to the fact that decisions of the Administrator are not subject to their review and that the General Accounting Office is ineffective in dealing with the Veterans' Administration, since regardless of the merits of their case it can be resolved by an administrative decision by the Administrator which may or may not be based on legislative intent.

The House Committee on Expenditures in the Executive Departments, in its seventh interim report, published July 31, 1950, referred to the Administrator's authority with reference to the National Service Life Insurance Act as follows:

"Section 608 of the National Service Life Insurance Act stands out, among similar grants of authority by the Congress, as being the most absolute and the most definite in its finality.

"This subcommittee recommends that the Congress review the extent to which it has relinquished its control of public expenditures under the absolute authority granted the Administrator of Veterans' Affairs through section 608 of the National Service Life Insurance Act."

In its ninth interim report, the House Committee on Expenditures in the Executive Departments reported on its administrative studies of the Veterans' Administration leave policy and overpayments of subsistence in the Veterans' Administration. That committee again called attention to the unrestricted authority of the Administrator:

"The Comptroller General again has called attention to the unlimited authority which the Congress has bestowed upon the Administrator of Veterans' Affairs. These broad powers have prevented the Comptroller General from taking direct action with respect to expenditures resulting from the interpretations of the Veterans' Administration as herein reported."

This question has been repeatedly debated on the floor of the Senate and on October 12, 1949, Senator HUMPHREY commented on the attitude of the Veterans' Administration in exercising its unlimited authority and ignoring the intent of Congress. Senator HUMPHREY's statements were as follows:

"In other words, the bill, if enacted into law, will definitely prescribe certain regulations as to the amount of authority the Veterans' Administration has in promulgating regulations. Somebody might say, 'Why should we do this?' I will tell the Senate why. A conference report on an appropriations bill came to the floor of the Senate, and the Senate disagreed with certain language in the report. Thereafter the Senate Committee on Labor and Public Welfare held hearings in order to write the kind of language that would protect not only the veteran but the school and the Government. That language was carefully written. It was discussed with the Veterans' Administration. A proviso was placed in the appropriation bill which we thought in view of the hearings, in view of the constant conversation and talk we had had on the subject, would clarify this situation once and for all. But, Mr. President, despite the language, despite the hearings, despite the time devoted to this matter, and despite the complete understanding we had, the Veterans' Administration in instruction 1 (a) simply ignored what we had done and ignored the whole background and the legislative intent of the proviso which we incorporated."

During the same debate, Senator DOUGLAS made the following observations:

"Is not one of the great difficulties with our whole system of administration the fact that the various Government departments, instead of going to the Attorney General to obtain a legal opinion, have set up their own legal departments, with solicitors and lawyers in them, named by the heads of the departments, and then they ask their subordinates as to what they can do, and in nearly every case they receive opinions in support of what they contend to be their powers."

On the same subject, Senator CHAVEZ made the following statement:

"This law should be interpreted the way it was intended by Congress. As the Senator from Illinois [Mr. DOUGLAS] has so well pointed out, the reason the Veterans' Administration acts in the way it does is that the interpretation of the law comes from within the Administration. The law is interpreted by those who are working for the Veterans' Administration, and not by those who are interested in interpreting the law for the benefit of the ones whom Congress intended to benefit."

This matter again came up in the Senate on August 27, 1951, in connection with S. Res. 124, which the Senate was considering as a result of a failure by the Veterans' Administration to interpret Public Law 610 in accordance with its legislative intent. With reference to S. Res. 124, Senator HUMPHREY made the following statement:

"First of all we passed a specific bill on this subject, which was cosponsored, as I recall, by the senior Senator from Ohio [Mr. TAYLOR], and in the House by Representative TRAGUE, of Texas, I believe. The bill was passed unanimously and it was signed by the President. Despite that the Veterans' Administration counsel decided he knew more than the Congress, and continued to rule just as he had ruled previously. Then we had a conference report in connection with an appropriation bill, which spelled out the language we wanted, the legislative intent, and again the Veterans' Administration legal counsel said, 'We are right and the Congress is wrong.'"

"So what the resolution amounts to is a directive to the Veterans' Administration to administer the Servicemen's Readjustment Act, pertaining to its educational features as

the law is written, as the legislative intent of the Congress is written in the report and as it is found in the debates on the House and Senate floors. The resolution provides that the law shall be administered, notwithstanding the legal counsel, as it was intended to be administered by the Congress."

The Legislative Reference Service of the Library of Congress summarized the situation as follows:

"The requirements of the Federal Register Act are that the rules and regulations of the Veterans' Administration be published. Compulsion is absent, however, and lack of enforcement by judicial review may leave claimants in many cases without a remedy other than an appeal to Congress."

"While no specific exemption was afforded the Veterans' Administration in the Administrative Procedure Act, the saving of existing provisions of law precluding judicial review in most cases contributes to the situation whereby claimants must take their cases to Congress."

With reference to interpretations made by the Veterans' Administration of Public Law 610, Eighty-first Congress, the Legislative Reference Service made the following comments:

"I believe that Congress created wording commensurate with that intent in the enactment of section 2, Public Law 610, and that the Administrator can avoid his responsibility in effectuating that intent only on the basis of a technicality. . . . Acknowledging his power, I believe the Administrator has acted arbitrarily in this situation and that he should have issued instructions commensurate with the intent as expressed in the report, despite his protestation that 'If the Congress does not want me to do what I am doing they certainly have the right to change it.' When Congress indicates its disfavor of his administration of a program and enacts remedial legislation designed to effect a change the Administrator fails to effectuate this policy. This is indicative of the determination of the Administrator that he rather than the Congress shall establish policy and it further indicates a determination on his part to operate outside the purview of Public Law 610 if possible."

We have witnessed a situation of the Administrator of Veterans' Affairs interpreting the intent of Congress, entering into contracts with educational institutions and making all final decisions concerning questions which arise under these contracts. My committee has studied cases of repudiation of contracts, questionable interpretations made by the Veterans' Administration and regardless of the merits of the case the decision of the Administrator is final. It is obvious that some person or agency must be empowered with authority to administer the act and I do not disagree that it was perhaps wise that the Administrator be given final administrative authority in deciding individual pension claims. I do believe that we have a dangerous situation where an administrative officer of the Federal Government and in fact all employees under him enjoy the right to make a final administrative interpretation in their dealings with the educational institutions of this country and in many cases State agencies and State schools, under a law which precludes further judicial review. Before extending the educational benefits to additional groups of veterans I think that it is wise that the Congress thoroughly consider this question before continuing the Administrator's broad authority to make final determinations in connection with the veterans' educational program. I firmly believe that the new act should not amend Public Law No. 2, Seventy-third Congress, and continue the Administrator's broad and final authority, but should be a new and separate act defining specifically those areas in which the Administrator should have final authority and reserving the

right of judicial review in all instances not specifically covered by the act.

S. 1940 can be properly considered as a substantial extension of the present education and training program; however, a number of major modifications are proposed.

Section 1 proposes to restrict eligibility for training to any person who had passed his twenty-third birthday on June 27, 1950, or the date he entered service, whichever is later. Such a person would be eligible for 1 year of training. Persons under 23 years on June 27, 1950, or the date they entered service would be allowed eligibility for training up to 48 months. The Servicemen's Readjustment Act of 1944 originally contained a similar provision, however, in that case the age limitation was set at 25 years. The administrative complexities which grew out of this proviso caused the Congress to remove the restriction and authorize eligibility for training without regard to age limitation. Such a proviso becomes an administrative difficulty, since it is impossible to establish definite criteria by which to determine whether a person did actually interrupt his education or training to enter the Armed Forces. Obviously a person who was taken from college could prove that he interrupted his training. It might be more difficult for a young man who delayed entering college because he knew he would be required to serve in the Armed Forces to prove that his education was impeded by service in the Armed Forces. The veteran who planned no formal education, but who was attempting to learn a business on the job would probably never be able to convince the Veterans' Administration that he was in a training stage as a beginner on his job. I do not believe that such an age limitation should appear in the law. I believe that any new program should provide for some educational assistance, which together with a reasonable contribution on the veteran's part would allow the veteran to undertake education or training. I believe that a modest program making aid available to any veteran who wishes to help himself is more desirable than a more expensive program limited to a relatively small number of veterans whom the Veterans' Administration would administratively determine to be eligible for unlimited benefits.

Section 4, page 7, lines 17 through 22, provides that wherever there are established State apprenticeship agencies expressly charged by State laws to administer apprenticeship training, whenever possible the administrator shall utilize such existing facilities and service in training on the job when such training is of a year's duration or more. The requirement that apprenticeship agreements be utilized if training exceeds 1 year is a new criteria for determining whether the program should be an apprentice training program or on-the-job program. This requirement will have the effect of disqualifying on-the-job training programs in excess of 1 year which are not otherwise covered by apprenticeship agreements and will disturb the balance between organized apprentice training and other training on the job as it now exists.

Section 4, page 8, prohibits enrollment of a veteran in a profit school which has less than 25 equivalent full-time students or one-third of the equivalent full-time students enrolled (whichever is larger) paying all of their own tuition. This proviso in effect precludes enrollment of a veteran in any school which has less than 25 students. I agree with the apparent intent of the provision to require that veterans enroll in schools which have a substantial number of non-veterans; however, the wording of the paragraph excludes all small schools. Before World War II, a majority of the Nation's small privately owned schools, such as barbering schools, cosmetology schools, music and arts schools, and small business schools were 1- or 2-teacher schools with 25 students

or less. This proviso creates an artificial and unfair barrier to the small private school.

Section 5 requires that the veteran pay one-half of his tuition and requires that the Administrator pay the remaining half, not to exceed \$300. It is the apparent purpose of this provision to require the veteran to pay part of his tuition out of funds paid him for subsistence purposes in order that the veteran will have some interest in the quality and price of training which he receives. This objective is very desirable and should be one of the fundamental objectives of the new bill. I do not believe that this requirement will achieve its purpose in its entirety, since the amount which the veteran pays will be relatively small. The school and the Veterans' Administration will not be relieved of the administrative difficulties of preparing and processing vouchers, keeping records pertaining to the one-half paid by the Veterans' Administration. The educational institution will be faced with the additional problem of maintaining a separate account for the individual veteran, as well as the Veterans' Administration account. This additional obligation will represent a sizable burden in institutions of higher learning with thousands of veteran trainees.

I expect my committee to advocate a plan whereby a total payment is made to the veteran at the end of a month of training and the veteran makes direct payments to the school for tuition, books, fees, and other charges. Such a plan will eliminate the necessity for a contract and the necessity for the vouchers procedure and will make the veteran responsible for conduct of his own affairs. At the same time, it will create an incentive for the veteran to secure training at a reasonable price, since he will keep any funds which remain after his training bills have been paid.

The proviso of section 6, page 12, beginning at line 7, which requires that the veteran make a report of income for 12 months when he enters training and for each 12 months thereafter is not clear. The law does not indicate whether a total report of estimated earnings will be made, whether an average monthly report of estimated earnings will be made, or whether an estimate of each month's estimated earnings will be made. It appears that the Veterans' Administration will pay subsistence to a veteran enrolled in on-the-job training based on a 4-month adjustment plan, so long as the total of estimated earnings and subsistence do not exceed the ceilings specified on page 12.

Under the present program the veteran submits reports of actual earnings each 4 months and a projected estimate of the next 4 months' earnings at the same time. If by examining the report of earnings the Veterans' Administration determines that he received too much subsistence a recovery is made by the Veterans' Administration. Apparently, this section of the bill contemplates the payment of subsistence based on a projection of earnings and no effort will be made to later determine what the actual earnings were and make adjustments in case of an overpayment of subsistence. It appears that such a plan is merely legalizing overpayments, rather than establishing the administrative machinery necessary to cope with them. We have witnessed the action of the Veterans' Administration to legalize overpayments developed in connection with leave of absence in schools and it now appears that overpayments in on-the-job training would be legalized rather than collected if this proviso is to take effect.

Paragraph (b), page 12, line 22, establishes full-time training in a trade or technical course at 36 hours per week. The Congress has previously established full-time training in trades or technical courses at 30 hours a week and I have no reason to believe that 80 hours a week is incorrect. There is no

educational precedent upon which to base 36 hours per week training in trades and technical courses and I do not understand why the Veterans' Administration persists in suggesting 36 hours per week. The Service-men's Readjustment Act of 1944 was silent with regard to defining full-time training and the Veterans' Administration administratively determined full-time training in trades and technical courses to be not less than 25 clock hours per week. This definition remained in force for approximately 5 years and could have been changed at any time by the Administrator of Veterans' Affairs. However, in 1950 he recommended to the President, who in turn recommended to the Congress, that full-time training be established at 36 hours per week. The matter was considered at that time and was settled at 30 hours a week. For some unknown reason it again appears in this bill.

S. 1940 continues the requirements for agricultural training established by Public Law 377, Eightieth Congress. While Public Law 377 made provision for a trainee who performs his course as the employee of another, this part of the law has not been placed into effect except in a few States. In those States the program proved to be unsatisfactory and turned out to be a labor subsidy program for large farm and plantation owners and was in no way satisfactory. It is the general consensus of opinion among the State departments of education that this plan is not workable, therefore it should be removed from the law.

Paragraph (d), line 4, page 22, proposes to apply certain criteria to any school operated for profit. I believe that the basis of application for these criteria should be whether the school and the course is part of an accredited public school system or is recognized by an established accrediting association. If the school or course is not accredited it should be required to conform with these criteria regardless of whether it is public or private, profit or nonprofit. Certainly a proprietary nonprofit school should be required to comply with the criteria. The Congress should take this opportunity to further strengthen these criteria in certain areas where they have proven inadequate.

POINTS OF OMISSION

1. S. 1940 does not clarify the relationship and relative authority of the Veterans' Administration and the State approving agencies. This weakness was inherent in Public Law 346, Seventy-eighth Congress and has caused difficulty in the administration of the program. The authority to approve educational institutions as being qualified and equipped to train veterans was properly vested in the States. The Veterans' Administration is required to reimburse schools for services rendered in training veterans. Such a plan creates a joint Federal-State program. Public Law 346 did not clearly define the relative authority of the State and Federal Government and the obligations and responsibilities of the State approving agencies are not clearly outlined. The Administrator of Veterans' Affairs is precluded from interfering with the operation of a State approving agency or State educational institution and this restriction might be interpreted to mean that the Administrator cannot act so long as the school is approved, regardless of evidence of fraud or violation of the law. The new act for Korean veterans should clearly settle these issues.

2. I have mentioned previously the final authority of the Administrator to render decisions which are not subject to judicial review. This situation was partially corrected by Public Law 610, Eighty-first Congress, which amended Public Law 346 in that a Veterans' Education Appeals Board was established which could review tuition claims by schools and certain other acts of the Administrator and make a final administrative determination. S. 1940 does not extend

the authority of the Veterans' Education Appeals Board to the program proposed for Korean veterans.

3. S. 1940 proposes that the veteran will pay one-half of his own tuition from funds received directly by him from the Veterans' Administration and the Veterans' Administration will pay the remaining half. Apparently it is contemplated that the Veterans' Administration will negotiate a contract under which it will disburse one-half of the tuition received by the school. Reclaims for erroneous payments could be effected under this contract. In cases where veterans were overcharged or made erroneous payments of tuition and other charges from funds paid to them by the Veterans' Administration there appears to be no recourse, since S. 1940 does not establish authority for recovery of tuition payments illegally secured from veteran trainees.

4. Public Law 346 and S. 1940 are both silent regarding Veterans' Administration and State employees owning interest in private schools or receiving profits or payments from private schools which are under contract with the Veterans' Administration for the training of veteran trainees and which are under the direct supervision of State employees. S. 1940 does not propose to restrict a Veterans' Administration employee from leaving the Veterans' Administration and immediately becoming associated with a private school under contract with the Veterans' Administration. It has been a common practice under the present program for contract officers to establish a very favorable rate for a school and then leave the Veterans' Administration to take a job with the school at a much higher salary. The new law should prohibit ownership of private schools by Veterans' Administration and State employees and those employees should be prohibited from receiving payments, profits or gifts from such schools. Such employees should not be allowed to enter the employment of a private school under contract with the Veterans' Administration for a period of 1 year following termination of their employment with the Veterans' Administration.

5. The status of veterans having eligibility under Public Law 346, Seventy-eighth Congress and also accruing eligibility under the proposed program should be clarified. Current Veterans' Administration regulations provide that a veteran who initiated a course of training under Public Law 346 prior to July 25, 1951, and who was called into active military service prior to July 25, 1951, or the last date for his regular reentrance into training may re-enroll under Public Law 346, Seventy-eighth Congress, upon discharge from military service. No provision is made for the veteran of World War II who has been called to active military service during part of the period of his entitlement to enrollment under Public Law 346 and who had not initiated a course of training. This veteran should have the privilege of electing benefits under Public Law 346 or the new program and should have a period equivalent to the period of eligibility for training which he lost as a result of military service during which he could elect training under either program.

6. S. 1940 does not provide specific penalties for conspiracy and fraud by schools or veterans for acts of bad faith and gross misconduct in the use of his entitlement on the part of veterans. The new law should establish severe penalties for those schools and veterans who abuse the privileges established by the law.

In summary, I believe that any new act passed by the Congress should make the following provisions:

1. The program should be reoriented from a subsidized educational program to an educational assistance program. Entitlement to education should not be limited to those who can prove that they interrupted their education. A modest amount of aid should

be given any veteran who desires to help himself, rather than a large amount of aid to a limited number of veterans.

2. The program should be self-policing. It can be made so by requiring the veteran to make a contribution to his own training, rather than the Federal Government attempting to pay the total cost as it does under the present program.

3. The new act should prohibit the enrollment of a veteran in a school which does not have a substantial number of non-veterans and a school should be required to operate successfully for a period of 1 year prior to receiving approval.

4. The administration of the program should be simplified. This can be accomplished by eliminating the conception of fair and reasonable tuition rates and making the payment directly to the veteran at the end of the month of training. From this payment, the veteran will pay his own bills, thus eliminating the necessity for a contract and a vouchering procedure.

5. Supervision of schools and standards for approval should be strengthened.

6. Strict penalties for criminal acts should be established for criminal acts, the rights of a veteran who willfully misuses his entitlement should be withdrawn and Veterans' Administration and State officials should be prohibited from owning interest in a school under contract with the Veterans' Administration or becoming associated with such a school during a period of 1 year following termination of employment by the Veterans' Administration or the State approving agency.

7. The new act should provide for judicial review of decisions of the Administrator affecting educational institutions and State schools and agencies.

8. The relative authority of the Veterans' Administration and the State approving agencies should be clearly defined and the obligation of the State approval agency should be spelled out in the law.

Soil Conservation and National Security— Part I

EXTENSION OF REMARKS OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the Record, I include the following address by H. H. Bennett, Chief, United States Soil Conservation Service, tenth anniversary celebration Shenandoah Valley Soil Conservation District, Staunton, Va., August 23, 1950:

SOIL CONSERVATION AND NATIONAL SECURITY

It is stimulating and refreshing to come down from Washington at this time, when so many sober activities are occupying everybody's attention, to take part in this inspiring tenth anniversary celebration of the Shenandoah Valley Soil Conservation District. I wish everyone who is helping to shoulder our grave national responsibilities these days could have such an opportunity. I am sure it would further strengthen our common purpose and clear away any possible doubts in anybody's mind as to the direction our whole thinking and action must continue to take for the preservation and free growth of true democracy in a world split by conflicting ideologies.

When Chairman J. S. Cochran, Jr., of your board of supervisors, wrote inviting me down

here today, he reminded me that your district is situated in the heart of what you consider the garden spot of America—the valley of Virginia. It is a wonderful spot and that is the way to feel about it, even if many other spots in America are locally felt to be pretty good places.

PRODUCTIVE LAND AND MOBILIZATION

The one thing that is uppermost in everybody's mind today is mobilization of our manpower and economic resources for national security, come what may. As the President pointed out in his midyear economic report to Congress on July 26: "The productive strength of the American economy is basic to our domestic well-being and our international security." I couldn't help but think of the statement in your own State soil conservation districts act (and similar basic pronouncements in the districts laws of other States) that "the farming and grazing lands of the State of Virginia are among the basic assets of the State, and [that] the preservation of these lands is necessary to protect and promote the health, safety, and general welfare of its people."

Without a lasting agriculture, there can be no assurance of permanent prosperity, happiness, or peace anywhere on earth. And a prosperous and lasting agriculture depends on an adequate supply of productive land properly used and so protected from erosion that it will remain permanently productive. As long as people have enough productive land they can continue producing their food and fiber, and many of the raw materials of industry. If the land is neglected or unwisely used, the consequences will be national decline. That has been the tragic result in many of the world's older agricultural areas.

Lasting soil conservation of the kind you are putting into effect here in the Shenandoah Valley Soil Conservation District, with the technical assistance of the Soil Conservation Service, is mandatory everywhere. It is mandatory here in America, if our Nation—our civilization—is to avoid ever weakening while the enemies of our democracy multiply and gird themselves for new marches on democracy everywhere.

OUR WORLD LEADERSHIP RESTS ON THE LAND

None of us can say, of course, how long the present international emergency will last. Some people seem to think it will be short-lived. Let us fervently hope it will be. Then there are those who take the other extreme view, that we may just as well count on being in a continuing state of emergency, from the standpoint of defending our own and others' democratic life, for many years to come. We hope just as earnestly that such will not be the case; but, in any event, we certainly have to build and plan on the long-time basis against any eventuality. The United States definitely is in the position of world leadership, politically and economically, among the democracies, and naturally will be expected to retain that position with all the responsibility it involves. To do so, we must maintain our productive capacity, safeguarding our productive resources of land, water, timber, oil and other minerals, and so on, and using them wisely.

We must maintain, first of all, the productive capacity of our land—which produces all but a very small part of our food, all of our timber, leather, and wool, all of our vegetable fibers and oil, tobacco, and many other essentials. This we must do regardless of whether peace or war lies ahead. Right now, those responsible for our national security are thinking in terms of doubling our stockpiling of metals, drugs, and other raw materials. We cannot stockpile productive soil, in the sense of shipping it into this country from other countries. But we can and must safeguard our remaining productive land. This is an inseparable and essential part of our first line of national defense, because men with guns and

bullets can't fight without food, and there can be little food from poor land

CONSERVATION FOR PEACE OR WAR

Already, in the few short weeks since the Korean trouble started, threatened so-called surpluses of certain farm commodities have become comforting stores of essential food and fiber. When we have had repeated experiences of this nature, you wouldn't think anyone would be so foolish as to suggest that we sometimes don't need such things as soil conservation to help keep our agricultural producing plant in condition of top efficiency. Yet I am sure all of us have heard just such loose talk, both when there were a few extra bushels of wheat or other commodities in the granaries or when immediate demands for national defense or economic-aid programs have been pressing and properly of first consideration.

We have been told, for example, that we shouldn't spend money on soil conservation in periods of ample crop production because soil-conservation farming increases yields. If that illogical line of reasoning were carried to its ultimate conclusion, then we likewise wouldn't spend money on crop and livestock improvement, pest and disease control, or on any other agricultural research and improvement at such times. Instead, we would close down our State experiment stations, agricultural colleges, and the United States Department of Agriculture until such time as we might figure we needed their services again. The truth is that maximum per acre yields always are the basis of good agriculture, whether the market is up or down. Also, they mean the capacity of increased total production as may be needed.

Those who would have you abandon your conservation farming in wartime and other periods of maximum need for agricultural commodities are no less shortsighted. During World War II conservation farming demonstrated its effectiveness, year after year, in giving maximum production of needed crops, with minimum labor and machinery wear, and the most economical use of seed and fertilizer. Those are among the multiple benefits realized when the land is treated and used, acre by acre, according to its need and capability.

KEEPING OUR POWDER DRY

Meanwhile—and again keeping in mind the long-time need as opposed to short-sighted land exploitation for the sake of imagined expediency—the kind of practical, scientific conservation farming practiced in your own and more than 2,260 other soil conservation districts over the country builds up a sound reserve of productive capacity. It keeps our powder dry. It is true that during the last war a considerable amount of land damage resulted from cropping too much land that should have been left in grass. But, even including the plowing up of several million acres of hazardous lands in the drier areas of the Great Plains for growing wheat, the over-all damage certainly was nowhere near what it might have been had we gone through the war and postwar farm production strain without benefit of any conservation farming knowledge and practice.

Other millions of acres, moreover, were farmed the safe conservation way for maximum, profitable production; and this same land is in sound condition to give maximum production next year and the next, as the need may dictate. Examples of how this conservation principle works out were to be found this past spring in the spotted drought areas of the southern Great Plains. The trouble from wind erosion and dust storms this year was not, generally, in the old Dust Bowl of the 1930's because farmers there had turned largely to conservation farming in the intervening years. And, almost invariably, individual farms and fields under conservation treatment and operation in the 1950 drought areas suffered comparatively little land and crop damage, alongside untreated lands.

FLEXIBILITY OF CONSERVATION FARMING A SIGNIFICANT ADVANTAGE

The practical flexibility of conservation farming becomes of increasing significance as we look ahead and think about our national well-being and security. Assuming that we shall not forever be faced with international emergencies, we still have to think about better living for our own grown population. That is, enough of the right kind of food—including ample amounts of meat, dairy, and poultry products—for everybody, for our children and our children's children. From this stable, peacetime viewpoint, the importance of soil and water conservation again is self-apparent as the basis for sustained high-level production at relatively low cost.

The population of the United States already has passed the 150,000,000 mark, as shown by preliminary figures from the 1950 census. We have seated nearly 2,000,000 more people at the dinner tables of America every year for the last 10 years and 20,000,000 more each year for the world as a whole. Yet the supply of productive land from which to feed and clothe this steadily mounting number of people is sharply limited. Right here in the United States we have left only about 460,000,000 acres of good, productive cropland, including approximately 70,000,000 acres that would have to be cleared, irrigated, or drained before it could be cropped.

Although we are better off than most other countries with respect to the good land we have available—and infinitely better situated than some countries—we have no productive land to spare if we look forward to a permanent high standard of living and national security. Not with the future population trend continually pointing upward—to as high as 250,000,000 people in the United States in the next 25 to 50 years on the basis of recent past population growth.

The main forces operating to reduce both the area of productive cropland and the productivity of cropland are soil erosion, overcropping and leaching. Of these, soil erosion is by far the most dangerous and most widespread. Soil erosion is also the most damaging force affecting the Nation's range and pasture lands. On the other hand, the main forces operating to improve production from our croplands are soil and water conservation, improved plant varieties, insect and plant-disease control, and mechanization. Of these, soil and water conservation is by far the most important, for the reasons I have already explained. At this point, I think it might be well for us to stop and consider for a moment what we mean when we talk about modern soil conservation.

WHAT MODERN SOIL CONSERVATION IS

Modern soil conservation consists of the kind of sound land use and protection needed to keep the land permanently productive while in use.

It means contouring and terracing land that needs such treatment, and strip cropping and stubble mulching the land as needed, along with supporting practices of crop rotations, cover crops, green-manuring crops, etc., wherever needed. It means gully control, stabilizing water outlets, building farm ponds, locating farm roads and fences as nearly on the contour as practicable, planting steep, erodible land to grass or trees, development of good pastures and devoting good management to them after they have been developed.

Where land is too wet, modern soil conservation calls, moreover, for drainage, with full consideration given to wildlife needs. If it is too dry, it calls for irrigation; if subject to wind erosion, it calls for wind-stripping, tree planting, growing cover crops, and stubble-mulch farming. If plant nutrients, lime, and the humus supply of the soil have been depleted, it calls for fertilization and addition of lime and organic matter. If water-soluble salts have accumulated in toxic quantities—

alkali—as in parts of the West, it calls for both drainage and leaching out of the salts by flooding. And modern soil conservation calls also for the use of the best of the most adaptable varieties of crops as well as the most efficient of available adaptable tools.

Modern soil conservation likewise calls for flood control and reservoir protection (municipal and other kinds) by treatment of whole watersheds with the right combinations of practices, land use, and small structures in the smaller, upper watersheds where floodwaters start. Applied at the right time and place, such watershed treatment saves soil and reduces flood and sedimentation damage, stores water in the soil for plant use and, where conditions are favorable, in the underground strata for pumping. As a part of the modern soil conservation job, city sewage should be kept out of the streams and treated for use on the land, as some cities now are doing.

And, of course, an indispensable part of modern soil conservation is a supporting program of research, such as will provide for the welfare of the land at all times, and give farmers all the advantages that progressive science can contribute. Also, a continuing, vigorous program of soil-conservation education should be made a part of our teaching from kindergarten on through college. And, modern soil conservation calls for the maintenance of all effective work, that has a chance for permanency. Such measures are not intended to be used for just a single year or cropping season. They are the basis of land permanency, and that is necessary if we are to have a permanent agriculture.

ONLY ONE RIGHT WAY TO DO THE CONSERVATION JOB

A hundred years of farming experience in this country has proved definitely that no single practice, applied arbitrarily on a whole field or a farm, will control erosion and maintain soil productivity permanently, except perhaps the planting of an entire field or farm to grass or trees. And we can't live by grass and trees alone! Except where the land is used for grass or forest, single-practice soil conservation can't be successful in the great majority of cases, because it almost always is inadequate to cope with the diverse land conditions and complicated requirements of sound land use and protection, imposed by nature. Some single practices, such as contouring, stubble mulching, rotation, or manuring will bring some temporary benefits to entire fields or farms; but they cannot get the job done on anything approximating a permanent basis, except on the relatively small areas of the very best quality land (land of capability class I).

No, there is only one correct formula for doing the soil and water conservation job right—regardless of what anybody may try to tell you. That formula consists of treating the different kinds of land on a farm according to their individual needs as determined by condition, and using each kind according to its capability for continued safe and economical production—whether that be for field crops, pasture, timber, or wildlife.

PROGRESS IN SOIL CONSERVATION DISTRICTS

That is the kind of conservation farming you have been putting into effect with success and satisfaction here in the Shenandoah Valley Soil Conservation District for the last 10 years. It is the kind of conservation farming that is safeguarding and improving our country's farm and ranch lands at a progressively increasing rate each year. In 1942, to illustrate, the Soil Conservation Service assisted the districts in completing only 1 percent of the unfinished part of the Nation-wide soil conservation job; but in 1949 the annual rate of progress went up to 3.4 percent of the unfinished job. We finished the job on 5,000,000 acres in 1942 and on 22,000,000 acres last year.

This was an increase of 340 percent, but we had an increase in facilities of only 43 percent.

Soil Conservation and National Security— Part II

EXTENSION OF REMARKS OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend by remarks in the RECORD, I include the following address by H. H. Bennett, Chief, United States Soil Conservation Service, tenth anniversary celebration, Shenandoah Valley Soil Conservation District, Staunton, Va., August 23, 1950:

Your Shenandoah Valley district has been in operation for 10 years. The first soil conservation district anywhere came into being only 13 years ago this month, in my home county of Anson County, N. C. When we reflect on this comparatively short time that these districts have been at the job, I think the progress that has been made—both from the standpoint of district organization and soil- and water-conservation work actually done on the land in the districts—is nothing short of remarkable. Do you realize that, as of July 1, this year, the districts covered 1,250,000,000 acres in the 48 States, Alaska, and Hawaii, Puerto Rico, and the Virgin Islands, and included 4,750,000 farms? In fact, 80 percent of all our farms are now within soil conservation district boundaries, as is three-fourths of the land in farms of the United States.

WE ARE MOVING AHEAD FASTER EVERY YEAR

Your districts' accomplishments in getting soil and water conservation on the land likewise are something to be proud of, especially when we keep in mind that the kind of conservation you are applying is carefully planned, acre-by-acre conservation which has been put on the land to stay. Final figures for the last fiscal year (to July 1, 1950) have not been checked yet, but conservation preliminary figures show the following for the past year's district work done, and the total to date. How we have increased again the yearly rate of conservation surveying, planning, and treatment is apparent from these figures:

[Approximate totals]

	Fiscal year 1950	Fiscal year 1949	Cumulative to July 1, 1950
Detailed conservation surveys	30,000,000	25,800,000	337,000,000
Complete farm plans—number	130,000	115,000	870,000
Acres planted.....	36,000,000	32,280,000	240,000,000
Acres treated.....	26,000,000	22,000,000	125,000,000

The record of soil-conservation-district accomplishments here in Virginia likewise is good, in the Shenandoah Valley District and elsewhere. But as I don't have even the preliminary fiscal year figures for the State, I shall not undertake to review for you the facts on your own work with which you already are more familiar than I am anyway.

THE DISTRICT AND PRACTICAL DEMOCRACY

All of these figures are most satisfying, of course; because they show the steady

progress we have been making, in Virginia and throughout the country, in getting the vital soil- and water-conservation job done. But, over and above the tangible physical accomplishments we can add up on an adding machine, there is another contribution which your soil-conservation districts are making to the national welfare and security that simply can't be measured by slide rule or calculator. I am referring to the soil-conservation districts as living, working forces of practical democracy in action.

Now this may sound to some of you like a bit of high-flown theorizing that is pretty far afield from the actual conservation job with which we are concerned. But, actually, this local, democratic philosophy underlying the districts is basic to the whole concept of sound and economical soil and water conservation. In the early days of our national soil-conservation program, it soon became apparent that the Government as such never could hope to get the job done through limited Federal efforts alone. That is why the soil-conservation-district idea was conceived, to insure that full opportunity and responsibility for conduct of a system of agriculture of such magnitude and importance be lodged with the landholders where it belongs, and with no strings attached.

And that is exactly how it has worked out, with most gratifying results. Certainly the soil-conservation-district movement is the greatest land movement in all history. Your district organization, as it has stood the test of 13 years of peacetime and wartime experience under just about all possible conditions, definitely has proved itself to be superior to anything else we know anything about in coping with our basic land problems in a democratic fashion. Your districts are farmer-voted and farmer-managed. Between 11,000 and 12,000 soil-conservation district supervisors are giving unselfishly of their time and energies in the furtherance of soil-conservation work throughout the country. They are on nobody's payroll, and are obligated to no Federal or other outside authority.

THE CONTRAST IN NONDEMOCRATIC NATIONS

In order to appreciate what this kind of democratic leadership means in the Nation's basic agricultural economy—really means in terms of what we mobilize and fight for when pressed to it by others—you need only to study the contrasting situation in so many other countries, where what the government says is law, with little or no opportunity for individual freedom of action, assurance of stability, or hope of security. I have observed these things in different parts of the world myself, and, of course, we read about them every day. Only recently, for example, I read an enlightening discussion of the land situation in Soviet Russia, in which that country's relatively limited amount of land that could be made to produce economically for its big population was emphasized.¹ But what struck me most was this statement:

"Despite Soviet propaganda about tractors on farms, Russian agriculture is moving toward the Chinese level of exploiting manpower rather than toward the American level of using horse-tractor power. In line with this is the report that Mao, China's Communist chief, has promised Stalin 5,000,000 of his surplus men for farm work. They would fit naturally into communism's expanding man-pulls-plow paradise. But neither Stalin nor Mao can make it rain. That being true, Russia with a mounting population and a static farm output, has no safe food margin, and could be acutely endangered by another series of dry years."

We can be eternally grateful that we have no man-pulls-plow economy in America.

We never did have, and never will have so long as we maintain our productive land and other resources in healthy condition to defend our individual freedom and national democracy against the assaults of communism or any other weird isms. Rather, we enjoy an economy in which even less and less horseflesh is hitched to our plows, as machines take over draft and other heavy tasks. It is an economy that depends on individual freedom and initiative, and the exercise of individual responsibility.

SOIL-CONSERVATION-DISTRICT METHOD IS BEST

The soil-conservation-district method of farming is the best approach we know about for encouraging the intelligent exercise of those prerogatives in the conduct of the Nation's biggest business of agriculture. This fact has been demonstrated beyond any question in the 13 years of district operation by the scores of thousands of soil-conservation-district landowners and operators like those of you in the Shenandoah Valley district.

I also am convinced that the district method would be the best approach that farmers of the world everywhere could take for getting to the point where they have more voice in the affairs of their government and less discontent with the overlords. Bona fide soil-conservation districts are in operation as going programs in several other countries—as the philosophy of conservation spreads faster world-wide.

SATISFACTION AND SECURITY IN CONSERVATION FARMING

Soil-conservation districts bring farmers together in moving ahead with sound conservation treatment of the land. The district provides a recognized central point for carrying forward effective conservation work.

Also, when the farmer has a sound plan for conservation operations for a period of years ahead, as he does have as a soil-conservation-district cooperator, not only is he likely to do a better job of farming, but he has the satisfaction of knowing that his efforts will increase his security, in the face of whatever international or other unfortunate incidents the Nation may have to pass through. That is what makes the democracy we fight for, the more secure the individual, the more secure the community and the Nation. It gives the farmer pride and satisfaction to be able to look forward to the future security of his family. His farm, under sound conservation management, gets better all the time instead of worse. He sees that he is going to be able to pass his land on to his children in better condition than it was when he began farming it.

THE PROFITABLENESS OF SOIL CONSERVATION

Certainly not least among the benefits of soil-conservation farming to be considered when we think of national welfare and security is its profitability. This kind of farming has been shown consistently to raise the individual landholder's income through more economical operations and greater per acre returns. This, in turn, is reflected in better business in town where the conservation farmer trades. And we also know that revenues to local, State, and Federal governments are increased proportionately from such higher farmer earnings—revenues which pay for, among other things, jet bombers and bazookas. I could make an entire speech on this significant aspect of soil and water conservation, because the individual examples and other reported figures supporting these facts are too numerous even to be counted.

FLOOD CONTROL AMONG IMPORTANT PUBLIC BENEFITS

The public benefits of soil and water conservation—which in turn impose public responsibility for helping to do the job—are many. There is the matter of flood control, to mention one which I know is of interest to you, and of reducing reservoir siltation

and stabilizing ground water and our other water supplies. Everybody here, I am sure, is familiar with the effective emergency flood-control job that was done down this way after the June 1929 flood damage that occurred on North River and Briery Branch. The work that was done—and which could not have been done so efficiently and economically had it not been for the quick response and cooperation of the local district landowners and others involved—was outstanding. I know nobody would discount the public value of this work of restoring the stream channels by removing the thousands of tons of debris and thus protecting your valuable bottom lands against damage from future freshets.

Meanwhile, as you are aware, the important long-time Potomac watershed-treatment program, including the Shenandoah watershed, is going forward steadily, with the Soil Conservation Service working with your soil-conservation districts on farmlands and the Forest Service doing the fire protection and cover protection work in the national forests of the watershed. I hardly need to emphasize to this audience the high importance of all such water conservation and management undertakings to local, State, and national well-being and security.

Such are the compelling reasons why we must push ahead as fast as we can, without sacrificing the lasting quality of the work we do, with our tremendous soil and water conservation job. As I said at the beginning, we don't know how long we may be faced with emergency conditions—possibly only a few weeks or months, maybe 25 years. But we do know that, emergency or no emergency, we are determined to go forward as a democratic American people, enjoying the highest standards of living as may attain and keeping our national security intact at all times.

SOME MISCONCEPTIONS TO GUARD AGAINST

Your soil-conservation districts have an important responsibility in all this. There is much we need to be thinking about, talking about, and doing something about to reach and hold our objectives. We have been making splendid progress in soil and water conservation, but the major part of the basic job is yet to be done. Especially do we need to be on guard against and work to dispel certain misconceptions, or loose assertions, about soil conservation that still seem to confuse the thinking of some otherwise well informed people. Briefly stated, some of these are:

1 That soil conservation is of secondary importance, has already been taken care of, or can be postponed.

2 That there are short cuts to conservation, that farmers can do all the necessary conservation work without technical assistance, or that farm plans are too technical for farmers.

3 That soil conservation costs more than it is worth.

4 That we have all the good land we need, and that soil erosion is an inevitable part of nature's scheme.

TEAMWORK FOR A CONSERVATION PROGRAM OF POSITIVE ACTION

The job we have to do calls for the closest teamwork of all interests in our society: farmers, business, and professional people; private and public financial institutions; magazines, newspapers, radio, and television; chambers of commerce, sportsmen's, women's, young people's, and other groups, schools and churches, local, State, and Federal agriculture, forestry, and other agencies and farm organizations—everybody. I know all these interests are working together here in the Shenandoah Valley District, as they are in districts all over the country.

To complete the soil- and water-conservation job in time calls for a program of positive action, in which all such groups have a natural interest. It includes, among other points: (1) Completion of the national land

¹ Russia's Parched Land Drives Her to Aggression, Randolph Leigh, Washington Sunday Star, July 30, 1950.

capability inventory at the earliest date facilities will permit; (2) completion of the organization of the Nation's agricultural lands into soil-conservation districts and strengthening district responsibility and work—with a scientifically developed soil-conservation-district plan applied by a conservation farmer to every farm in the country at minimum public cost; (3) active participation of all interested rural and urban groups—business, professional, and patriotic—in achieving Nation-wide conservation; and (4) making a real conservationist of every farmer in the country.

Conservation of our productive land, water, timber, wildlife, and other indispensable natural resources is not a matter which is of interest only to our own generation. It is the foremost factor on which hinges the very survival of all the generation to come after us. We must, through education in the schools and everywhere else, establish the conservation concept so firmly in our national consciousness that it never can be uprooted—so that, a hundred years from now, conservation will be practiced universally.

The safeguarding and perpetual wise use of these life-supporting resources is the only insurance we can have of continued national security for our free people in free America.

Slaughter Quotas on the Meat Industry

EXTENSION OF REMARKS OF

HON. ANDREW F. SCHOEPP

OF KANSAS

IN THE SENATE OF THE UNITED STATES

Thursday, September 27, 1951

Mr. SCHOEPP. Mr. President, during last week's hearings on the question of whether or not to impose slaughter quotas on the meat industry, we heard some convincing arguments against such a regulation. At this time I ask unanimous consent to have printed in the Appendix of the Record the statement made by Mr. Everett C. Seal, of East Falls Church, Va., before the Committee on Banking and Currency on September 17, 1951.

There being no objection, the statement was ordered to be printed in the Record, as follows:

STATEMENT OF EVERETT C. SEAL BEFORE THE
SENATE BANKING AND CURRENCY COMMITTEE,
SEPTEMBER 18, 1951

My name is Everett C. Seal. I am a partner with Mr. T. M. Brown, trading under the name of Brown's Meat Market, located at 6856 Lee Highway, East Falls Church, Va. We are a small, independent business. Both Mr. Brown and I are World War II veterans and have had many years experience in the meat business. Brown's Meat Market was at one time under the sole proprietorship of Mr. T. C. Brown, the father of Mr. T. M. Brown. Prior to my entry into the military service in May 1941, I had been employed for 13 years by Mr. T. C. Brown.

The store on Lee Highway is our only retail outlet. We do not wholesale meat. We have a slaughtering house in Luray, Va., where, before quotas were imposed, we were able to slaughter all the beef we needed to satisfy our growing business. We have been planning to expand our slaughtering facilities at Luray for 2 years, so that we will be able to meet all our customers' needs without buying from the big packers. This expansion is now under way.

I have gone into the details of our operation so that there will be no doubt in the minds of any of the committee as to how we operate and whom I represent. I am appearing solely as a representative of Brown's Meat Market, and in the hope that I may be able to present to the committee some facts that they otherwise might not have as to how slaughtering quotas have affected a small independent business, and how they will affect us if they are imposed on us again.

Our business is located near the Arlington County-Fairfax County line. The community of Falls Church, and the part of the two counties near us has shown considerable growth during the past 10 years, and particularly during the past 2 or 3 years. In 1940 the population of Falls Church, according to the census figures, was 2,576. In 1950 the same figures showed an increase of 4,959, or a total population of 7,535. Therefore, our population has almost tripled in the last 10 years.

The same thing, to a lesser degree, is true of Arlington County and Fairfax County. The census figures show the population of these two counties has increased almost two and one-half times in the past 10 years. In the last year, these two counties have increased by about 25,000 people. There isn't any doubt that this condition will continue. These counties issued a total of 8,000 building permits during 1950, and some of these dwellings are just now being occupied.

This population growth has of course increased our business. In 1949 we killed 199,050 pounds live weight of beef. In 1950 that figure was 225,297 pounds, an increase of over 25,000 pounds. During the first quarter of 1951, our figures again rose over the same period for 1950. In the first quarter of 1950 we slaughtered 54,605 pounds live weight. For the same period in 1951, the figure was 86,470 pounds. I am giving the committee these figures to show that our growth has been normal, due to the increased population, and due to the fact that we have always tried to give quality at the lowest possible price. I will point out how quotas hamper us in this in a few minutes.

On March 31, 1951, I received word that we would start operating under a slaughtering quota. Our quota for the month of April was fixed at 100 percent of our live weight slaughtered in April 1950. This amounted to 16 head of cattle. Since this figure was far below what our normal slaughtering had become, I immediately went to Richmond, Va., and talked to Mr. Andrew J. Francis, who, at that time, was in charge of the Meat and Livestock Division of the OPS there. He told me to submit a letter stating my case, which I did. I have attached this letter to my statement as exhibit I. I told Mr. Francis in my letter that we were slaughtering at a rate of about 32 head per month and that we did not believe 16 head would be adequate to meet the needs of our customers.

Mr. Francis also suggested I go to Washington, D. C., and see Mr. Don Leach, of the OPS, with a copy of the letter I had written him. Mr. Leach was most courteous. However, he could not give me any encouragement. It was suggested in Mr. Leach's office that I fill in with packers' beef, and as I stated then this would not be satisfactory because up until this time we had been able to kill all the meat that we needed. I presumed that the packers were operating under the quota same as the small independent slaughterers and would not have extra meat available. Furthermore, we had managed, due to volume, certain operating economies, and the fact that our personnel were trained in all aspects of our business, to keep our price on most cuts about one-third below chain stores. If we bought packers' beef, we would not have been able to sell at that low a price.

Mr. Leach also requested the dimensions of our slaughtering facilities which are located in Luray, Va. On April 4, 1951, I wrote a letter which gave all the information he required. Some time later in April, I visited the offices of Senator HARRY F. BYRD, of Virginia, to see if I could get any assistance in getting relief from the OPS, and Senator BYRD kindly wrote a letter, on April 25, in our behalf to Price Administrator DiSalle.

On May 1, we received notice from the OPS that our slaughtering quota for the month of May would be 90 percent of our livestock slaughtering for May 1950, and on May 4, I received a letter from Mr. John A. Lennartson, acting head of the adjustment section of the Livestock and Meat Distribution Branch of OPS denying our application for relief on the grounds that relief to us would not be consistent with the objectives and principles of their program. I have attached that letter as exhibit II to my statement.

My partner and I decided it would be best to fill in with packers' beef, providing it was available, in order that our customers would not find empty showcases and refrigerators 1 and 2 days a week when they came in to make their purchases; also, to try to hold our customers for the future, as we felt that this was only a temporary measure and by having beef available for our customers in a legitimate store at legitimate prices, we were keeping down black market in our community.

We were able to buy some dressed beef from a few of the larger packers. There is still a question in my mind as to how the larger packers were able to furnish this extra beef when all quotas were supposed to be based on 1950 business. The most satisfactory method of obtaining beef for our customers, however, was to buy and slaughter it ourselves, so I wrote Mr. Francis on May 10, asking him to reconsider our case. That letter is attached as exhibit III. I pointed out in the letter that the OPS, by forcing small independent slaughterers to buy packers' beef was going to force prices up. It seems to me that this is exactly the opposite result from that intended by the Congress in setting up the OPS.

On May 10 Mr. DiSalle wrote Senator BYRD in answer to the Senator's letter of April 25 on our behalf. His letter merely reaffirmed the decision of which Mr. Lennartson had already written me, but Mr. DiSalle recognized the problem brought on by the tremendous population increase in northern Virginia, to which I have already referred. I have attached Mr. DiSalle's letter as exhibit IV.

Finally, on May 19, I received a letter from a Mr. Clarence P. Moore from the OPS regional office at Richmond, Va. This letter, which I have attached as exhibit V, was in answer to my letter of May 10. It again denied our application for relief, and stated that "it seems very important that meat distribution be confined to the same channels as existed during 1950." I hope I have succeeded in showing the committee that this is the exact result that we were trying to achieve by having our quotas raised. By being forced to operate at approximately one-half our normal volume, we were obviously disappointing one-half of our customers. It seemed to us that the quota system, as applied in our particular case, would encourage customers who were unable to buy beef from us or our competitors to turn to black-market supply.

I would like to turn now to the effect this quota system had on our business during the time it was in effect. I have already pointed out that we showed a good increase in live weight slaughtered during the first quarter of 1951 as compared with the first quarter of 1950. During the 4 months of 1941 while quotas were imposed—that is, from April 1 through July 31, we slaughtered

66,736 pounds, which was 8,000 pounds less than we slaughtered during the same 4 months for 1950, and was 20,000 pounds less than we slaughtered during the first 3 months of 1951.

We bought 23,614 pounds of dressed beef from big packers during April, May, June, and July of 1951. Presuming this beef would dress an average of 59 percent this would give us a total live weight of 40,023 pounds. By adding this figure to what we were allowed to kill under the quota system, we get a total of 106,759 pounds, or about 32,000 pounds over the 1950 figures. This shows that our rate of slaughtering would have been about the same as during the first quarter of 1951.

As I have already pointed out, being forced to buy beef from the big packers could only result in pushing our prices up, and when the price ceilings were revised in May, we were forced to raise our beef prices about 6 cents per pound. I am glad to report that I believe we will be able to lower our prices on beef within the next 30 days, providing we can still operate as we have been doing for the past month.

There is another disadvantage to being forced to buy from big packers, and I am sure those of the committee who are experienced in the beef business are familiar with it. It is not easy to buy only one species of animal from packers' salesmen. The packers are not interested in selling beef to new customers unless they are able also to sell their other products.

As I have already stated, we are seeking to expand our facilities so that we will be able to offer a full line of our own products. At the present time, for instance, we rely on the big packers for some of our sausage products and smoked meats. When we have our new facilities at Luray, we will not have to do this. Obviously, with our business cut to one-half of what it should have been, we were hesitant about going ahead with our expansion plans. This brings me to another example of what the small independent retailer faces in dealing with the big packers.

Just prior to May 30, I ordered smoked hams from one of the big eastern packers, at their quoted price of 61 cents per pound wholesale. The very next day one of the larger chain stores in the Washington area advertised the same ham, in one-half or whole, for 59 cents per pound retail. In order to compete with that price we would have been compelled to lose 2 cents per pound. It certainly seems to us that quotas tend to destroy the ability of the small-business man to take care of himself in a competitive market. I should add here that, in normal times, we are not too concerned about the competition from the chain stores in the Washington area. We find that most people prefer having their meat cut on the counter before them, so that they can see what they are getting, rather than buying meat already packaged from a self-service bin. We believe that there will always be a majority of people who prefer personal service in a butcher shop.

There is one further and very important example of how quotas operate to encourage monopolies in slaughtering. Normally, a business such as ours can give a good account of itself at a stock sale. Our buyer is well experienced, and, in my opinion, he is one of the best in the business. For example, I recall that he bought a beef from under the noses of the big packers' buyers at 28 cents a pound on the hoof. Dressed down the animal graded choice. It is through experience of this sort that the small slaughterer can hold his own against big packers.

Under the slaughtering quota system, however, the situation is drastically changed. We buy in competition with Armour, Swift, and other big packers. They are given a Nation-wide quota and may pick and choose stock sales across the country. They can buy in markets where beef is

plentiful, and can stay out of markets where beef is in short supply. On the other hand, we are restricted, because of our size, to a very few markets within a 80-mile radius of Luray. This means that the big packer, by shifting his quotas from region to region, can always get a price advantage over the small operator. Unless we absorb this difference somewhere along the line, it must be reflected in the retail price on our counters.

I have already given the committee the important correspondence I have had with OPS, but the record would not be complete without listing my final two communications. I do not know whether Mr. Moore's conscience bothered him about our case, but in any event on September 12, after I had requested to be heard by this committee, I received a letter from Mr. Moore. This letter advised me that they still had my application for relief but would not act on it due to the fact that the quota system was forbidden by law. He assured me, however, that he would be glad to take it up again if and when the quota system came back in. That letter is exhibit VI to this statement.

Last Saturday, the regional office at Richmond apparently intended to send me some further bulletin, for I received an empty sealed envelope on that day. I assume that I will hear again from the regional office asking why I have not responded to some form or other that they intended to send me.

I firmly believe that if the legitimate slaughterers will be allowed to operate without the restriction of the quota being imposed upon them there will be plenty of meat available and no need for the American housewife to have to buy from the black market. But if the quota is restored, I personally feel that you will see black-market stores being operated around the corner because it will create a shortage, as I have found from previous experience.

I would like to state how well our business has operated during the past 30 days without having to operate under the quota. We have been able to have plenty of meat for all our customers and are now able to continue selling choice porterhouse steaks at \$3.37 per pound less than OPS ceiling price.

As a small independent slaughterer, I would like to suggest that in order to keep down black market you allow all licensed slaughterers to operate without a quota. And I feel that if the OPS would stop keeping such a close watch on the legitimate slaughterers and keep a closer watch on the illegitimate slaughterers that would help too. Instead of having legitimate slaughterers fill out a lot of forms to be sent in each month, OPS should require the stock yards at which place the cattle are sold in each State to send in a report on who is buying the cattle. If any of the buyers listed are not licensed to slaughter, these are the slaughterers for the black market and should be prosecuted. Also you would be able to tell who is paying over ceiling price in the stock yards for the cattle. By doing this I am sure that you will find that you can keep the meat in the proper channels.

After hearing my testimony I hope that the committee will agree with the small independent slaughterer when he says that by imposing the slaughtering quota it will be creating black market and a monopoly for the large packers.

I appreciate the opportunity of appearing before this committee.

EXHIBIT I

BROWN'S MEAT MARKET,
East Falls Church, Va., April 2, 1951.

Re RR-F.

Mr. ANDREW J. FRANCIS,
Meat and Livestock Division,
Office of Price Stabilization,
Richmond, Va.

DEAR MR. FRANCIS: I am writing you in connection with my visit to your office this

morning regarding relief in our slaughtering quota.

The reason I am asking for relief is because of the increase in our business this year over last year which has been brought about in a large degree to the increase in population mainly due to service personnel being moved into the Washington metropolitan area.

Our quota for the month of April, according to last year's slaughtering record, is 16 cattle or 13,795 pounds. Since January 1 of this year we have slaughtered around 32 cattle a month, or approximately 28,000 pounds per month.

Our business is run on an honest basis and is open to inspection at any time.

My partner, T. M. Brown, and I are both World War II veterans and have worked hard since our discharge from the service to make our business what it is today.

In order to keep our present customers satisfied and hold our business for the future, we are asking you if there is any way our quota can be increased accordingly.

Thank you for your interest and attention to this matter.

Very truly yours,

EVERETT C. SEAL.

EXHIBIT II

OFFICE OF PRICE STABILIZATION,
Washington, D. C., May 4, 1951.

Mr. EVERETT C. SEAL,
Brown's Meat Market,
East Falls Church, Va.

DEAR MR. SEAL: Careful consideration has been given to your application for adjustment in your slaughter of livestock during 1950 under section 9 of Distribution Regulation 1 (formerly Distribution Order 1).

The facts presented in the application indicate that it would not be consistent with the objectives and principles of the livestock and meat-distribution program embodied in Distribution Regulation 1 to approve your application.

Under the circumstances, we are therefore required to deny your application.

Very truly yours,

JOHN A. LENNARTSON,
Acting Head, Adjustment Section,
Livestock and Meat Distribution
Branch, Food and Restaurant Division.

EXHIBIT III

BROWN'S MEAT MARKET,
East Falls Church, Va., May 10, 1951.

Mr. ANDREW J. FRANCIS,
Meat and Livestock Division,
Office of Price Stabilization,
Richmond, Va.

DEAR MR. FRANCIS: I am again writing you regarding relief in my slaughtering quota requested April 2.

I have here on my desk a letter of May 4, from Mr. John A. Lennartson, acting head, Adjustment Section, Livestock and Meat Distribution Branch, Food and Restaurant Branch, OPS, Washington, D. C., denying my application.

I am hereby appealing to you this decision of Mr. Lennartson.

It seems to me that the object of the OPS is to lower the price of meat, while in my case, by forcing me to fill in with the packers' beef (provided it is available), you are forcing me to raise rather than lower my prices.

I am sure that my customers would like to hear of this particular situation. You may be assured that this establishment shall not be accused by its patrons of profiteering because of the action of Mr. Lennartson of the Adjustment Section.

I would like to know why the slaughtering quota has been imposed and, furthermore, why the 10 percent cut is necessary when it is common knowledge to all phases of the meat industry that there are plenty of cattle to be had.

The press has asked me to release my individual case, but in respect to the courtesy shown to me by you and your staff I feel it best to await your reconsideration of this matter.

Hoping to receive your immediate reply, I remain,

Very truly yours,

EVERETT C. SEAL.

EXHIBIT IV

OFFICE OF PRICE STABILIZATION,
Washington, D. C. May 10, 1951.

Hon. HARRY F. BYRD,
United States Senate,
Washington, D. C.

DEAR SENATOR BYRD: This is in reply to your letter of April 25, 1951, addressed to Mr. Don Leach, Meat and Livestock Division, concerning an application made by Brown's Meat Market, 6856 Lee Highway, East Falls Church, Va., for an adjustment of their 1950 quota bases under section 9 of Distribution Regulation 1.

The facts presented by the applicant indicate that it would not be consistent with the objectives and policies of the livestock and meat distribution program embodied in Distribution Regulation 1 to grant their request. Therefore, the request for an adjusted base for 1950 has been denied.

We are well aware of the steady increase in population in the Washington, D. C., metropolitan area, including Arlington and Fairfax Counties of Virginia. The general supply of meats is apparently fully adequate for the area at this time. However, if the supply should become critically short, steps will be taken to either divert meats from other areas or increase quotas for all slaughterers supplying the area or both, depending upon the general meat and livestock supply picture at the time.

We appreciate your interest both on behalf of Brown's Meat Market and the growing population of northern Virginia. However, reconsideration of the Brown's Meat Market application appears unjustifiable at this time.

Sincerely yours,

MICHAEL V. DiSALLE,
Director.

EXHIBIT V

OFFICE OF PRICE STABILIZATION,
Richmond, Va., May 19, 1951.

BROWN'S MEAT MARKET,
East Falls Church, Va.
(Attention Mr. Everett C. Seal)

GENTLEMEN: Due to the fact that Mr. Andrew J. Francis is now assigned to the Richmond district office, there has been a delay in reply to your letter of May 10, however, we are well acquainted with your request for additional quota and can say no more at this time than that our review board gave it a full and fair consideration before passing along our recommendations to the Washington office for final action.

As mentioned to you at the time you visited our Richmond office, it seems very important that most distribution be confined to the same channels as existed during 1950, and we must be careful that we do not assign additional quotas to one person that will need to be deducted from some other operator.

As this program unfolds we appreciate the fact that situations will change, and if you can find justifiable reasons for reviving your request for additional quota we will be very glad to discuss the matter further.

Yours very truly,

HORACE B. GANS,
Regional Price Executive,
By CLARENCE P. MOORE,
Director of Food Division.

EXHIBIT VI

OFFICE OF PRICE STABILIZATION,
Richmond, Va., September 12, 1951.

BROWN'S MEAT MARKET,
East Falls Church, Va.

GENTLEMEN: This is in reference to your application for adjusted quota for the slaughter of livestock.

Inasmuch as Distribution Regulation 1, amended on August 1, 1951, by amendment 7, no longer requires the use of quota bases by slaughterers of livestock, we will not process your application at this time. Your present registration is still effective and you may slaughter without limitation the species of livestock you are now authorized to slaughter or have slaughtered for you in a given establishment. Other species may not be slaughtered in the given establishment without authorization from the Office of Price Stabilization.

Should you wish to have this application acted upon later, kindly notify this office by letter, and processing of your application will be resumed.

Very truly yours,

HORACE B. GANS,
Regional Price Executive,
By CLARENCE P. MOORE,
Chief, Food Branch.

Our American Land—Part I

EXTENSION OF REMARKS

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. WICKERSHAM. Mr. Speaker, under the leave to extend my remarks in the RECORD, I include the following article by H. H. Bennett, Chief, Soil Conservation Service, entitled "Our American Land: The Story of Its Abuse and Its Conservation":

OUR AMERICAN LAND: THE STORY OF ITS ABUSE AND ITS CONSERVATION

(By Hugh H. Bennett)

THE PROBLEM OF EROSION

What is erosion?

Soil is not permanent. Under many conditions it is extremely unstable. When wind or water moves across bare earth they usually carry some soil with them. They may move it hundreds of miles or only a short distance, but eventually they carry away large amounts of soil, unless it is tied down.

Dense plant growth helps to slow down this soil movement. This gives nature time to replace what little soil is removed by erosion. Nature does this by constantly forming new topsoil from underlying subsoil and rock. This slow process, known as natural erosion or geologic erosion, goes on unnoticed over hundreds of years. This type is not dangerous usually; it may be beneficial to man and the earth. Many fine agricultural areas have been formed in this way.

But where land is cultivated or left bare, another and faster kind of erosion occurs. This is accelerated erosion, and it is caused by man's carelessness. When land is cultivated there is no dense growth of plants to protect the soil, and erosion may be a thousand times faster than on protected land. Accelerated erosion damages grasslands when the grass is thinned out by overgrazing. It damages woodlands left bare

by overcutting, overgrazing, and burning. This is what we now know as soil erosion, and unless it is checked, it may ruin most of our good land.

What has happened to our land?

Man seems to have a habit of wasting the gifts of nature. Nowhere has our waste been greater, however, than in our misuse of land. A survey made in 1934 indicated that we had let erosion badly damage or ruin about 282,000,000 acres of the country's crop and grazing land. Another 775,000,000 acres of our crop, grazing, forest, and other kinds of land had eroded to some extent. This is tragic, because so many farm families have lost the means of earning a living. It is tragic because productive land is the basic resource from which future generations must live. Generally the worst erosion has taken place on the farm lands of southern United States, where erosion goes on at all seasons. Much of the topsoil has been removed from large areas across the Nation and the less productive subsoil is being farmed in many places.

How fast is our land being damaged?

Today the Corn Belt is one of the larger areas being rapidly damaged. Throughout the country about 110,000,000 acres of cropland, on farms that cover around 260,000,000 acres, are now being damaged at a critically severe rate. This means that yields from about a fourth of the land now used for crops will be considerably lower within 10 or 12 years if present farming methods are continued. But prompt action can prevent most of this potential damage.

Another fourth of the land now used for crops is eroding at a less rapid but still serious rate. The present productive level of this land will decline within 15 to 30 years unless it is farmed with effective conservation methods.

Present erosion damage to the remaining half of our land now in crops is going on at rates much less serious. This does not mean that the land is producing all it can. Better farming methods, in fact, would increase production on much of it.

We are too close to the danger line

We can get along from now on with the good land we have left, but we can't keep our present standard of living if we lose much more. We now have around 480,000,000 acres of good cropland in the United States. This includes, besides that now in crops, about 85,000,000 acres that need clearing, drainage, irrigation, or other improvements. That's all we have. And all but about 95,000,000 of this 480,000,000 acres is subject to erosion if it's not protected.

So we have no more land to lose. Actually we need more good land for crops now. Too many farmers are working poor land that should be turned back to grass or woodland. More waste of good land would amount to a national crime on the part of those who are responsible—meaning ourselves.

Yet we are allowing about 500,000 acres to go down to ruin each year.

If a foreign nation should invade this country, every man, woman, and child would immediately rise to the defense of our land. We would throw the enemy out regardless of cost. Now we have gone to war against erosion.

What is productive land?

Land means different things to different people. A sailor may say that land is that part of the world not covered with water. Some geographers agree. So does Webster, who says land is "The solid part of the surface of the earth, as distinguished from water . . . especially from oceans and seas." By this standard, something like 28 percent of the earth's surface is land.

Soil conservationists, however, take a different view as to land. They are concerned with it because it is the source of the food and fiber crops we need. Soil conservationists must consider not only the land itself, but other things: Soil types, slopes, fertility, rainfall, and temperature. Their job is to protect the land from erosion and exhaustion according to its needs, and see that it is used according to its capability to grow things.

Most land produces things of value to man. It may be cotton or corn, pasture, timber, or wildlife. Whatever it produces, if we use it according to capability and protect it according to need, we maintain its productiveness.

Where the slope of fields is steeper than 8, 10, or 12 percent, the conservationist knows that the land is not safe for regular plowing. Trees and grass are better crops for land of this sort because they hold the soil in place. In regions of heavy rainfall, terraces to control runoff are built more sturdy than in areas of gentle rains. If yields drop off, the conservationist uses manure, lime, soil-building legumes, rotations, and fertilizer to restore life to the soil. He plants raw gullies to grass, trees, or vines; or, if these will not grow well, he may use small dams or other mechanical measures to stop soil washing.

This is treating land according to its needs and using it according to its capability.

SOIL CONSERVATION

What is soil conservation?

Soil conservation is proper use and care of the land. It means using the land to produce the greatest amounts of the things most needed, and at the same time protecting it so it will not lose its productiveness. The conservation measures used are being constantly improved by careful research at soil conservation experiment stations throughout the country, to meet different soil problems. All land is not alike. Each field or acre must be used for things it is best suited to produce, and protected according to its needs.

All measures that help keep the land productive are tools of conservation. Terraces, contouring, organic matter, grass, crop rotations, fertilizer, legumes, shrubs, trees, drainage if the land is too wet, and irrigation if it is too dry—all of them are conservation tools. It is conservation whether the practices are used separately or together. In other words, soil conservation includes any and all measures that will make the land produce more without damaging it.

Some of the soil troubles that conservation helps prevent are:

1. Topsoil washing or blowing away.
2. Covering good land with erosion debris.
3. Exhaustion of plant food in the soil by overcropping and leaching.
4. Accumulation of toxic salts.
5. Too much water—wet lands.
6. Lack of water—dry lands.
7. Burning of organic soils (peat land).
8. Improper cultivation.

The basis of soil conservation is wise use and proper management of all land.

How do you conserve soil?

There are many things you can do:

1. Use suitable erosion-control practices to stop soil washing and blowing.
2. Hold the rain that falls on the land, for use of crops, trees, grass, livestock, and for other purposes. You may want to hold it where it falls, or divert it to other fields or disposal areas, or store it in ponds.
3. Use manure, fertilizer, and lime where needed, in the right amounts and at the right time.
4. Use tillage, mulching, and cropping practices to protect your land and save rainfall.
5. Drain waterlogged fields.
6. Plant trees, grass, or legumes on areas too steep or shallow to plow; also on land too poor to grow field crops.

7. Quit growing clean-tilled crops on land that washes or blows easily.

8. Flood fields where toxic salts have accumulated, to leach out the salts.

9. Protect organic soils (peat land) from fire by flooding, or by raising the water table.

10. Where it is available, open up new land under conservation practices when needed to increase cropland.

11. Increase feed crops in safe grazing areas to eliminate overgrazing when grass is thin and short.

These, and other sound farming and ranching practices that protect the land and increase production, are the tools of soil conservation.

Soil conservation is the scientific use of land.

SOIL-CONSERVATION DISTRICTS

Soil-conservation districts are local units of government, operating under State laws. They are set up and run by farmers to protect farm and ranch lands from erosion, conserve rainfall, and improve productivity. They have the authority to ask and receive help from State and Federal Governments.

The first of these districts—Brown Creek soil conservation district in Anson County, N. C.—was organized August 4, 1937.

By January 1950 all 48 States, as well as Alaska, Hawaii, Puerto Rico, and the Virgin Islands, had passed district laws, and 2,220 districts had been set up. They include 1,207,812,000 acres and 4,666,463 farms.

In these self-governed districts farmers are cooperating to protect their lands. The work of each farmer on his own farm fits into a district-wide plan. They often work in groups, helping each other to apply good land use and conservation methods to their lands. Teamwork is the key to the success of soil conservation districts. It speeds up the work.

The Soil Conservation Service, and other Federal and State units, furnish technical, educational, and other aid to the districts.

WHAT SOIL CONSERVATION DISTRICTS ARE DOING

By December 31, 1949, soil conservation districts had made cooperative agreements with more than 725,511 farmers, covering 202,000,000 acres. In each case the farmer agreed to use conservation farming on all of his land. The district agreed to furnish technical aid, and in some cases machinery, seeds, and other help. A conservation plan, based on the needs and capacities of the land, and the means of the farmer, was made for each farm. The Soil Conservation Service did the technical planning for these farms and helped apply the plans to the land. Various other agencies assisted in other ways.

Work has been completed on 112,339,569 acres of this land. In 1942, soil conservation practices were applied through soil conservation districts to 7,943,000 acres. During the year following, 9,805,000 acres were similarly treated; in 1944, 10,156,000 acres; in 1945, 13,012,000 acres; in 1946, 19,332,928 acres; in 1947, 21,650,526 acres; in 1948, 20,895,561 acres; and in 1949, 24,702,266 acres. In all, a total of 132,000,000 acres has been treated.

The conservation plans are very thorough. They provide for use of each field or other area according to its capability and treatment of each acre according to its needs. In some cases it takes several years to install all the conservation work needed. Hence, the complete treatment lags behind the total acreage planned. For example: A farm plan may call for terraces and contour cultivation on 50 acres. The farmer may be able to complete terraces on only 10 acres each year. In the meantime he uses contour cultivation in the other fields. The treatment is not complete, however, until the terraces have been built, which in this case would take 5 years.

Many different conservation measures are used. Each piece of land is different and needs different practices. Some fields need

only one or two practices, while others need several. The figures below show various practices that have been planned and actually carried out in soil conservation districts:

TABLE 1—Important items of soil conservation work

Conservation measures		Planned	Applied to the land
Terracing.....	Miles.....	1,455,649	667,639
Strip cropping.....	Acres.....	9,187,190	5,320,971
Contour farming.....	do.....	32,082,100	20,661,506
Cover cropping.....	do.....	19,680,444	12,324,182
Farm and ranch ponds.....	Number.....	213,925	161,546
Tree plantings.....	Acres.....	1,129,841	554,111
Pasture and range seedings.....	do.....	14,475,197	6,157,682
Stubble mulching.....	do.....	40,709,107	32,657,821
Diversions.....	Miles.....	40,306	23,506
Farm drainage.....	Acres.....	7,750,742	4,620,784
Field windbreaks.....	Miles.....	12,659	7,222

Conservation work outside of districts

A lot of work has been done by the Soil Conservation Service outside of districts, including the making of more than 114,000 other conservation plans. Cooperating with the Extension Service, our technicians drew up plans for 9,320 widely scattered demonstration farms, as well as 105,000 other plans for demonstration areas and CCC camp areas, for erosion control on highways, and so on.

Our American Land—Part II

EXTENSION OF REMARKS OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following article by H. H. Bennett, Chief, Soil Conservation Service, entitled "Our American Land: The Story of Its Abuse and Its Conservation":

DISTRICTS PLAN FOR THE FUTURE

Most soil conservation districts have both short-time and long-time plans. Some erosion problems are so acute that they can't wait. Work on those critical areas must be done now to save some of the lands. In many localities they are the areas of first priority. Other problems can wait a few years without so much danger. So in most districts the supervisors try to start work first with those farms which need it most.

Each district has a work program that covers all of the jobs that need to be done. Each district also has a work plan that shows how each job is to be done. The first step is to have the Soil Conservation Service make a conservation survey, which shows land conditions. From this are determined the capability of the land and what needs to be done. Then the supervisors make their district work program, and then their general work plan for the district. After that, a conservation farm plan must be made in full detail for each farm. This is done by Soil Conservation Service technicians.

While work on individual farms is going ahead, however, long-time plans are developed for the whole district. Such plans show what is needed to protect all the farm-lands in the district. For example, they show things like these:

How much land of various kinds is in the district; what lands should be retired from cultivation; how much should be planted to grass, trees, or other permanent vegetation;

what lands should be brought into cultivation; where and in what amount the livestock or cash crops should be increased or decreased; how many miles of terraces are to be built; amount of land to be drained; the number of ponds to be built.

Then the district supervisors, with technical assistance, can work out how much horsepower, tractor power, and manpower it will take to do the job.

The long-time plans are based on the land condition survey, and show what machinery, seeds, planting, stock, lime, fertilizer, and other materials, as well as technical aid will be needed to finish the job. They are the blueprints for the future.

Long-time planning of one soil conservation district

The Broad River Soil Conservation District, including 8 Georgia counties in the Piedmont hill section, found among other things that much land which was being farmed there was not suitable for cropping. It also found 180,000 acres of idle land in the district. Some of this idle land was suitable for crops; most of the rest was good for pasture, meadow, and woodland. The district's program now calls for changes in the use of this misfit and idle land. Here are some of the land use changes the supervisors of the Broad River district plan to make:

	Acres
Cultivated land at time of planning	473,502
Land recommended for continued cultivation	369,333
Land to be taken out of cultivation	104,169
Recommended for kudzu and sericea lespedeza	47,350
Recommended for permanent pasture	52,085
Recommended for woodland	2,387
Recommended for wildlife areas	2,387
Idle land at time of planning	180,000
Recommended for cultivation	30,000
Recommended for kudzu and sericea lespedeza	67,500
Recommended for permanent pasture	24,000
Recommended for woodland	24,000
Recommended for wildlife areas	4,500

When these changes have been made, there will be 75,000 acres less cultivated land in the Broad River District, but the district will have 217,000 acres more pasture, woodland, and meadow. The land left in crops will be the best land and with conservation farming it will produce more per acre. This will be partly because it is the best land, and partly because it is used properly.

Detailed farm plans

The Broad River District had completed plans on 4,698 farms by December 1949. These farms make up about 37 percent of the total land area of the district. The figures below show some of the changes in land use that are being made on these 4,698 farms

Land use	Before planning	After planning	Change
	Acres	Acres	Acres
Cultivated land	254,114	233,650	-20,468
Permanent hay	2,831	49,190	+46,659
Pasture or range	49,550	83,290	+33,740
Woodland	136,671	171,948	+35,277
Idle land	47,013	0	-47,013

These farms are losing 20,468 acres of cultivated land. But they are gaining 95,676 acres of permanent hay, pasture, and woodland. Every acre of idle land has been put to work. These are the kinds of land-use changes that are being made in soil-conservation districts throughout the country.

They are changes that eliminate misfits and put the land to those uses for which it is suited.

The supervisors of the Broad River district also have figured out what equipment, materials, and labor are needed to carry out the plans. Here are their figures for four big jobs:

The job: Terracing, 360,000 acres. Needed: 360,000 horse-hours, 972,000 motor-hours, 3,132,000 man-hours.

The job: Pasture improvement, 228,000 acres. Needed: 4,962,660 horse-hours, 3,360,000 man-hours, 6,740,000 pounds of seed, 228,000 tons of lime, 57,000 tons of superphosphate.

The job: Stock, water and fish ponds, 1,200 ponds. Needed: 80,000 horse-hours, 30,000 tractor-hours, 180,000 man-hours, 60,000 feet of pipe, 1,800,000 fish.

The job: Farm drainage, 8,000 acres. Needed: 80,000 horse-hours, 8,000 tractor-hours, 412,000 man-hours, 1,680,000 feet of tile, 16,000 cubic yards of concrete.

Farmers in two-thousand-and-two-hundred-odd districts throughout the country—like those in Broad River—are going ahead with their day-to-day task of conserving the soil, but they are not fooled as to the size of the conservation program. They know there is a lot of work to do, but a highly encouraging thing is that this does not scare them. On the contrary, the challenge to save the soil or perish, plus the fact that they now know how, spurs them to action.

Districts are doing the soil conservation job every day, while planning for the future. The Soil Conservation Service is helping the districts in many ways, but chiefly with technical assistance.

LAND CLASSES

Simple land standards

At last, we have simple maps that are easy for a man to use in making his farm plans. They are called land capability maps, and are also known as conservation survey maps. These maps divide land into eight classes. The best class of land (class I shown on these maps) can be cultivated safely with no special care except ordinary good farming methods. The poorest class (class VIII) is not suitable for cultivation, grazing, or forestry, but may have some value for wildlife.

The Soil Conservation Service makes such a map of each farm before the farm plan is started. The map, serving as a base, shows how much land there is of each class and where it is. Here are descriptions of the eight land classes.

Land suited for cultivation

Class I: Very good land that can be cultivated safely with ordinary good farming methods. It is nearly level and easily worked. Some areas need clearing, water management, or fertilization. Usually there is little or no erosion.

Class II: Good land that can be cultivated safely with easily applied practices. These include such measures as contouring, protective cover crops, and simple water-management operations. Common requirements are rotations and fertilization. Moderate erosion is common.

Class III: Moderately good land that can be cultivated safely with such intensive treatments as terracing and strip cropping. Water management is often required on flat areas. Common requirements are crop rotation, cover crops, and fertilization. Usually it is subject to moderate to severe erosion.

Land suited for limited cultivation

Class IV: Fairly good land that is best suited to pasture and hay but can be cultivated occasionally—usually not for more than 1 year in 6. In some areas, especially those of low rainfall, selected land may be cultivated more than 1 year if adequately protected. When plowed, careful erosion-prevention practices must be used.

Land not suited for cultivation

Class V: Land suited for grazing or forestry with slight or no limitations. It is nearly level and usually there is little or no erosion. It is too wet or stony or is otherwise not suited to cultivation. This land needs only good management.

Class VI: Land suited for grazing or forestry with minor limitations. It is too steep, eroded, shallow, wet, or dry for cultivation. This land needs careful management.

Class VII: Land suited for grazing or forestry with major limitations. It needs extreme care to prevent erosion or other damage. Usually it is too steep, rough, shallow, or dry to be seeded to range or pasture plants.

Class VIII: Land suited only for wildlife or recreation. It is usually extremely steep, rough, stony, sandy, wet, or severely eroded.

MAKING A CONSERVATION FARM PLAN

How farmers and soil conservationists work together

The first thing they do is look over the farm. They walk together from field to field, studying each patch and parcel of land as they go, and checking with the land capability map. They see what each field is used for, and what the map says it should be used for. They also examine the pastures and woods.

The farmer tells the technician what he grows, what kind of farming he wants to do, what livestock he has, and what machinery he has, and so on. The technician points out in every field, pasture, and woodlot, what needs to be done to stop erosion and keep the land productive.

Fences and farm roads may need to be moved in some places so that they follow the contours of the land and fit in with terraces and contour farming. Field boundaries will have to be changed in some places so that each field will have land of mainly one class. Some cropland—the less favorable usually—may have to be changed to pasture, meadow, or woods. There may be some idle land that can be irrigated, drained, or cleared of brush or trees to prepare it for growing crops.

The land that is to be used for growing cash crops is selected. Then the land needed for growing feed for the livestock is selected. Crop rotations are worked out for these fields. All of this land will usually come from classes I, II, and III.

If there is any class IV land on the farm, it will generally be used for permanent meadow or hay. The land for pasture or woodlots will come from classes V, VI, and VII, if there is any land of these classes on the farm.

The farmer and technician agree on the erosion control practices to use on each field, and list them for the year ahead. Terraces may be needed on some fields. Contour tillage and strip cropping may do the job on others. Cover or green-manure crops or stubble mulch may be needed on some fields. Some pastures may need contour furrows or a water-spreading system. If ponds are needed, the sites for them have to be chosen. If the farm is in a region where rainfall is heavy, one of the most important jobs is to plan waterways to carry off excess water. The sites for waterways must be chosen and plans made to keep them from gullying, and other practices must be carefully considered and decided on.

When the details are agreed upon, they are put down in a written plan, which includes a simple farm map. This plan, known as a co-operative agreement, is signed by the farmer and the district supervisors. The farmer then is ready to install the conservation practices with the help of the soil conservation district and Soil Conservation Service technicians.

This method of working out conservation farm plans according to the capacity and needs of the land is the only practical way to get the right kind of program on the land. Farmers like this cooperative method; they

understand it. They are the final judges as to what is to be done on their land.

One of the big advantages of this kind of planning is that it is done out on the land, where the problems are. Each piece of land is carefully studied, and then the farm as a whole is studied. This is scientific planning for sound land use and effective land protection.

As a result, these conservation farming plans fit the land, fit the farm, and suit the farmer.

Our American Land—Part III

EXTENSION OF REMARKS

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following article by H. H. Bennett, Chief, Soil Conservation Service, entitled "Our American Land: The Story of Its Abuse and Its Conservation":

THE JOB AHEAD

Conservation needs for the United States

The Soil Conservation Service has made a State-by-State survey to see how much conservation work remains to be done to control erosion and conserve rainfall. It shows that, in spite of the work already done, a vast job still lies ahead.

Table I, below, shows part of what the soil-conservation job is:

TABLE I.—Important items of soil-conservation work

The job	Amount yet to be done	Labor needed	Tractor-drawn equipment needed	Horse-drawn equipment needed
	Acres	Man-years	Equipment-years	Equipment-years
Contour planting.....	124,691,000	10,253	—	—
Use of cover crops.....	31,120,000	18,369	2,019	9,241
Use of crop rotations.....	212,780,000	6,558	2,194	2,188
Strip cropping.....	96,465,000	20,255	932	3,762
Terracing.....	90,698,000	277,496	69,344	130,278
Liming pastures.....	84,448,000	24,851	808	23,786
Mowing pastures.....	111,272,000	27,603	12,102	38,225
Stock-water development (number).....	1,202,000	81,358	16,123	17,370
Shelterbelts and windbreaks.....	2,260,000	24,190	2,025	3,010
Stream bank management.....	831,000	11,356	1,129	201
Tree planting in gullies and on erodible fields.....	11,655,000	145,241	10,467	909
Protected outlets for disposal of controlled water (as that from ends of terraces).....	6,291,000	131,253	27,562	58,580

What the land is good for

The conservation-needs survey also shows what our farm lands are best fitted for. There are about 1,142,000,000 acres of farm land in the United States. About 40 percent of this area is suitable for cultivation. About 80 percent of that arable area will require protection. Around 55 percent is best suited to grazing and woodland use. The remainder for the most part is in roads and farmsteads.

When all needed shifts in land use are made, and the land is adequately safeguarded, we will have in the United States a total of about 460,000,000 acres of good

cropland suitable and safe for producing our food and fiber crops.

This land must be protected.

PRINCIPAL CONSERVATION PRACTICES

Here are explanations of the major conservation farming measures.

Contouring: Plowing, planting, cultivating, and harvesting sloping fields on the level; that is, farming on the contour, around hillsides with curving furrows to fit the lay of the land, instead of straight furrows up and down hill. The curved furrows catch rainfall and allow much of it to soak into the ground. This conserves water and reduces the amount of soil that is washed away. Part of the water that soaks into the soil is used later by crops. Another part is added to the underground water supply to feed springs, wells, streams, and ponds.

Contour furrowing: Plowing furrows on the level to hold rainfall so it can help the growth of pasture and range grasses.

Cover crops: Dense crops that prevent erosion of cultivated areas at times when there are few or no other plants to protect the land from wind and water erosion. Legumes are widely used as cover crops.

Fertilizing land: Use of manure or fertilizer on land that needs additional plant food to stimulate plant growth.

Crop rotation: Alternating production of various crops on a piece of land, to keep the soil productive and improve it. In a good rotation, one crop, or series of crops, helps the next crop. For example, nitrogen—needed for plant growth—is added to the soil by legumes, such as clover, alfalfa, and cowpeas. These plants have the power to take nitrogen out of the air and through their roots store it in the soil. After they have rotted, the nitrogen can be used for growth by plants that do not have the power to fix nitrogen, such as corn, cotton, and potatoes. Rotations often are used with strip cropping by shifting the close-growing strips and the tilled strips at fixed periods. In this way the soil is improved by the same cropping system used to stop erosion.

Strip cropping: Planting strips of close-growing plants—like grass or clover—between alternate strips of clean-tilled row crops, on or nearly on the contour. The strips of close-growing plants hold water and keep it from eroding the cultivated strip below. They also catch soil picked up by water from the plowed strips above, straining it out of the runoff. Wind strippling is planting alternate strips of clean-tilled and thick crops at right angles to the prevailing wind. Field strippling is planting alternate strips of cultivated and thick crops roughly at right angles to the main slope of the land.

Terracing: Ridging land on or nearly on the contour. The farmer builds up low barriers—ridges or embankments—of soil across sloping fields to intercept rainfall. Terraces with slight grade slow down runoff water, guiding it to safe disposal at the sides of the fields. This controlled excess water runs off too slowly to cause erosion. Level terraces, suited to dry country, hold all the rainfall on the land.

Diversion channels: Channels with a ridge on the lower side. The ridges sometimes are larger than field-terrace ridges and are farther apart. Otherwise they are much the same. They are built across slopes to divert damaging or wasteful runoff. They are used to check erosion much the same as terraces.

Protection of water-disposal outlets. Protected channels and outlets carry off excess water from terraces and near-contour crop rows. These waterways are stabilized against erosion by grasses, legumes, and vines. They include meadow strips, grassed ditches and diversion ditches, and grassed areas at the ends of field terraces.

Green manuring: Turning under grain, legume, or grass crops while green, or soon

after they mature. This is done to improve the soil by adding to the supply of organic matter.

Perennial hay production: Using land not suitable for cultivation to grow hay. The land should not be plowed as a rule, except to renew planting. This is different from temporary plantings of perennials like timothy and alfalfa on land used for cultivation, as is often done in crop rotations.

Pasture development: Developing new pastures with selected grasses and legumes, and combinations of grasses and legumes. It includes fertilization, liming, drainage, irrigation, fencing for grazing control, and other measures.

Pasture improvement: Using measures that increase growth and improve quality of forage grasses. It includes such measures as rotation grazing according to carrying capacity; stock-water ponds placed to encourage even grazing; spacing of salt and bedding grounds for the same purpose; reseeding; liming and fertilizing; basin listing and contour furrowing; water spreading; weed control; and fire protection.

Drainage: Removal of excess water from wet land by ditches or by tile drains. Such artificial waterways must be kept free of silt by protecting the watershed from erosion. Open ditches must be kept free of plant growth and debris that stop drainage.

Irrigation development and improvement: Management of water brought to the site by canals and ditches to help the growth of crops. It includes building and improving water distribution systems on farms; land preparation, such as leveling and contouring; measurement and control of water; development or improvement of springs and wells; and disposal of waste water.

Gully control: Using plants and mechanical measures to stop eroding gullies. These measures reduce the rate of water flow within gullies or by diverting water away from heads and sides of gullies. It is done by using: (1) Grass, vines, trees, and shrubs; (2) fumes and other devices to lessen the cutting power of waterfalls; and (3) dams for catching silt.

Field and gully planting: Planting eroded or erodible land, which is unsuitable for cultivation, to trees, shrubs, grasses, vines, or other useful plants and siltation and aid production of fish and other pond wildlife.

Pond management: Use of suitable measures to protect ponds from erosion and siltation and aid production of fish and other pond wildlife.

Stubble mulching or mulching: This practice is also called subsurface tillage. It means leaving crop residues and soil-improving crops on the ground instead of turning them under with plows or burning them. These materials include grain stubble, straw, cornstalks, crotalaria, lespedeza, and other protective crops. Mulching protects the soil from erosion and baking, cuts down erosion and evaporation, helps the soil to soak up more rainfall, and aids growth of useful bacteria in the soil. The practice requires implements that do not turn the soil upside down.

Shelterbelts; windbreaks: Plantings of trees and shrubs in strips usually 1 to 10 rows wide. The main purpose is to deflect wind currents, thereby reducing wind erosion and snow drifting. Such strips of trees and shrubs also conserve rainfall and protect fields, gardens, livestock, orchards, and buildings.

Water spreading: Controlled spreading of runoff water from the foot of slopes and from gullies and washes over nearby land that needs it. This is done by dikes, dams, and other means for directing water from one place to another. The object is to make use of all water in low-rainfall areas, rather than waste it.

Woodland harvesting: Cutting for lumber, pulp, and other uses, according to sound

forestry practices. Such cutting helps sustain yields and promotes rapid growth. Also to salvage dead or damaged trees.

Improvement cuttings: Cutting woodland mainly to encourage growth. It is also done to increase the utility of the forest for other uses than wood production, such as watershed protection.

Management of odd areas: This means development of odd portions of farms and ranches, such as fence corners, rocky areas, and sinkholes for wildlife purposes. It includes use of plants suitable for that purpose.

Meanings of some conservation terms

Sound land use: Using every acre according to its capacity, with methods that maintain productivity. Such use is based on factors of: (1) Soil, slope, kind and extent of erosion, and liability to erosion; (2) climate; and (3) economic problems. Good land use puts all land to work, instead of permitting some of it to lie idle. It means the safe use of land for useful and suitable crops.

Carrying capacity: The amount of livestock an area of pasture or range will feed through a grazing season, under average conditions, without permanent damage to land or grass. Grazing capacity is determined by range surveys.

Grazing season: Part of year animals can be profitably grazed without permanent damage to land or grass.

Farm-conservation plan: Plan for use of all land on a farm according to its needs and capacity, and the farmer's desires and facilities.

Soil-saving dams: These are dams, built of earth, rock, or other local materials, across gullies or natural watercourses to catch silt, slow down runoff, and reduce erosion.

Runoff: Part of rainfall (including melted snow) not absorbed by the soil or not lost by evaporation—that is, the part that runs off the land into neighboring drainageways.

Technicians: Technically trained men who assist with the soil-conservation job of treating all the land of farms according to capacity to produce and according to needs. To do a complete job of this kind requires the joint (properly coordinated) contribution of land specialists, agronomists (crop specialists), foresters, engineers, wildlife specialists, and whatever other specialists may be needed to carry out the complete farm job.

Exhaustion of plant food: Excessive removal of plant nutrients (plant food constituents) in the soil in the agricultural products taken off the land.

Permanent pasture: Areas used continuously for pasture (for grazing) or meadow (for hay).

THE DEMAND FOR CONSERVATION

The farmers of the United States in growing numbers are asking for help in putting conservation on their land—mainly technical help. Ten years ago, when conservation farming was new, few knew about it; today hundreds of thousands realize its value and want it. The thousands and thousands of requests on hand show that American farmers understand fully the importance of conserving their own and the Nation's soil and water resources.

Farmer applications for assistance

By December 31, 1947, 850,518 farmers had applied for farm plans through the 1,855 soil-conservation districts then operating. This does not include the large number of requests from groups of farmers. In 1945, 118,878 individual requests were received from farmers for conservation plans for 33,000,000 acres. In 1946, 172,520 farmers, operating more than 45,000,000 acres, asked for such plans. At the same time the number of groups asking for help was steadily increasing.

In addition, one or more practices were applied at the request of farmers on hundreds of thousands of farms not covered by farm plans.

Filling the requests from farmers, of course, means that the districts in turn must get aid from the Soil Conservation Service or other agencies. The Service is now helping virtually all of the soil-conservation districts in the country. This aid will be extended to all districts and increased as rapidly as possible.

HERE'S WHAT THE FARMERS SAY

Throughout the United States soil-conservation work has brought real and material benefits. Farmers and ranchers who have received these benefits have agreed on their value. East, west, north, and south, they have voiced their approval of soil-conservation methods and the resulting gains, in group meetings and in letters.

In 1943 more than 9,300 farmers, who operated 3,972,173 acres, reported on the benefits derived from soil conservation.

Of the 9,300 farmers who reported 8,931 said that their crop yields had been increased by the conservation farming methods they were using. They estimated that their average yield increase for the major crops grown throughout the country was 35.7 percent. This means that every 3 acres farmed the conservation way was producing more than 4 acres farmed the old wasteful way.

Furthermore, 6,261 of these farmers reported that work on their farms had influenced 38,636 other farmers to start conservation farming. Furthermore, 3,628 of these district cooperators have actually helped 18,170 neighbors to plan and apply conservation work on their farms.

Here, in their own words, are what some of these thousands of farmers and ranchers have to say about the soil-conservation program:

W. J. Waits, of Pickens, Miss., Holmes County Soil Conservation District, in 1937, grew 80 bales of cotton on 250 acres. In 1944, he said, he produced 45 more bales on 75 acres less land, and made a total increased income of \$17,200.

Frank Kalina, of Pawnee City, Nebr., Turkey Creek Soil Conservation District, said he about tripled his income by conservation methods.

G. V. Carpenter, of Forest City, N. C., Broad River Soil Conservation District, wrote: "If the soil-conservation people had not advised me, I would have lost my farm."

Carl Lindblad, of Wolsey, S. Dak., Carpenter County Soil Conservation District, reported: "My farm was so severely eroded by wind that it was impossible to carry on any farming operations, but with the help of the soil-conservation people and equipment my farm has again been made productive."

D. J. Lay, of Westminster, S. C., Upper Savannah Soil Conservation District, writes that his lint cotton yields have increased 275 pounds per acre as a result of conservation. He reports other increases, and adds that in 1 year his benefits from increased production amounted to \$6,118.

Ralph E. Kamper, of Freeburg, Ill., Shiloh-O'Fallon Soil Conservation District, reports that erosion has been stopped, and wheat production increased 7 bushels per acre by conservation, and adds: "These contour fields are much easier to work, as well as being easier on the equipment."

Donald Rook, of Grand Junction, Colo., Orchard Mesa Soil Conservation District: "Sugar beets on conservation-improved soil have given an average yield of 16 tons per acre in 1943 and 1944. On the same type of soil without the proper treatment, the average yield has been 8 tons."

W. H. King, of Smyrna, Tenn., Rutherford County Soil Conservation District: "Before I started conservation farming this farm produced approximately 25 bushels of corn

per acre; now it produces 35 and 40 bushels. Cotton was 1,000 pounds an acre, now 1,500 pounds; wheat 10 bushels an acre, now 15 bushels. I have been able to increase my beef herd from 14 to 30 head."

A. B. Parker, Americus, Ga., Lower Chattahoochee River Soil Conservation District: "Before the soil conservation district program was put into effect on this farm, 13 tons of peanuts were produced, which was all the cash crops from this land. Last crop year, from the same land, we sold 51 tons of peanuts, 5 tons of blue lupine, 6 tons of crotonaria, and 1,000 bushels of wheat. We paid \$11,200 for this farm and it is our belief on a conservative estimate we could sell this farm now for \$22,400."

Harry V. Burens, Englishtown, N. J., Freehold Soil Conservation District: "An annual yield increase of about 30 percent . . . erosion on sloping ground was controlled 100 percent."

J. W. Whittenton, Forrest City, Ark., South Crowley Ridge Soil Conservation District: "In 1935 I had no fences, very few work stock, and no tractor, and had to buy feed most every year. In 1937, the Soil Conservation Service started me to farming my land like it should be farmed . . . now I have plenty of work stock, three tractors, and other tools all paid for . . . my gross income in 1936 was \$7,000 and in 1944 my gross income increased to \$18,500, and I still have feed and seed to sell."

Hugh Darnell, Porter, Okla., Arkansas-Verdigris Soil Conservation District: "When I bought the farm in 1939 . . . the total cash from crops was \$861 (for 1 year). During the 6 years I have followed my conservation plan the productive value of my land has increased from \$20 per acre to \$45 per acre. My total cash income from the farm in 1944 was \$5,802.82."

L. L. McAllister, Greensboro, N. C., Haw River Soil Conservation District: "In 1940 my farm was not making a dime of profit and hadn't made a profit for several years. That fall I started following recommendations of the Soil Conservation Service. Crop yields increased. Lost motion was reduced."

Per acre cost of production went down. An actual profit was realized in 2 years' time. Details of how would be too long to recite. On the next farm the combination would be different anyway. The important thing is that I began to make money instead of losing money. . . . Upon inquiry at your local office, I found that the total cost of helping me plan and carry out a conservation system was approximately \$135. . . . The Government invested \$135 in me and the land I farm. So far I have paid into the United States Treasury a total of \$2,511.98 on account of income the farm produced. I will pay about \$1,000 more this year. I can't see into the future, but my production cost is low enough so that I can reasonably expect to pay something every year."

Victor Lasky Writes the Strange Story of the Hollywood Ten

EXTENSION OF REMARKS OF

HON. ISIDORE DOLLINGER

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Wednesday, August 15, 1951

Mr. DOLLINGER. Mr. Speaker, Mr. Victor Lasky, the well-known writer and coauthor of *Seeds of Treason*, has recently spent a month in Hollywood. He

has written an article for the September issue of *Cosmopolitan* magazine entitled "The Strange Story of the Hollywood Ten." Following is a report on the article as it appeared in the August issue of *The Exhibitor's Digest*:

The Communist Party has taken a licking in Hollywood.

That is the conclusion of Victor Lasky, editor, newspaperman, and one of the Nation's foremost authorities on communism, in an article which will appear in the September issue of *Cosmopolitan* magazine.

Mr. Lasky, coauthor of *Seeds of Treason*, recently spent a month in Hollywood. He attended the hearings in Washington of the House Un-American Activities Committee. His article is entitled "The Strange Story of the Hollywood Ten."

Mr. Lasky points out that even in the heyday of Communist infiltration in the motion-picture industry the overwhelming majority of people connected with the movies detested the Communist Party.

He also reports that the Reds never had much success in influencing the actual content of the movies. For one thing, none of the major producers—the men with the final word—was ever pro-Communist, and very few of the directors were. The writers and actors were not in a very good position to be able to influence the finished content of a movie as it would finally come from the cutting room.

"Today the movie industry is working energetically to rid itself of the 'Commie' label and to keep the Communists out of the studios. As a result, the Communists and pro-Communists are openly repentant, on the scrap heap, or on the run. Hollywood, it seems, has learned a painful lesson from the revelations at the trial of the Hollywood Ten—and the lesson will be remembered for a long time to come."

Radio Address of Jim Wyatt, over KOIN, Portland, Oreg.

EXTENSION OF REMARKS OF HON. WALTER NORBLAD

OF OREGON
IN THE HOUSE OF REPRESENTATIVES
Thursday, September 27, 1951

Mr. NORBLAD. Mr. Speaker, under leave to extend my remarks, I include herewith a transcript of a portion of one of the many outstanding broadcasts made by Jim Wyatt over KOIN, Portland, Oreg. This particular broadcast was on August 31, 1951.

The more one examines the world situation, the more clear it becomes that a great element is lacking on the western side. That element is inspiration.

A weakness of the western position is the weakness of being antismething. The Western World bristles with guns and arguments in the name of anticommunism, but behind it is a motivating influence of fear.

The Korean fiasco presents a stern object lesson. First there was the fear of calling it a war, and declaring so, and then there was the fear of taking steps to win it.

For its part, the Communist world waves a banner of inspiration to underprivileged people around the world who figure they have nothing to lose. Under the gleaming heraldry of its promises, the people may trade over from political corruption into political slavery—but that is something that they

find out later. What is offered to them at first is the bright hope of Communist promises against the background of meaningless lives. The West has not yet offered them a rival inspiration.

The brave banner of human dignity and freedom which should be unfurled has become lost somewhere along the fear-conscious military assembly line. The Western World is still looking for inspired leadership, but fearful utterances from those in high places will not provide that inspiration. That which is needed is the inspired hope to shape the minds of men.

It is inspiration which lifts men from the doldrums of their fate to believe in those causes for which, if necessary, they stand alone with torch upraised against the blackest terror. It was not so much to New York's massive monuments of material that the people of this land were taught to look with pride and honor—but rather to the inspired words of Emma Lazarus graven on the Statue of Liberty in that harbor.

"Send these, the homeless, tempest tossed to me

"I lift my lamp beside the golden door."

The cause of human dignity and freedom has burnished history's finest hours. Victory has not always gone to the powerful, but to the inspired—as with Washington's bedraggled army at Valley Forge—as, in a modern day, when Winston Churchill rallied his bent and bleeding nation to stand alone against the conquering German Goliath.

The trumpet call of human dignity and freedom can yet find echoing strains in every corner of the world. "It is for us the living" said Lincoln "to be here dedicated to the great work which they, thus far, have so nobly advanced."

These inspirations are the missing factor in the current world-wide struggle for the minds of men. For the best that is in men's minds is not motivated by either guns or butter. It rises rather to that cause which puts meaning and purpose into life, and if need be, cloaks death itself with the noble mantle of service.

The great tradition of human freedom and dignity which the Western World has born and nurtured through the darkest valleys of the tumbling centuries—that is the banner to be unfurled. That is the standard to which all men may repair, and were it so, this timidity toward a Tartar tyrant on a teetering throne would vanish in the rising consciousness of our own true and historic worth.

That is the true fortress of our impregnable strength.

Statehood for Hawaii

EXTENSION OF REMARKS OF HON. JOHN C. STENNIS

OF MISSISSIPPI
IN THE SENATE OF THE UNITED STATES
Thursday, September 27, 1951

Mr. STENNIS. Mr. President, I ask unanimous consent to have printed in the Appendix of the Record an editorial entitled "Senator Butler Called the Turn" from the Kearney Hub, of Kearney, Nebr. This editorial has to do with facts concerning the admission of Hawaii into the Union as a State, and refers to a speech recently made in Kearney by the senior Senator from Nebraska [Mr. BUTLER].

There being no objection, the editorial was ordered to be printed in the RECORD, as follows:

SENATOR BUTLER CALLED THE TURN

Some citizens may wonder why the Senate is dragging its collective feet on granting statehood to Hawaii. United States Senator HUGH BUTLER of Nebraska, however, explained the situation in a recent speech.

Senator BUTLER was chairman of the Senate Committee on Interior and Insular Affairs about 4 years ago, when the statehood question first came up for serious consideration.

Despite a lack of knowledge of the state of affairs in Hawaii, some Members of the Senate wanted to grant the Territory immediate statehood. Others, however, had heard the Communists had secured control of the major unions and also had a big toe hold in one of the major political parties.

Senator BUTLER spent 3 weeks in Hawaii in 1948, holding public hearings, and members of the committee staff were there for a much longer time, making investigations quietly.

In his report, Senator BUTLER listed the names of the entire executive committee of the Communist Party for the Territory of Hawaii. His report caused quite a sensation at the time, and the Senator was criticized by those most active in advocating statehood for Hawaii.

But a few days ago, the FBI took into custody a group of 7 Communists in Hawaii on a charge of conspiring to bring about revolution and overthrow of the Government. Of the 7 arrested, Senator BUTLER had named 6 of them in his report, 3 years ago.

In Hawaii, the Communists control the one big labor union, the International Warehousemen's and Longshoremen's union, whose top boss is Harry Bridges, the Australian Communist, now under sentence of deportation. The Reds also control the union which supplies labor for the sugar and pineapple plantations.

By encouraging members of the Longshoremen's union to join political clubs of the two major parties, the Reds succeeded in having some 15 Reds placed as delegates, and sufficient other "fellow travelers" to take an active part in the affairs of one of the parties.

Jack Hall, one of the seven men arrested, still is regional director of the longshoremen's union, and, not until he was out on bail could negotiations be continued to secure a wage contract in the sugar industry.

It is so evident that a house cleaning will be necessary before Hawaii can seriously be considered for statehood.

Springfield (Mass.) Auto Club Celebrates Fiftieth Anniversary

EXTENSION OF REMARKS OF HON. FOSTER FURCOLO

OF MASSACHUSETTS
IN THE HOUSE OF REPRESENTATIVES
Thursday, September 27, 1951

Mr. FURCOLO. Mr. Speaker, I wish to call the attention of the Members to the fact that the Automobile Club of Springfield, Mass., is celebrating its fiftieth anniversary this week. There is to be a parade of antique automobiles and other events. Mayor Daniel B. Brunton has proclaimed this week Auto Club of Springfield Week.

The Springfield club is the oldest of its kind in New England and is 1 year

older than the American Automobile Association. Its record of achievement in the field of serving motorists is well-known.

I know that all Members will want to join with me in extending best wishes to the club.

Sergeant Szary's Penalty

EXTENSION OF REMARKS OF

HON. OVERTON BROOKS

OF LOUISIANA

IN THE HOUSE OF REPRESENTATIVES

Monday, September 24, 1951

Mr. BROOKS. Mr. Speaker, I invite the attention of the Members of Congress to the type of justice meted out by the courts of the District of Columbia. I especially want to point out the judicial value placed upon human life by the District bench in Washington, D. C.

In February 1951 Master Sgt. Stanley Szary, of Bolling Air Force Base, confessed to District police that he was the slayer of his wife, Mrs. Wilma Daniels Szary, formerly of Shreveport, La. Mrs. Szary had been beaten to death by her husband when she was late in returning from a shopping trip.

The coroner reported that at least eight of her ribs had been broken, her liver and a kidney were ruptured, and she suffered a cerebral hemorrhage. The undertaker told me that the face of the young woman was horribly mangled. The sergeant readily admitted that he had beaten her until she collapsed.

At first authorities viewed this crime seriously. He was, however, indicted for second-degree murder, and the case went to Mr. William T. Arnold, assistant United States attorney, for prosecution. Szary was permitted to plead guilty of manslaughter instead of being tried for murder, and this plea was permitted over the objection of the major instigating officer, who felt the case was serious enough to demand trial for murder.

Judge Sweinhart, of the District bench, accepting the plea of guilty, felt that a \$1,000 fine was sufficient to atone for this particularly heinous crime.

Upon payment of the fine from money raised by the sale of joint property of this man and his slain wife, Szary was released. And, upon the recommendation of someone, I am told that he was promptly restored to active duty.

Someone else must have thought that the assistant United States attorney working for the prosecution did a good job in handling the Szary case; he has since been promoted.

I understand that the judge's light sentence was passed on Szary's plea that someone had to take care of his children, and thus in spite of the plea of the family of the deceased young woman that he is not the proper person to take care of children of tender age.

A welfare investigation disclosed that the parents of Mrs. Szary, Mr. and Mrs.

W. D. Daniels, of Shreveport, La., are well qualified and anxious to care for the children of their slain daughter although the children are now in the custody of the convicted man. This investigation found the Daniels to be upstanding citizens who occupy positions of respect and responsibility in their community; but are without influence, apparently, such as to demand consideration from the office of the United States attorney in the District of Columbia.

I doubt if those in authority in the Armed Forces sense the significance of this case. Certainly they had a right to rely normally upon the appraisalment of the importance of this crime as placed by the District courts upon it. With merely a fine of \$1,000 for killing the wife, a mother with two small children—one a baby just a few months old—the military authorities could easily assume that this offense was in line with the gravity of reckless driving, bootlegging, and petty larceny. Such naturally would be the public acceptance of the judicial appraisalment of a particularly lurid and vicious crime.

The Armed Forces have entertained a laudable desire to maintain a high moral standard among enlisted men and it is commonplace for them to refuse to accept as enlisted men those who in the indiscretions of early life commit minor juvenile delinquencies.

I certainly have no quarrel with such a policy but rather choose to commend them most favorably for this policy. I doubt that those in military authority are aware of the Szary case.

Recently committees of Congress have been investigating crime conditions in the District of Columbia and making recommendations to Congress. Perhaps this is one case which will receive a prompt and full investigation by the appropriate committee.

What is the value of the life of a wife—mother of two small children—in the District of Columbia?

Defending Extravagance Is Still Popular

EXTENSION OF REMARKS

OF

HON. GLENN R. DAVIS

OF WISCONSIN

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. DAVIS of Wisconsin. Mr. Speaker, I take this opportunity to insert an editorial from the Waukesha Freeman, of Waukesha, Wis. G. H. Koenig, its editor, has well expressed the major reason for the constantly mounting Federal spending.

Members of Congress, of course, have a great responsibility. Congress, after all, does have the power of the purse. But once the executive department has made its request for funds, all the weight of Government and of various pressure groups are marshalled in support of that

request. Individual Members of Congress who stand up against such requests too often become mere ants in the path of the steamroller. There can be no real Government economy without the cooperation and active leadership of the President. Such cooperation and leadership do not now exist.

DEFENDING EXTRAVAGANCE IS STILL POPULAR

President Truman's attempt yesterday to dispel the fears of the American people over his administration's reckless fiscal policies is as presumptuous as it is misleading. Speaking at the dedication of a new building for the general audit office, the President seized an opportunity to lash out at criticism of monumental spending and mountains of debt and give assurance that the country is "stronger economically than ever before." He added that his critics are only trying to "frighten voters—particularly as visions of election dance through the heads of gentlemen who are politically inclined."

The fact is that criticism of our idiotic fiscal policy, which is in defiance of all reason and experience, is not something that has been trumped up in advance of the 1952 Presidential election. This reckless policy was conceived and nurtured as early as the 1930's and has been handed down from one Presidential term to another. Regardless who becomes the country's next chief executive, the spendthrift ways the Washington Government has fatuously pursued will not disappear for the very reason that President Truman can even now stand up and proudly defend them. High-level spending, public debt and governmental waste and extravagance have become so much a part and parcel of the National Government that President Truman finds it appropriate to excuse each and all of them in bristling language and is so bold as to say the criticism is based on "misinformation."

It is axiomatic that no real curtailment of waste can be achieved by Congress without White House leadership. Instead of providing that leadership the Truman weight has been used to frustrate congressional attempts at reduction. Publicly, he has urged his heads of bureaus and departments to cut down nondefense expenditures but privately he has permitted them to classify almost every activity as linked with defense. There is no lack of detailed authoritative blueprints for cutting the nondefense cost of Government. Any number of organizations and individuals, from the Hoover task forces on down, have indicated the way in precise terms, not just generalities. In each case they show how many billions of dollars can be pared without damaging any essential governmental function. It is true that some cuts have been made by Congress when appalled by the size and scope of the President's proposed budget. But these cuts have been of a relatively minor nature. The big economy issues have been avoided.

Moreover, this is not a partisan fight. A Democrat, Senator Byrd, has long been the most consistent advocate of tough economy in Government—no Republican has worked as hard in this direction. And lately, a comparative newcomer to the Democratic ranks of the Senate, Senator DOUGLAS, has taken up the torch. As it happens, Senator DOUGLAS subscribed almost completely to the late President Roosevelt's New Deal program, and he approves of much of President Truman's version of it. However, he abhors waste and extravagance in Government and says so on every possible occasion. This, incidentally, has put both Senators BYRD and DOUGLAS in the White House doghouse. Because they have the courage to express their views the President is bitterly hostile to both. Reform

can only come when those in positions of leadership like the President will throw their weight on the side of economy, smaller budgets, and debt retirement instead of defending the policies which stand in the way of such achievement.

Individual Initiative of American Citizens

EXTENSION OF REMARKS

OF

HON. EDWARD J. THYE

OF MINNESOTA

IN THE SENATE OF THE UNITED STATES

Friday, September 28, 1951

Mr. THYE. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD an address I delivered at Worthington, Minn., on Wednesday, September 26, 1951, at the Turkey Day festival.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

What has made the United States the great nation that it is, and how can we keep it so?

America was founded on ideals of human freedom. It has been built on the bedrock of individual initiative. These are the prime factors that have given us the know-how in industrial achievement so that our people generally today enjoy more of the material comforts than any other nation in all history.

This freedom and initiative have made us the mightiest nation of our time. With our economic and military strength, backed by the spirit of our people, we have become the recognized leader of the free nations of the world in a struggle against a philosophy which would destroy human liberty and which would dull the creative spirit of man.

There are those, even in America, who think that this foreign ideology is better than the American way. They forget that in the United States the people are sovereign. Back of the iron curtain the people are slaves to an all-powerful state.

A free people have a strength which cannot be matched by those who are dominated by government. A free people have resources of faith in themselves, in their institutions, in their future, which cannot be equalled by those who must blindly follow the whims of a dictator. A free people will fight for freedom and liberty, as all generations of Americans have done.

They will work for it, too, because there are rewards for initiative. There is opportunity for betterment. The young hired man on the farm can always aspire to be a farm owner in his own right. Frequently he gains that ambition. Our schools and educational institutions are based on the ideal of equal opportunity and the humblest youth can achieve a professional career or operate a business of his own. There is still a chance for him to become President.

Every citizen is secure in his home. He may worship God in the church of his own choice, with dignity and without interference. He can freely express his opinions and there will be no secret police to turn in a report or drag him from his home in the dead of night. He can listen to his radio, and he is pretty certain to have one, and he can drive his automobile on fine city streets or on modern highways along a quiet countryside. He can read a newspaper and draw

his own conclusions from what he reads, for the press is free and its readers are free.

These are all rather commonplace factors in American life. We take them for granted. But have you ever stopped to consider how very uncommon they really are? Where else in the world today do you find that orderly freedom, that basic security, that opportunity? They are symbols of this Nation's greatness because all of them minister to human needs and human aspirations. All of them are the fruits of freedom and initiative.

They would not fit into the scheme of things if the Communists had their way, but it is not only the Soviet schemers in the Kremlin who threaten that way of life. There are some dangers we need to overcome within our own country if we wait to keep this great America of ours.

One of the biggest dangers to individual initiative is too great reliance on the Federal Government for assistance, direction, and control of our everyday lives. Self-reliance is one of the best of all American traits. Every time we look to Washington for some benefit or some new service, which we ought to be doing for ourselves, we chip off a little of our individual initiative. Our Government becomes more all-inclusive, more powerful, more far-flung and costly. And with this accumulating loss of individual initiative and self-reliance we lose, also, a part of that other great factor which has made America great—our freedom.

Closely related to such increased dependence on Government is another danger, which to all of us is immediate and apparent. That is the danger of excessive taxation. It is an old saying that the power to tax is the power to destroy. Excessive taxation will quickly destroy free enterprise and stifle the energy, the creativeness, and the will to achieve upon which our industry, our agriculture, our whole capacity as a people are based. One of the most compelling tasks to which citizens of this country, and those they elect to public office, must devote themselves is reduction in the burden of taxes. We can only tax less if we spend less. Thrift, economy, and efficiency are pretty fundamental virtues. Our Government in Washington needs to learn these fundamentals.

Thirdly, we need to keep an appropriate balance among the economic segments of the Nation. It is a magnificent tribute to our farm people that, although they make up only 16 percent of the whole population, they have utilized the know-how, the initiative, and the hard work which are the foundation of America's greatness in all fields, to produce sufficient food and fiber to meet the needs of a nation of 150,000,000 people, and some to spare.

There is reason for concern that our farm population, one-sixth of the total, received from farming operations only 7 percent of the total national income last year. In other words, one-sixth of the people doing a job at the very foundation of our strength and security in this critical time are receiving roughly one-fourteenth of the rewards in terms of take-home pay.

The agricultural price-support program is intended to give the farmer parity with other groups, while recognizing that he faces many hazards and uncertainties in his operations. That program is sometimes attacked, but it is basically right. It was recently attacked in a way that is both unfair and untrue by a gentleman in Washington who happens to be steeped in the idea of controls at the Federal level.

The Price Administrator, Mr. DiSalle, has been quoted as saying that he cannot control inflationary food prices, or give relief to the consumer, because the price-support program keeps the level of farm prices too high.

That statement is not in harmony with the facts. In fact it simply isn't true.

Prices received by farmers have been declining for the past 6 months, while the retail cost of these foods was unchanged from May to July, and is now on the upward trend. The farmer's share of the dollar that consumers spend for farm foods is less right now than when Mr. DiSalle first took office, and the consumer is paying more than he did. These facts are clearly shown in the price indexes of both the Bureau of Agricultural Statistics and Department of Labor.

With the exception of beef and mutton, which have been above parity, only one or two farm commodities have reached parity prices. Let's just take a look at the record.

Wheat was selling for \$2.21 on February 15. It dropped to \$2.05 on August 15. Parity is \$2.41.

Potatoes were \$1.03 on February 15, and had gone up to \$1.17 on August 15, but since the parity price is \$1.80, potatoes are at 65 percent of parity.

Milk is lower in price too. It averaged \$4.63 a hundred on February 15 and was down to \$4.45 on August 15. That is 95 percent of the parity price figure of \$4.79.

Eggs at 49.7 cents a dozen, on the average, are at 91 percent parity; chickens at 83 percent.

These parity figures clearly show that the agricultural price support program, to give the farmer not more but an equal share with the laboring man, the merchant, the industrialist, and professional man and woman, has not been responsible for the inflationary trend in the costs of living.

The Senate Committee on Agriculture has, moreover, concluded on the basis of extensive research that the substantial stocks of food products and feed grains, stimulated by and resulting from price support programs, has been an important influence holding down inflationary increases in retail food prices since the beginning of the Korean crisis. The agricultural program, from every point of view, has been a stabilizing, and not an inflationary, factor. It is time that our bureaucrats looked at the facts and stopped giving false information.

Let me cite a fourth danger about which we must be concerned if we are to keep America great. Our strength as a nation will vanish, our economic well-being will be worthless, our individual initiative and freedom will become tarnished, free enterprise will fall prey to all kinds of collectivist schemes if we try to sustain the American way of life without character and without faith.

Recent investigations in Congress have brought to light all sorts of shocking conditions, ranging from the peddling of influence in high places in our Government to outrageous evidences of powerful criminal rackets operating at the expense of our people. I need not recite the sordid list.

Some people of little faith, aided and abetted by enemies of our country, say that we are doomed, that these shocking revelations prove the depravity of our country. I have great faith in America. I believe that we are bringing these things out in the open in order to clear out the rubbish in our national life. Crime and corruption cannot stand the light of day. Those who think the Government of the United States is for sale are being tried at the bar of public opinion. You and I know what the verdict will be. It is not now true, nor has it ever been, that anything goes.

Let us not minimize these dangers or these symptoms. Let us rather determine to meet the supreme obligation upon our generation to keep America great not only by destroying these evil forces but by conserving the American way of life.

Stopping Unnecessary and Unauthorized Spending

EXTENSION OF REMARKS OF

HON. ALVIN F. WEICHEL

OF OHIO

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. WEICHEL. Mr. Speaker, the Government of this country has spent over \$260,000,000,000 more than it has collected, continually spends money not appropriated and requires deficiency appropriations and the Administration is asking for additional billions of dollars to spend that the Government does not have, all of these moneys going to bureaus and often spent by the bureaucrats without regard to waste, authorization, and the intent of Congress. The Congress has been further requested to authorize the spending of "what we don't have" to spend tens of billions more money than the Treasury will collect as income, even in the face of the Government now being in debt for more than \$260,000,000,000.

Should the Congress continue the administration in its spending of billions more than the income, as requested by the administration?

With such a program of spending is there any wonder that bureaucrats waste and spend other than authorized, spend and give away for purposes not intended by the Congress, for the bureaucrats have the whole appropriations made available to them all in one lump, all at one time and with nothing to worry them as to how it is spent until the next fiscal year and after it and more has been spent. This is before the report of irregularities and abuses comes from the Comptroller General and only after the money is spent and gone from the Treasury.

It is the same old pattern and practice year after year with little done, not even the proverbial locking the barn door after the horse is stolen—each year the door seems to remain open for the same abuses, waste, and misspending. And after the money is gone little investigation or none at all.

While hundreds of millions of dollars of the taxpayers' money have been lost to the Government by the spending of these bureaucrats, yet many pass over such conduct by facetiously saying it is simply Yankee shrewdness doing business with the saps in the bureaus.

We should stop this year-after-year waste and spending of funds by not waiting until the moneys are actually gone, by not permitting the same people in the Government to waste the taxpayers' money, and release no further appropriations to such people in the bureaus.

I do not believe that appropriations should be paid and given to the bureaus for spending in one annual lump sum. Business concerns would be bankrupt if they gave millions of dollars for a year's operation and paid no further attention

to the spending of the moneys until the following year.

It seems that much of the abuses, misspending, and waste of the taxpayers' money, might be stopped by only paying and releasing the moneys to the bureaucrats in quarterly installments. And if the bureau does not justify its spending in the previous quarter, the next quarterly installment should be reduced and the personnel responsible separated from Government service. With such procedure, waste and misspending of the taxpayers' money might be stopped, for under the present system the bureaus can spend all that is appropriated and sometimes more.

Mr. Speaker, I believe that the quarterly release and payment of appropriations would save hundreds of millions of dollars and would be a saving to the taxpayers now, rather than investigation after the money is gone. I am introducing the following bill to make appropriations available in quarterly installments:

A bill relating to the spending and quarterly payment of appropriations for the executive branch of the Government, and for other purposes

Be it enacted, etc., That all appropriations for the use of the executive branch of the Government shall be made available for spending to each department in four quarterly installments on the 1st day of July, October, January, and April of each calendar year, and only after report to the Congress and appearance before the House Committee on Appropriations detailing the expenditures of the previous quarter by each department and its intentions for spending for the next succeeding quarter, and then made available for spending by the department in such amounts as the House Committee on Appropriations shall approve for the next succeeding quarter.

President Wilson and the League of Nations

EXTENSION OF REMARKS OF

HON. HENRY CABOT LODGE, JR.

OF MASSACHUSETTS

IN THE SENATE OF THE UNITED STATES

Friday, September 28, 1951

Mr. LODGE. Mr. President, historical evidence continues to accumulate which indicates that if President Wilson had been in his normal good health at the time of the League of Nations debate, compromises would have been reached which would have resulted in the United States joining the League of Nations. This has been a contention of mine for many years, and I naturally was very much interested to find that this belief received support in a recently published book about President Wilson's Secretary entitled "Joe Tumulty and the Wilson Era." This matter is dealt with in an editorial dated September 23, which appeared in the Worcester Telegram, and because of its historical interest I ask unanimous consent that it be printed in the Appendix of the Record.

There being no objection, the editorial was ordered to be printed in the Record, as follows:

THE WILSON ERA

Senator LODGE a few years ago said he believed that if President Wilson "had been in his normal good health, compromises would have been reached which would have resulted in the United States joining the League of Nations." That belief gets some support, at least by implication, in a recently published book, *Joe Tumulty and the Wilson Era*. The author is John Morton Blum, assistant professor of history at Massachusetts Institute of Technology. He writes:

"From October 1919 until his death Wilson was a sick man. * * * It was a wonder and a tragedy that he lived. After a month of complete inactivity he began to resume some of the duties of his office. * * * Fortunately his mind was unimpaired, but besides physical pain, arteriosclerosis brought its companion affliction of emotional instability. There is no question but that for at least a month Wilson was incapacitated within the meaning of the Constitution."

Americans at the time knew that Mr. Wilson was seriously ill, and they suspected that he was not really up to his task. But they didn't know that they were practically without a President for a while. It was a dangerous situation and it would have been even worse, if we had been in the midst of war instead of in the early part of a postwar period.

It is idle to speculate on the probable consequences of an American entry into the League of Nations in 1919-20. But we certainly know that the American rejection of the League did not promote world peace and did not keep America out of another great war.

Mr. Blum shatters the familiar Democratic complaint that the wicked Republicans killed Mr. Wilson's League for selfish, partisan reasons and so betrayed the world. He shows, by document after document, that it was Mr. Wilson's stubbornness which prevented a workable compromise on the League issue. But Mr. Blum is no carping critic. He says that Mr. Wilson at the Paris Peace Conference "aimed high and strove valiantly, everything considered, he did well, possibly none could have achieved greater justice."

Valiant he was. But he was too bitterly partisan about it; and bitter partisanship is catching. As Mr. Blum shows, both sides in the League fight were too eager to win an election. The Wilson era was a tragic one.

Farm-Policy Review: Economics or Politics?

EXTENSION OF REMARKS OF

HON. EDWARD H. JENISON

OF ILLINOIS

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. JENISON. Mr. Speaker, representative farmers in eastern Illinois have called my attention to the manner in which a branch of the Federal Government apparently has been endeavoring to create an atmosphere of apparent favor for a bureaucratic program that is not the product of the farmers themselves. Under permission granted to me by the House, I am including in the CONGRESSIONAL RECORD the resolutions adopt-

ed by 100 farmers from one of the counties I have the honor to represent, as well as a letter from a farmer in a second county, and a newspaper report of a meeting in a third county.

Sincere friends of agriculture have labored for many years to develop and support a farm policy based on economics rather than politics. Recently there has been a gigantic effort to drag the farm problem into politics, which would be a tragedy for the farmers and the country. In order that the Members of Congress may be advised of what seems to be going on in the agricultural sections of the country, I am including first a letter from an Effingham County farmer, together with the text of the resolution adopted:

SEPTEMBER 15, 1951.

Mr EDWARD H JENISON,
Congressman, Twenty-third District,
House Office Building,
Washington, D. C.

DEAR CONGRESSMAN JENISON: I am enclosing a copy of the resolutions adopted by the 100 farmers assembled recently to act upon the family farm policy review program.

The publicly stated purpose of this family farm policy review was to get the opinions of grass-root farmers but when the farmers of Effingham County expressed their opinions in resolutions with instructions that copies be sent to our United States Senators and Congressman, United States Department of Agriculture, and Dean H. P. Rusk, University of Illinois; I am informed that the State PMA office advised the county PMA chairman that he need not send copies to the above-named persons.

When an administrative department of our Government seeks to make policies, then seeks to get their approval by citizens, who have had little or no information about same, no adequate time or opportunity to study and discuss them, and they then advise against complying with a mandate from a group of citizens as expressed in resolutions, I ask, is this the type of Government policy that our boys are going through hell in Korea to defend?

Please read the resolutions enclosed. Thanks.

At the Effingham County family farm policy review held at the Effingham County Courthouse September 6, 1951, the State mobilization committee's seven-page questionnaire was not filled out but the following resolution was unanimously adopted

"Resolved by the farmers assembled in Effingham, Ill., on Thursday, September 6, 1951, at the call of the chairman of the Effingham County Agricultural Mobilization Committee for the purpose of discussing the family farm policy review, That we nor any other group or any individual are unable to correctly evaluate or render a valid decision upon any subject about which they do not have full information and then sufficient time to give it careful study. Very, very few farmers in the county have had an opportunity to read and study, or even to see, the family farm policy review provisional report and tentative recommendations. In fact, farmers were told by the chairman of the county committee that they had no copies for farmers, that they were only for members of the county committee; be it further

"Resolved, That in our opinion neither the Department of Agriculture nor any other administrative department of our Government has any authority to spend their time and taxpayers' money in surveys for policy-making purposes. Also, that an unbiased survey

and report of its own activities by any agency very rarely occurs; be it further

"Resolved, That stated in the first paragraph of the questionnaire prepared for use at this meeting, in referring to the recommendations in the provisional report, is this statement: 'In general, they involve major changes in policy or law, or major additions to the present activities of the Department and its agencies.' When only the provisional report lists the proposed major changes or major additions to the present activities of the Department and its agencies, a report that only a very few farmers ever heard of, copies are not available for farmers to read and time offered to study the many major changes and major additions proposed in its 121 pages, to study their relationship to each other, their probable effect upon all citizens and their merits under our Nation's Constitution and the basic principles upon which our Nation was founded and under which it attained its greatness, therefore it is humanly impossible for we family farmers to intelligently answer the questions listed in the questionnaire; be it further

"Resolved, That a family farm policy review should be discussed by the farm family. The call of this meeting was not addressed to the farm family, and the wording of the call gave no indication that the farm family was invited or expected to attend the meeting. No time or opportunity is provided for the farm family to read and study the provisional report and recommendations as a family and thereby arrive at a farm family decision as to their farm family answers to the questions on the family farm policy review. Therefore, any answers given to this questionnaire cannot be from the farm family, nor could their answers express their true opinions when they are not fully informed of the extent or implications of the proposed 'major changes in policy or law, or major additions to the present activities of the Department and its agencies'. be it further

"Resolved, That a copy of these resolutions be sent to the State mobilization committee in lieu of the questionnaire and that copies be made available to the press and radio and be sent to both Senators, EVERETT DIRKSEN and PAUL H. DOUGLAS, Congressman EDWARD H. JENISON, to the United States Department of Agriculture, and to Dean H. P. Rusk, at the University of Illinois"

The resolutions were unanimously adopted.

Mr. Speaker, the following is a letter expressing a similar sentiment, and coming from a farmer in Crawford county. It will be noted that the letter indicates a similar reaction to the program in neighboring Lawrence County. The letter follows:

ROBINSON, ILL., September 15, 1951.
The Honorable EDWARD H. JENISON,
Twenty-third District,
House Office Building,
Washington, D. C.

DEAR CONGRESSMAN JENISON: Last week I attended one of Mr. Brannan's farm family meetings. There were about 40 people present. After some discussion, it was moved and seconded that the meeting be postponed. The PMA chairman flatly refused to entertain a vote on the matter, saying that he had had orders from higher up not to permit a postponement. These orders were a result of Lawrence County's action in postponing their meeting.

The Congress is our only hope for curtailing the dictatorial actions of the Government agencies, and I believe that if you would check among your farm acquaintances in the other counties in your district, that you would find that this action

of Mr. Brannan's meets with the disapproval of an independent and freedom-loving people.

Mr. Speaker, when the farm-policy meeting was called for Richland County farmers at Olney, the local daily newspaper reported the result as follows:

[From the Olney (Ill.) Daily Mail of September 11, 1951]

RICHLAND FARMERS REJECT UNITED STATES FARM POLICY REVIEW

Fifty Richland County farmers demonstrated the independence for which they are famous at a meeting of the Richland County Agriculture Mobilization Committee in the court house convention hall last night.

The meeting, called to obtain a county poll in the United States Department of Agriculture's Family Farm Policy Review, developed into a rejection of the poll and a refusal to answer the 26 questions in the review.

After considerable discussion a motion was made by Harry Taylor and seconded by Ben Bohren to refute the Farm Policy Review. On a show of hands only four of the group who were not employed by the United States Department of Agriculture voted against the motion. All others voted in favor of the rejection.

The meeting was opened by Bernard Shick, Richland County chairman for the Federal PMA, who read a report of what the PMA was doing and planning to improve the farmers' lot and a report was made by Farm Advisor Edward Barnes on the history of the Farm Bureau Movement and what it has done and is doing in Richland County.

Chairman Shick then passed out the Farm Family Policy Review question sheets and asked the farmers assembled to fill the report out as he announced the 26 questions, one by one, on the poll.

After the questions had been stated, Barney Coen took the floor and said that the questions were such that he felt incapable of answering them properly in the short time allotted, and asked Mr. Shick if he and the others present could take the questionnaires home and study them and return them within a week or so. Mr. Shick stated that it was impossible as the reports had to be completed that evening so that the report could be made as a definite time limit had been set for making the report to Washington.

Mr. Coen then said that he had read in the newspapers a criticism of the poll made by the Illinois Agriculture Association, and asked if anyone had a copy of the IAA statement.

Otto Shafer said he had a copy of the letter from I. E. Paret, public relations director of the IAA and Farm Advisor Barnes was asked to read it.

The letter, which was generally published last month, condemned the poll by the Government for many reasons, including the framework of the questions, and stated that the IAA contends that the Department of Agriculture is attempting through the Farm Family Policy Review to engage in policy making rather than confining the activities of the department to its proper roll of administering the laws which Congress enacts.

The letter went on to say that "we do not believe a tax-supported governmental agency can produce an unbiased report of its activities"

"We question," the IAA statement continued, "the sincerity of top agricultural officials and others who, in such a short period of time, would seek suggestions and recommendations from all rural people on so many complicated phases of agricultural policy affecting farmers."

"We see no provisions in the program to adequately acquaint farmers prior to the meeting with the problems and policies to be discussed. While this study—Family Farm Policy Review—proposes to strengthen the position of farm families in America, it is the belief of the Illinois Agriculture Association that its intended purpose is to strengthen and expand Government agencies to the end that they become dominant and stronger with corresponding weakening of the influence of farm families in determining policy."

The IAA statement concluded that "because of the unsound procedure involved in the family farm policy review the Illinois Agricultural Association is unalterably opposed to the program and methods employed in its activation." "We believe," F. E. Morris, vice president of the IAA, said in commenting on the report, "the attempt of the Secretary of Agriculture in this so-called family farm policy review program is thoroughly political."

"It may be a 'practice run' to establish the precedent for further attempts at policy making by the USDA. It will also provide some basis for broadening the responsibility and authority of the PMA. In addition it may well afford the Secretary of Agriculture sufficient grounds for informing Congress that PMA has sampled the true thinking of farmers Nation-wide and knows what they want," Morris added.

"Among the proposals in the 121-page Family Farm Policy Review are many phases of the Brannan plan, according to IAA officials. One of these is the advocacy of direct Federal payments to farmers rather than price supports."

"Other proposals include free management service for small farms, study of legislation to permit the Federal Government to buy land, redivide it into family farms and resell, greatly expanded Federal crop insurance, and greatly expanded farm purchase and production loans."

"The Illinois Agriculture Association, which is a nongovernmental organization supported by dues from its membership, has consistently fought attempts by the United States Department of Agriculture and other Federal agencies to enter the field of determining public policy."

"The 1950 annual meeting resolutions of the IAA declared 'We also detest the growing tendency of the Department of Agriculture to impose official thinking upon the people whom they are appointed to serve and deplore the use.'

Ray Milone, Harry Taylor, Mike Flock, and Ben Bohren took the floor and spoke against the poll, stating that farmers were being rushed and pushed into answering this questionnaire without being given time to study the questions, many of which they could not understand and many of which they knew nothing about.

Harry Taylor stated that he had not marked "Yes" or "No" on any question except the Nos. 25 and 26 questions, and he had marked "No" on them. No. 25 asked, "Do you believe that the carrying on of this family farm policy review is a proper function of the Department of Agriculture?" No. 26 asked, "Do you believe that a more detailed and extended study of Department's program and policies should be undertaken?"

Ben Bohren read an article on farmers being penalized for not cooperating on liming, and said that they are nearing socialism when they tell us what we can plant and do, and it was time to call a halt to this program which we pay for anyway as taxpayers.

Barney Coen, in a concluding statement, told Mr. Shick that the action and attitude of the group was no reflection on him and others who worked with PMA, and that they were attempting to do a good job for Richland County farmers despite orders from higher up. A general consensus of those

present agreed with Mr. Coen's statement regarding Mr. Shick and the other Richland County PMA workers.

Several of the speakers expressed the farmers' need for Federal help in many ways, especially on advice, crop reports, certain types of fair support, etc., but that dictatorial and political policies were what the farmers opposed.

The "peaceful revolt" last night is similar to the action taken by farmers in many other counties in Illinois, where the Illinois Agricultural Association's condemnation of the United States Department of Agriculture's political methods has been followed.

Mr. Speaker, it would seem apparent from the reaction of the farmers themselves that they resent such an obvious political intrusion into the farm problem by an agency of the Federal Government. Discussion of the farm problem at the farm level is sound procedure, but the farmers are right when they protest being called together to give rubber-stamp approval to a preconceived plan. The farmers may take heart in the fact that the Congress will look to them, and to their farm organizations, for counsel on the farm program and not to any group of farm politicians seeking to perpetuate themselves in power.

Oil and Aluminum in the Defense Program

EXTENSION OF REMARKS

OF

HON. F. EDWARD HÉBERT

OF LOUISIANA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. HÉBERT. Mr. Speaker, the Nation has been saturated with the pleas of certain segments of our population for a proper and adequate defense for the protection of our national security. A vocal segment of the Nation has tried to arouse the apathetic segment to action. The success of this attempt is still rather in doubt but there is one thing not in doubt, and that is the sophistry of a part of the vocal segment which is shouting defense of the Nation from the roof tops.

There are those who demand adequate defense of the Nation as a means of political gain and as a ruse for the further socialism of the country and the destruction of constitutional government.

This is a general charge but I back it up with two specific instances which I submit for your consideration.

Strange enough, the Department of the Interior is involved in both instances.

In one instance it is the demand for oil and in the other the demand for aluminum, but both demands are made in the name of defense which is the popular theme song of the moment and the most appealing to an unsuspecting citizenry, which, unfortunately, remains too apathetic or disinterested to examine the record and prefers to accept catch phrases as substitute for logic.

Take the case of oil for instance.

We are told that oil is necessary in the national defense and who can deny such a statement.

We are told that millions of barrels of oil are to be found under the tidelands of Louisiana, California, and Texas.

We are told that this oil is necessary for our defense but the oil cannot be produced unless the tidelands are stolen from the States and handed over to the Federal Government which has no right to them but all this must be done in the name of defense.

We are told that litigation instituted by the several States is holding up the production of this oil and naturally those who do not know the facts are convinced that the States and the House of Representatives, which shares the belief that the tidelands belongs properly to the States, are interfering with the defense program. But, in truth and fact, are they?

We are not told that the litigation could be easily eliminated by the Department of Interior acknowledging that the tidelands belongs to the States.

We are not told that if the President had not previously vetoed legislative clearance of the title of the tidelands to States, there would have been no interruption in the defense program as far as the production of oil is concerned.

The American people are not told these things because such honesty would completely remove any reason, by whatever yardstick, for the theft of the tidelands and defiance of State sovereignty.

The New Orleans States, in another splendid editorial, again rings the welkin and tears away the mask of hypocrisy from the faces of those who would cry "defense" from their throats and simultaneously shackle defense with their hands.

Who is really guilty of hampering the defense program?

Who is really the guilty party?

Read this editorial from the New Orleans States very carefully and there will not be any doubt in your minds:

OIL AND ALUMINUM

Among the materials vitally needed for defense purposes, oil and aluminum rank near the top.

The demand for these two items is insatiable at this time, while the Nation is building planes, ships, and all types of armament to defend itself if global war should come, and to demonstrate such strength that our enemies would hesitate to provoke a global war.

It would seem, then, that a major piece of business of the Government in Washington would be to boost oil and aluminum production.

But—as unrealistic as it is—one of the administration's chief officials concerned with the production of oil and aluminum is responsible for a curtailment of their output instead of a boosting of it.

He is Secretary of Interior Chapman.

This newspaper on previous occasions has discussed separately his activities in the oil situation and in the aluminum situation. Because of the great importance of oil and aluminum in the present defense picture, we think the public should be aware that Mr. Chapman had a hand in throttling both of these essential materials.

Thousands of barrels more of oil would be available from known wells in the offshore deposits of the Gulf of Mexico if Mr. Chapman's department would choose to issue, instead of refuse, drilling permits to companies prepared to continue operations that

have been halted by the federally instigated tidelands controversy.

The Interior Department was able to issue a drilling permit to one oil company in the offshore area on the excuse that drilling was necessary to prevent wastage. Why couldn't more permits be issued on the excuse that the defense effort needs oil?

In the aluminum field, five plants fed by cheap hydroelectricity from tax-free, tax-supported Federal plants in the Pacific Northwest have had to cut production drastically because of a power shortage caused by drought. The Interior Department has encouraged the location of those plants in the Northwest. Mr. Chapman even went so far as to stretch the standards by which the availability of power is measured so that the Aluminum Co. of America could be enticed to locate in the Northwest instead of New Orleans.

Until Mr. Chapman changed the standards, the availability of power had been estimated on the basis of worst year of drought in the Northwest region. The change was made to the median year—which had the effect of boosting the estimate of power available. On the basis of the new estimate, there was room for more industry in the Northwest.

But 6 months after Alcoa had been lured to the Northwest, the median year estimate proved unsound. A drought considerably worse than the median cut short the water supply. Defense Mobilizer Charles E. Wilson is talking now about a possible shift of some of the aluminum plants to other areas.

We don't see how our defense effort has a chance to succeed if officials like Mr. Chapman help to shape its course. His department can take credit for putting a dent in the oil and aluminum supply.

Mr. Speaker, now there is the question of aluminum in national defense.

The production of aluminum is tied up with the question of public power. That is where the catch is.

It takes power and plenty of it to produce aluminum. There is plenty power available, especially in Louisiana, for the production of aluminum, but unfortunately, Louisiana offers power from private enterprise and not Government subsidy. Those in power in this administration are dedicated to a vast public-power program to the destruction of private enterprise.

So what happens?

A deliberate shortage of public power is created in order to build up a demand for public power under the guise of national defense.

Some months ago when the Alcoa people were supposed to be looking around in various parts of the country for a site to establish an aluminum plant, the people of Louisiana came forward with a sincere desire for cooperation and made every effort to interest the Alcoa people. At that time I had no reason to challenge the sincerity of Alcoa. I have learned much since.

At that time it was pointed out by me on this floor of the plot of the Department of the Interior to compel the Alcoa Co. to go to the Pacific Northwest through a tender of cheaper power through the devious channels of public power which is the admitted forerunner of socialization of our national industries. I believed then that Alcoa was strong enough to resist such pressure and would not become part of the scheme.

It is a tragedy, and not an exceptional one, that where an economic advantage

is offered private enterprise, private enterprise succumbs to the temptation and turns its back upon the very people who fight the battle of private enterprise.

That is the way it was with Alcoa. They wanted to go to Louisiana as long as the Government did not offer cheaper power at public expense. Alcoa was a strong advocate of private enterprise and the principles of a free economic system as long as Alcoa could not get its own foot in the door of socialized public power, for which the people of this country pay for in the form of taxation. The result was that Alcoa, after making sugary apologies to the people of Louisiana, and meaningless promises to review the Louisiana situation, raced to the Pacific Northwest to grab the Government subsidized power to its own benefit.

It was all for defense.

It was for defense alright, but not for national defense. It was for the defense and protection of those who would march us down the road to socialism and are doing it with the aid of private enterprise itself.

The inevitable happened.

The production of aluminum today is stalemated because of lack of power in the Pacific Northwest.

Today there is no power and there is therefore no aluminum.

I find no solace or consolation in being able to say "I told you so" but I do find a burning desire within me to continue the fight of free enterprise against socialism in government and to continue to bring to your attention such virile editorials as the one to which I now invite your attention from the pages of the New Orleans States:

DROUGHT SHORT CIRCUITS THE BUREAUCRATS

Do you remember how the Federal Government lured a proposed \$45,000,000 aluminum plant from New Orleans to the Pacific Northwest with below-cost electric power as bait?

That was last March. The Aluminum Co. of America was looking at the natural advantages of New Orleans in picking a site for their plant—those same advantages which had just attracted to this area a \$79,000,000 Kaiser Corp. aluminum plant.

Quite probably the Alcoa Co. would have come to this area, just as Kaiser did, except that the Federal Government, through its Department of Interior, went out of its way to provide the Pacific Northwest with an arbitrary advantage that outweighed the natural advantages of New Orleans.

That was electric power from the tax-free federally sponsored Columbia River power system at a rate below that which can be obtained from taxpaying private sources here.

In order to offer this cheap-power bait to Alcoa, Secretary of the Interior Chapman had to strain the hydroelectric facilities that were already serving a large collection of essential industries in the Northwest.

Part of the supply for the Alcoa plant was to be 60,000 kilowatts of interruptible power—that power which could be cut off in time of drought—from the Bonneville Dam.

At the time that the tug of war for the Alcoa plant was going on between the Northwest area and the New Orleans area, reporter James Free, of the New Orleans States' Washington bureau wrote:

"Until recently, the Interior Department—figuring potential Bonneville power on the basis of worst year in the past—had stated that no additional power was available there for defense projects.

"Chapman, noting that there have been 20 normal or median years out of the past 26 years at Bonneville, changed the standard of availability from a base of the worst year to the median year.

"And, on this new basis, Chapman found that the interruptible power could be made available for defense plants."

In other words, Mr. Chapman changed the rules so as to favor the Pacific Northwest. This newspaper was critical of his tactics, of the unfairness of the Federal Government being in business in competition with private enterprise, and of the arbitrary discrimination against the natural advantages of New Orleans.

Now it develops that we and the defense-minded people of this Nation could be critical on another serious score. Mr. Chapman's stretching of the availability standards—changing the base from "worst" year to "median" year has already proven to be unsound as well as unfair. The drought of the past few months has drastically reduced water in the streams on which the hydroelectric plants are located. No water means no electricity.

The Wall Street Journal recently reported that a 245,000-kilowatt cut-back was ordered by the Bonneville Power Administration. That constituted its entire interruptible load. Affected by that cut-off are three aluminum companies—including Alcoa—whose five plants produce about 50 percent of the Nation's light metal.

Ironically, the Bonneville Administrator was reported in the Wall Street Journal to be considering buying steam power to substitute for the hydroelectric shortage. In that area, industrial users of Government power pay 2 mills per kilowatt. Steam-made power will cost from 8 to 10 mills, even up to 15 mills per kilowatt.

The steam-generated power that was offered by private enterprise in the New Orleans area would have cost Alcoa 3 or 4 mills per kilowatt, thanks to the abundance of natural gas in these parts to make steam.

The bureaucrats who have been concentrating aluminum and other essential defense plants in the Northwest without proper regard to the limitations of the hydroelectric power supply are responsible for a set-back in defense production at a time when it is vitally needed.

A Bold Policy for Peace

EXTENSION OF REMARKS OF

HON. JACOB K. JAVITS

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 13, 1951

Mr. JAVITS. Mr. Speaker, under leave granted to extend my remarks in the Record, I include the following article by Dewey Anderson, executive director, Public Affairs Institute:

A BOLD POLICY FOR PEACE

(By Dewey Anderson, executive director, Public Affairs Institute)

In doing the twofold job of preparing adequate defense and negotiating for peaceful solutions of world problems, America needs the guidance of a great declaration of purpose. It must state our aims clearly and challengingly enough to appeal to all people everywhere.

Fundamentally, our purpose should be that of bringing about a necessary and peaceful change in the conditions and hopes of men throughout the world. This is in

the great liberating tradition of our country. The peaceful revolution in the American process of liberation is too little known or felt in the world today. It should be given a chance to reshape the character of men and events everywhere as it is doing at home. It is more needed today than ever before.

In order that the constructive and dynamic forces of our American achievement may become effective in the affairs of nations, we call for a new American policy in the world today. We call for a truer and more adequate expression of our deep longing for peace and our belief in freedom and human dignity. We must make it clear that our necessarily great rearmament does not blind us to the need for economic and political aid to others.

Specifically, such a new United States policy should make several things clear to the people of the world, and thereby bolster their faith in our sincerity and strengthen their will for cooperation and the peaceful adjustment of differences. These things are:

1. That the American people realize that peace and freedom cannot forever survive want and hunger. We know that men must eat before they can even dream of freedom, and that without food and freedom there can be no good hope for peace among men. We therefore accept the obligation of devoting a considerable part of our daily earnings to help other people start on their march toward freedom from want. We ask only that this contribution be used effectively for those who need it most.

2. That the American people seek no control of other governments or destinies. We repudiate any efforts to use the contribution of the American people for such purposes. In evidence of our good faith we offer all this portion of our daily bread, in whatever form it is given, for distribution through the United Nations, and not through agencies of our own Government. In further evidence we offer to share this contribution with people whose governments are antagonistic to our own Government.

3. That the American people can always be counted on to help our fellow men achieve political independence. This tradition is evident in our recent efforts on behalf of the people of India, the Philippines, and Indonesia. We are aware, too, that independence is not enough; we are interested in helping other people obtain, in addition to political independence, those conditions of security and economic improvement upon which both their national independence and their individual freedom must rest.

4. That the American people believe in the United Nations and want it to be strengthened. We believe the U. N. holds the world's best hope for resisting aggression, obtaining peace, and bringing economic strength and progress to all. So that this world organization may truly represent all the people of the world we ask for a return to the Jeffersonian principle of recognition by the United States of all Governments in actual power. We find that the new American doctrine of non-recognition has unnecessarily increased world tension, has aroused improper expectations that American recognition automatically brings financial aid, and has created an incorrect and unfortunate impression that our aim is world control. We believe that all governments which pledge themselves to the U. N. Charter should be admitted to membership in that organization.

5. That our fellow men are dealing at all times with an American people and an American Government dedicated to peace. We want them to know this particularly in these times, when great military burdens are being laid upon them and upon us, and when irresponsible individuals in and out of our Government are discussing preventive war.

We want them to know that the American people are in control of their own Govern-

ment. That they desire to be friends with all people, including those in Russia and China. That they do not want another world war. That present military preparations were called forth only by the Communist aggression in Korea. That those preparations are, and always will be, solely for resistance to aggression. That the moment our fears of further aggression are ended, if they can ever be, the American people will insist on world disarmament in all types of weapons.

We call for the revision in present policy which will accomplish these five objectives. We deeply believe that there can be unity among the peoples of the world, especially if America is allowed to contribute the human values and dynamic forces it has developed.

Michael Straus and Company Plot To Destroy Reclamation Groups

EXTENSION OF REMARKS OF

HON. NORRIS POULSON

OF CALIFORNIA

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 20, 1951

Mr. POULSON. Mr. Speaker, during the recent Central Valley celebration in California, it became apparent that the Bureau of Reclamation has marked for destruction two leading western reclamation organizations.

These are the National Reclamation Association and the Irrigation Districts Association of California, two reputable groups comprised largely of distinguished reclamationists, engineers, attorneys, and farmers who believe that enterprise is a means of protecting and developing western economy, and not a tool for creating a socialistic state.

Even before Reclamation Commissioner Straus and Interior Secretary Chapman traipsed out to California last August to spout their own greatness, and to discredit westerners who were honestly deserving of public approbation, they had planned to sabotage the NRA and the IDA.

Their forthcoming assault will be directed especially at certain officials of these associations who have dared to suggest that Mike Straus is not the greatest living American capable of tying his own shoes. Nobody dares to defy or criticize Mike Straus, not even his boss, Oscar Chapman, and for their heresy these reclamation association officials will be the subject of concentrated smears spewed out by the Bureau's infamous propaganda machine.

A clear indication of the approaching Bureau purge was witnessed at the Straus (Michael) festival in the Central Valley. In commemorating the opening of this great development, it would have been merely ordinary politeness to invite the founders and original planners of the project. But this did not happen.

Mike Straus handled the invitations, and he omitted the westerners who began the Central Valley project before he was born. If any of these pioneers attended at all, they stood in the crowd, ignored by the bright Interior Depart-

ment boys basking in the spotlight on the speaker's platform.

Hearing Mike Straus and company there, one would have thought they not only discovered irrigation, but personally produced the water.

In addition to keeping out the engineers and State and National officials who conceived the Central Valley project, Mike Straus saw to it that his critics in the NRA and IDA were not permitted to participate in the festivities through the medium of official invitations.

Uninvited to the main ceremony, held at Tracy, were:

Charles L. Kaupke, California director of NRA and an officer of IDA.

Philip A. Gordon, president of IDA.

Abner M. Crowell, vice president of IDA.

Judge J. E. Sturrock, a vice president of NRA.

Other officials of both organizations were similarly ostracized, but Mike Straus had his sights trained particularly on the four mentioned.

Art Cramer was the general manager of the Tracy celebration, and he submitted the names of Kaupke, Gordon, and Crowell to the Bureau as being among the important guests to be invited. Mike Straus eliminated their names.

The case of Judge Sturrock, who is from Texas, is a special one. The judge, who has fought for honesty in reclamation, has for some time been marked for slaughter by the Bureau. Mike Straus issued the condemnation order. As he now operates, Straus cannot afford to have his hand exposed by reclamationists who believe that projects should be somewhat feasible, both as to engineering and cost.

The NRA will hold its annual convention in Amarillo, Tex., October 17, and some time ago a committee appeared at Mike Straus' Washington office to extend to him a courteous invitation to the convention. Perhaps it was the word "Texas" which made Mike Straus see red, for Texas is where Judge Sturrock lives. At any rate, Straus' own courtesy, if any, left him, and he took the occasion to shout out a personal diatribe on Judge Sturrock. The NRA committee left in disgust.

The NRA members come from 17 Western States, and it so happens that these are the same 17 States in which Mike Straus wants to be supreme dictator. If he and his Bureau can gain control of the water and power in these States, their is no doubt he will be their Stalin. Irrigation water and hydroelectric power are the life-blood in about 90 percent of this vast area.

The absurdity of Straus' snub to Kaupke, Gordon, and Crowell becomes more obvious when you consider that the IDA itself covers more than 4,500,000 acres in California alone, while in all the 17 reclamation States the Bureau projects cover only about 5,000,000 acres. In addition to absurdity, the ostracism of these three men, and other officials of both associations, reveals Mike Straus' true motive, which is the destruction of them and their organizations.

Straus could not very well eliminate Harry E. Polk, president of the NRA,

from the California shindig. He would have done it, no doubt, had not his own advisers reminded him that he had not yet quite achieved the position of supreme dictator.

But Straus has plans for Polk, too. The essence of them is to relegate Polk to oblivion. For several years Polk has stood with NRA members who had the conscience and the courage to criticize the malpractices and confiscatory tactics of the Bureau. Straus made a strenuous effort to oust Polk from the presidency last year, and he will stage a repeat performance in Amarillo.

The man Straus wants as president of NRA is Clifford H. Stone, an erstwhile justice of the peace and pseudo-reclamationist, from Colorado. Stone is completely a vassal of Straus, and barks happily at sight of him. If Stone should become president of NRA, Straus would have virtual control of it.

Polk, Sturrock, Kaupke, and other leaders of NRA are fully aware of Straus' scheme, and they are not going to be bludgeoned into submission. That would be tantamount to selling out their own people, their associations, and their States to a group of rogues who are bent on destroying all free enterprise in the West.

Straus and his socialistic conspirators are pursuing a course of divide and conquer to accomplish one of two objectives: First, bring about a drastic change in the administration of NRA which will assure its complete subservience to the Bureau of Reclamation; or, second, wreck the NRA completely. Needless to say, Straus prefers the latter.

The showdown will come in Amarillo, for Straus accepted the NRA invitation and will be on hand with a score of his stooges, all traveling at taxpayers' expense. The Bureau propaganda which will flood Amarillo will all be aimed at wrecking NRA and making Straus the king of western economy.

But Polk, Kaupke, and Sturrock will be there, too. They do not need an invitation from Straus to attend.

Common Sense, Please

EXTENSION OF REMARKS OF

HON. LAWRENCE H. SMITH

OF WISCONSIN

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. SMITH of Wisconsin. Mr. Speaker, under leave to extend my remarks, I am including an article by Father James Gillis, entitled "A Little Common Sense, Please." It is an article which should be read by all Members of the House.

A LITTLE COMMON SENSE, PLEASE
(By Father James Gillis, C. S. P.)

The American citizen has a right to expect of his Government a certain degree of wisdom and enlightened self-interest in its dealings with the rest of the world. That expectation has in recent years been again and again disappointed. So perhaps we shall have to lessen our demands and ask merely for a little common sense.

Of high statesmanship we have none. In the game of diplomacy we are outclassed. But the very least we can ask is that in our dealings with other nations we shall not act like simpletons. We—that is to say those who acted for us—blundered at Tehran, Yalta, and Potsdam. They seem not to have known the rudiments of horse trading, not to say of the delicate and difficult science and art of diplomatic negotiation. As one acute observer said at Yalta, "We had all the cards in our hands but we threw them away." Why? Is there some cryptic merit in being asinine?

We seem to come out second best or even last in every contest with the diplomats and propagandists not only of our enemies but of our allies. England, for example, is financially broke and politically a has-been; but she still tells us what to do and in almost every case we do it. We have neither the nerve nor the sense to tell her to stop trading with Soviet China while we are fighting Soviet China.

We seem to be playing a diplomatic comedy—or even a farce—and everyone at or near the top of the Government seems anxious to get into the act. For example, when the San Francisco conference was about to meet, Associate Justice William O. Douglas of the Supreme Court came up with the suggestion that the United States should recognize Red China. Everybody knew that Gromyko was coming with orders from the Kremlin to throw a monkey wrench into the machinery of the conference.

So a Justice of the Supreme Court of the land hands him the implement. The reason alleged by Mr. Justice Douglas was that to recognize Red China would be to produce a rift between Red China and Red Russia. But on the very day that curious piece of strategy was proposed, a message from Mao to Stalin was published in which the Chinese dictator tumbled all over himself in adulation of the demigod in Moscow.

At any rate, why should so exalted a personage as a Supreme Court Justice, presumably aloof from politics and diplomacy, intrude in the business of the Department of State? Has the constitutional and traditional repugnance of the judiciary from the executive been relegated to innocuous desuetude?

On the very day of the opening of the conference, Senator CAIN, of Washington, threatened to introduce a resolution to the effect that the treaty of peace with Japan (6 years late, by the way) would not be ratified by the Senate if it provided for the cession of any territory to a nation that refuses to sign the treaty. That nation, of course, is Russia. The treaty read that Japan "renounces all right, title, and claim" to the Kurile Islands and the southern half of Sakhalin. But the joke—Russian joke—is that since the end of the war Russia has been occupying these two strategic points (described by the Senator as "daggers pointed at our defense of the Pacific"). Possession is nine points in the law. Would the Senator suggest that we go into the Kuriles and Sakhalin and push Russia out? It was with our consent and connivance that she moved in. Shall we tell her that what we did 6 years ago is now to be undone?

To continue with the news of the day of the opening of the peace treaty conference. There was an item in the papers informing us that while the other conference—the cease-fire conference in Korea then in its eighth week—was still dragging along without success and apparently without hope, the Reds had gathered 5,000 planes in Manchuria. General Ridgway himself set the figure at 1,000. One thousand or 500, was that what the Korean and Chinese Reds had in mind when they concocted the notion of a cease-fire conference?

What has got into us? Are we deliberately playing the part of imbeciles? Who is direct-

ing these crazy maneuvers that make us the laughing stock of the world? Again I ask, if we cannot get high statesmanship, is it too much to hope for just a teeny-weeny bit of common sense?

Let us have one more sample of our blundering. During the congressional investigation of the recall of General MacArthur, Senator BRACES produced a document dated April 21, 1945, a report of a group of specialists in the War Department under Colonel Michela. It contains 12 conclusions and a recommendation. Among the 12 conclusions were these:

"The United States should make no political or economic concession to Soviet Russia."

"The entry of Soviet Russia into the Asiatic War would destroy America's position in Asia."

"It should be reiterated that the United States Army is by no means united in believing it wise to encourage the Soviet Union into the Asiatic war."

If those warnings had been heeded we should not be in our present predicament. The military men were wiser than the statesmen. But why were the statesmen so stupid as not to see what everyone else, soldiers, civilians, professionals, and amateurs knew perfectly well? Has some order gone out from somewhere that our foreign policy must be in all cases contrary to common sense? What is at the bottom of all this? Can it be that there are traitors in our midst?

Freedom Under God

EXTENSION OF REMARKS

OF

HON. NORRIS POULSON

OF CALIFORNIA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 18, 1951

Mr. POULSON. Mr. Speaker, I am inserting in the RECORD a sermon which was awarded first place in the 1951 spiritual mobilization sermon contest. It was preached by Rev. Kenneth W. Sollitt, minister of the First Baptist Church in Mendota, Ill., on July 1, 1951:

FREEDOM UNDER GOD—WE CAN GO ON MAKING A GOD OF GOVERNMENT, OR WE CAN RETURN AGAIN TO THE GOVERNMENT OF GOD

In 1776 John Adams wrote the following letter to his wife:

"The 2d day of July 1776, will be the most memorable epoch in the history of America. I am apt to believe that it will be celebrated by succeeding generations as the great anniversary festival. It ought to be commemorated as the day of deliverance by solemn acts of devotion to God Almighty. It ought to be solemnized with pomp and parade, with shows, games, sports, bells, bonfires and illuminations, from one end of this continent to the other, from this time forward forevermore. * * * I am well aware of the toll and blood and treasure that it will cost us to maintain this Declaration, and support and defend these States. Yet through all the gloom I can see the rays of ravishing light and glory. I can see that the end is more than worth all the means; and that posterity will triumph in this day's transaction."

John Adams' words were prophetic. Patriotism has triumphed in this day's transaction. The anniversary of the signing of the Declaration of Independence for 175 years has been to loyal Americans the great anniversary festival. It is still being commemorated as the day of deliverance.

PROCLAIM LIBERTY THROUGHOUT THE LAND

The Declaration of Independence was preceded on June 7 by a resolution presented

to Congress by Richard Henry Lee, of the Virginia delegation. It read:

"Be it resolved, That these United Colonies are, and of a right ought to be, free and independent States. That they are absolved from all allegiance to the British Crown; that all political connection between them and Great Britain is, and ought to be totally absolved."

The resolution was debated. A committee of which Thomas Jefferson was the guiding spirit drew up the Declaration of Independence. It was signed by delegates from all the colonies except one on July 2, the date to which Adams referred in his letter, and finally acted upon on July 4. Up in the steeple of the statehouse the old bell ringer had waited all morning to ring the Liberty Bell if Congress should adopt the Declaration. Finally the news reached his ears and he rang the bell on which more than 20 years before had been engraved the words from Leviticus 25: 10 "Proclaim liberty throughout the land and to the inhabitants thereof."

A LOW ESS OF FREEDOM

On this one hundred and seventy-fifth anniversary the faint echoes of that bell awaken in the hearts of every loyal American responsive chords. We are a freedom-loving people. At least we think we are. We are sure not to want to do anything we are told to do and to want to do everything we are told not to do. We simply do not want to be told because we love our liberty. We spend more than any nation in the world to pass laws, more than any nation in the world to enforce laws, and more than any nation in the world to break the laws we have paid to have passed and enforced, because somehow we like to think of those laws as having been made for the other fellow.

But freedom loving as we think we are, 175 years after the signing of the Declaration of Independence we have less freedom than we have ever had in our history. Why? What is happening to the descendants of Hancock, Adams, Jefferson, and Patrick Henry? Can it be that the illusion that we could restrict the freedom of others and at the same time increase our own was the beginning of the end of freedom for America?

Our forefathers believed and acted upon the belief that, as Samuel Webster put it in 1776: "The true design of civil government is to protect men in the enjoyment of liberty." For 175 years we have focused our attention so much on "the enjoyment of our liberty" that we have been perfectly willing to pass all kinds of legislation limiting the other fellow's liberty for our benefit. The old melting pot that was America has become a pressure cooker. "Government of the people, by the people, for the people" has become Government of the people by pressure groups for the benefit of minorities. "Give me liberty or give me death" has been shortened to just plain "Give me." We have not seen that Government cannot give us what it does not first take from us, that a Government strong enough to give us everything we want is a Government strong enough to take from us everything we have, and that in the process of taking away and giving back we have built up a vast expensive bureaucracy which threatens to wreck our national economy. During March and April of this year 53,500 civilians were added to the Federal payroll. That is more than 1,000 persons per day for each business day of the 2 months. In 1950 the national debt reached \$1,865 per man, woman, and child in our country, or a total approaching the assessed valuation of all of our property.

FAMILIAR FLOWERS

I was in a small hotel in Vermont one day when one of the guests, a foreigner unfamiliar with our American ways, brought the proprietress of the inn a beautiful bouquet

of flowers. The proprietress of the inn was delighted beyond words—until she discovered that her gallant and thoughtful guest had picked the flowers out of the garden in back of the inn. Whenever the Government hands you a bouquet you can be perfectly sure that it was picked out of your own garden. But we go right on accepting the bouquets in the vain hope that some day we will gather flowers that somebody else planted and brought to bloom. Why have we lost our cherished freedom? Because we have sought freedom man's way instead of God's. We have forgotten that "Our fathers' God" is the "author of liberty." Jefferson just made out the order for it.

"ME-FIRST-ITIS"

America has a bad case of "me-first-itis." We have wanted freedom, as we have wanted everything else, for ourselves as individuals instead of for all Americans. We have wanted freedom, but not freedom under God. Yet freedom under God is the only real freedom there is.

There is a difference between freedom as conceived by the person who wants something for himself or his immediate friends at the expense of others, and freedom under God as conceived by the founders of this Nation.

In 1876 when throughout the Nation America celebrated the one hundredth anniversary of the signing of the Declaration of Independence, an Episcopal clergyman, the Reverend Daniel C. Roberts, of Brandon, Vt., wrote a prayer hymn which was sung for the first time on the Brandon, Vt., village green. That hymn took account of the fact that God cannot be left out of our thinking with regard to our liberties, or there will be no liberty for any of us. We are free men and women only as we seek our freedom according to the laws which He has laid down for His children to follow. This is what we mean by freedom under God being the only real freedom. It is a fact which we have tended to forget in recent years. But when we try to nullify God's laws, either as individuals or as a nation, we break, not the laws, but ourselves. Realizing this, we ought to begin the road back to freedom by praying with the author of this hymn:

"God of our fathers, whose almighty hand
Leads forth in beauty all the starry band
Of shining worlds, in splendor through the
skies,

Our grateful songs before Thy throne arise.

Thy love divine hath led us in the past;
In this free land by Thee our lot is cast;
Be Thou our Ruler, Guardian, Guide, and
Stay,

Thy word our law, Thy paths our chosen
way."

Then, if God's word is to be our law and His paths our chosen way to freedom, there are four principles of freedom inherent in the universe as God has created it which we need to know and understand:

First, let us understand that freedom is never liberty to do as we please; it is only the right to do as we ought.

We are all familiar with the story of the Good Samaritan. One of the characters in that story interpreted freedom thus: He looked upon a man who had something he wanted and said, "What he has is mine and I am free to take it." This is the philosophy of thieves, lobbyists, seekers after special privilege, and all who think that the world owes them a living. The priest and the Levite passed by and interpreted freedom in these terms: "What I have is mine and I am free to keep it." This is the philosophy of all selfish souls. But the Samaritan came by saying in his heart, "What I have is God's and I am free to share it." Each man inter-

preted freedom differently but only he who did what he knew he ought was really free.

We are not told the ultimate end of these different characters. Doubtless the thief was apprehended and his freedom taken from him. The priest and the Levite became the slaves of their own selfishness. They probably died of stomach ulcers and likely few people attended their respective funerals. The Samaritan only was a freeman.

THE GOOD SAMARITAN IS OBSOLETE

Of course the Samaritan was old fashioned. By today's standards he should have let the man die by the side of the road while he telegraphed to Washington for Federal aid. He should have written to his congressman in Jerusalem saying, "Our district is badly in need of a new 'Good Samaritan Hospital' to be built along the road between Jerusalem and Jericho. I suggest that it be financed by a special tax on thieves, priests, and Levites. On second thought, you better exempt the priests for obvious political reasons." And it might be that in the course of time his congressman would get him the hospital—plus an expensive BHBE (that is Government shorthand for Bureau of Hospital Building and Equipment)—plus socialized medicine—plus new and bigger tax bills each year, taxes which the thief would not pay, from which the priest would be exempt, out of which the Levite would crawl through some legal loophole, leaving the full burden on the shoulders of the Samaritan and the stockholders of the Good Samaritan Oil Co. of Jericho. Then nobody would be free, even to do what he ought, for the only person disposed to do what he ought would be impoverished by excessive taxation. Only the congressman would benefit. He would be re-elected by a grateful constituency for giving them a "free" hospital.

FREEDOM IS COMMINGLED WITH RESPONSIBILITY

That is our situation today. We have passed laws and set up bureaus until we are no longer free even to do what we ought. For example, we ought to make money in our businesses. As one of our labor leaders once said, "The one unpardonable sin of management is not to make money." for labor can make money only when management does. But for a business to make money today amid all the tinkering with our economic system that is going on is not easy. We ought to provide for our old age so we will not need to be a burden to society. But who can save these days? And even those who are able to buy bonds and pay insurance premiums or have pensions find that their money, when they get it, is worth less than half what it was when they put it away. In fact, if we want to be free men and women, we ought to control our financial destiny instead of placing it in the hands of politicians who became politicians after becoming business failures.

Secondly, we need to understand that all rights imply corresponding responsibilities. The right of a city to have a pure water supply implies the responsibility on the part of the citizens of that city not to drown cats in the reservoir. The right of police protection is dependent upon keeping the police incorruptible. If you can bribe them, so can those who would do you harm. The right of good government is dependent upon the responsibility of good citizens at the polls, for bad officials are always elected by good voters who do not vote. The right to be a free people depends on the willingness of the people to assume the responsibilities of freedom. There is no such thing as pure freedom. Freedom is always commingled with responsibility.

This brings us to the third thing which we must understand about freedom as God has ordained it: If we will not assume the responsibilities of freedom, we shall be de-

prived of the privileges of freedom. There must be control in any society. Those who will not control themselves must be controlled by others. If we will not assume the responsibilities of self-government, there are always those who will govern us for their own ends.

Finally, our only real freedom then lies in our ability to choose our own masters. If we say we will have no master, someone must inevitably master us. That is the lot of thieves and anarchists. If we say we will have no master but our own selfish interests, we become the slaves of our own selfishness, like the priest and the Levite. If in our selfishness we go so far as to demand of the state that it solve all of our problems, make all our decisions, provide us cradle-to-the-grave security, and be a god to us, then we have chosen for ourselves complete and abject slavery. We have no freedom under God.

It all adds up to what Paul said in his second letter to the church at Corinth (II Corinthians III: 17): "Where the spirit of the Lord is, there is liberty." Liberty is where the spirit of the Lord is and nowhere else. There are not two ways to freedom, only one, and that is God's way.

Paul is here contrasting the multiplicity of rules and regulations which had become the shackles of Judaism, with the joyous spirit of free people who had but one master, the spirit of the living God. Freely they had chosen the Lord. Joyously they followed him, not because they had to, but because they wanted to. And always He led them in the free air to green pastures and in the paths of peace beside still waters. The multiplicity of laws was forgotten and a few principles of abundant living like the Beatitudes and the Golden Rule were adopted in their stead. They walked in the spirit of the Lord and where the spirit of the Lord was they found liberty.

A GOD OF GOVERNMENT OR A GOVERNMENT OF GOD

Today America stands at the crossroads. There are but two ways for us to go. We can go on making a god of government, or we can return again to the government of God. The one road leads to the slavery which has always been the lot of those who have chosen collectivism in any of its forms, communism, socialism, the welfare state—they are all cut after the same pattern. The other road leads to the only freedom that there is.

"Blest is the nation whose God is the Lord," for "where the spirit of the Lord is, there is liberty." But "choose ye this day whom ye will serve, * * * As for me and my house, we will serve the Lord."

"O Lord, our God, Thy mighty hand
Hath made our country free;
From all her broad and happy land
May worship rise to Thee.
Fulfill the promise of her youth,
Her liberty defend,
By law and order, love and truth,
America, befriend!"

"O suffer not her feet to stray;
But guide her untaught might,
That she may walk in peaceful day,
And lead the world in light.
Bring down the proud, lift up the poor,
Unequal ways amend,
By justice Nation-wide and sure
America, befriend!"

"Through all the waiting world proclaim
Her gospel of good-will,
And may the joy of Jesus' name
In every bosom thrill.
O'er hill and vale, from sea to sea,
Thy holy reign extend;
By faith, and hope, and charity,
America, befriend!"

Workers Have Most to Lose

EXTENSION OF REMARKS

OF

HON. ZALES N. ECTON

OF MONTANA

IN THE SENATE OF THE UNITED STATES

Friday, September 28, 1951

Mr. ECTON. Mr. President, I ask unanimous consent to have printed in the RECORD an article entitled "Workers Have Most To Lose," written by David Lawrence and published in the Washington Star today.

There being no objection, the article was ordered to be printed in the RECORD, as follows:

WORKERS HAVE MOST TO LOSE—LEFT WING HAS FOLLOWED CONSISTENT PATTERN OVER THE YEARS DESIGNED TO HELP MONOPOLIES AND LARGER BUSINESSES

(By David Lawrence)

It's a curious commentary on the handling of tax legislation that, whenever a revenue bill is under consideration, the left wing is found striving for higher and higher excess-profits-tax rates.

The assumption is that this is a means of soaking big business, and presumably the left wing is the friend of little business.

Actually it works out just the other way. Nearly every excess-profits-tax law enacted under the various Democratic administrations has been of major assistance to the well-entrenched companies and has dealt a severe blow to the smaller competitors.

If the system of free enterprise in America means the removal of unfair competition, then the left wing has followed a consistent pattern over the years designed to help the monopolies and the larger businesses. These big institutions usually have a better base period for computing excess profits than the smaller ones. Also they have large reserves. When the smaller companies are able to make a little money during prosperous periods, the Government takes most of it away from them. As a consequence, when the prosperity ends and deflation begins, these smaller companies usually have not accumulated sufficient reserves to meet the change in economic conditions.

During the last war, Congress definitely took care of postwar deflation. Provisions were inserted in the law allowing refunds to companies that might suffer severe losses in postwar years. No such provisions permitting refunds are in the new law. In the present period of tension there is no postwar period in sight. Hence, in case of a sudden deflation, the companies that started up in the last few years and have begun to obtain a fairly substantial part of the total volume of business done in a particular industry will find themselves in financial difficulties. Extensive unemployment may result from their failures and in many cases they will be swallowed up in forced mergers with large companies.

To maintain highlevel employment it will be necessary to look ahead to the period of deflation that may come in 1953 when the present armament program tapers off. It will be much more expensive then to finance, by means of grants and loans, new work projects of the WPA variety than to protect new businesses now.

This is the time to be thinking of what happens when the present period of tension undergoes a change, as might occur if there is an overthrow of a government in any of the satellite countries and it begins to be apparent that Soviet imperialism is weakening.

It is one of the unexplained factors of present-day legislation that labor-union leaders whose workers have the most to lose from unemployment are the very ones who are pressing Congress to raise the excess-profits rates virtually to the point of confiscation.

The rates in the proposed law about to be enacted are higher than anything encountered in either World War I or World War II. Not only have the regular corporation tax rates been raised to a point far beyond any other rate of its kind heretofore, but the excess-profits rate combined with the regular corporate rates will exceed in severity the rates in effect from 1941 to 1945.

Labor-union leaders may have the idea that, if the rates are high enough employers will diminish their resistance to wage increases and fringe benefits. This may be true of the so-called monopolies, but it is not true of the marginal competitors which are trying during the present boom to get a foothold in their respective industries.

There is, of course, back of this pressure for high rates an effort to squeeze every dollar possible in the mistaken belief that this will avoid for Congress the necessity next year of taxing the lower incomes. But even if 100 percent of the income of individuals earning more than \$10,000 a year were confiscated in taxes, the Federal Government would still be operating at a huge deficit. Taxes are rapidly approaching the saturation point.

What the new tax rates may do to incentive is something to which little thought is usually given by the "left wingers," some of whose ideas of a "planned economy" include Government ownership, nationalization, and forms of state socialism if the economic situation should become chaotic. The responsibility of the "left wingers," however, for bringing on such a period of chaos in a democracy is not always clear when the catastrophe has happened. Hence what is taking place in the Senate these days in connection with the pressure for higher and higher excess-profit taxes is more significant, ideologically speaking, than appears to meet the eye.

Tribute to Emil Rieve by Hon. Hubert H. Humphrey, of Minnesota

EXTENSION OF REMARKS

OF

HON. HUBERT H. HUMPHREY

OF MINNESOTA

IN THE SENATE OF THE UNITED STATES

Friday, September 28, 1951

Mr. HUMPHREY. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD a statement I have prepared regarding a gathering of 1,500 rank and file leaders of New England locals of the Textile Workers Union of America, to do honor to their president, Emil Rieve.

There being no objection, the statement was ordered to be printed in the RECORD, as follows:

STATEMENT BY SENATOR HUMPHREY

On September 29, 1951, about 1,500 people, rank and file leaders of the New England locals of the Textile Workers Union of America, are gathering together in Boston to do honor to their president, Emil Rieve.

I want to use this occasion as a springboard for saying some things about Emil Rieve at a time when the idea of democracy is being challenged with guns and words.

Rieve and democracy have a good deal in common. I know of no union leader—in fact, it would be hard for me to think of a man in public life generally—who has made a greater contribution to the strengthening of our democratic way of life than has Emil Rieve.

As the leader of a large international union, Emil Rieve knows better than most what it takes for unionism to survive and even to grow, in an industry like the textile industry. It has been hard, tough going, and I know from our subcommittee's investigations in the southern textile industry that the union still has a long way to go before the benefits of unionism can be brought to the textile workers of that region.

Under Rieve's leadership, however, the workers in a large segment of the industry know the meaning of democracy from the daily facts of life. They are participating with their employers in arriving at the decisions that affect their conditions of work and their pay and their dignity as human beings.

The scope of Rieve's leadership, however, has gone beyond the very important task of wages, hours, and working conditions. Rieve has been one of the founding fathers of the CIO and has been a pillar of strength in the successful ouster of Communist influence in the CIO.

As vice president of the CIO, he has been chairman of its economic policy committee which has had much to do with formulating CIO's position on the problems affecting our domestic economy.

In World War II, Emil Rieve was a member of the War Labor Board, and in the present defense mobilization period, is a member of the Wage Stabilization Board.

He has represented the CIO on many important international assignments. He is on the executive board of the International Confederation of Free Trade Unions, the world organization of democratic unions.

In every way then, we have in Rieve an outstanding citizen of the labor movement, of the United States, and of the world. It is good that the occasion of this testimonial dinner provides his admirers, among whom I include myself, with the opportunity of honoring his great qualities.

The Physically Handicapped

EXTENSION OF REMARKS OF

HON. JOHN J. SPARKMAN
OF ALABAMA

IN THE SENATE OF THE UNITED STATES

Friday, September 28, 1951

Mr. SPARKMAN. Mr. President, one of the great stories yet to be adequately told is the magnificent contribution being made to the economy of this country by physically handicapped persons. Many of these are doing jobs that seem almost impossible for them to do with their disabilities.

Recently there was a very interesting story in the Birmingham News telling of the accomplishments of two blind veterans; also a story in Modern Industry entitled "The Handicapped." I ask unanimous consent to have printed in the Appendix of the Record these two articles, together with a news item regarding the proclamation of Governor Persons, of Alabama, designating October 7-13 as National Employ the Physically Handicapped Week in Alabama.

There being no objection, the articles were ordered to be printed in the Record, as follows:

[From the Birmingham News]

TWO BLIND ALABAMA VETERANS WIN NATIONAL LEGION HONORS

Two Alabama World War II veterans, one in Birmingham and the other in Gadsden, have won out over what many think are insurmountable handicaps.

The victories in Europe and in Japan had a hollow sound to them, for they still had battles ahead in which no kind of victory appeared in sight. Their battles were with themselves. And they have proved they are "Masters of their fate and captains of their souls."

The Birmingham man is Charles A. (Charlie) Boswell, of 111 Hermosa Drive. Blinded by German shellfire, his story since has been one victory after another. His success has been told in many publications and thousands have seen him speak.

Becoming interested in sports in high school and the University of Alabama, where he was a noted football player, he has retained that interest. Blindness did not stop him.

He started golf after the war and has won one international and five national tournaments. In 1949 the National Disabled Veterans Association named him Hero of the Year.

Boswell's letter tells how his blindness ended hopes for a professional baseball career and left him without means to provide for his wife, small daughter and the baby they were expecting.

He studied Braille, took up golf, found a job selling sporting goods for a local department store, worked his way up to manager of the department. He writes:

"After 7 years of blindness, I feel my rehabilitation is complete. Neither my wife nor I have let my blindness keep us from living a normal life. . . . I have found blindness is not a handicap, it's just an inconvenience."

The Gadsden man is Lewis Moore, of 107 Hillside Circle. A survivor of the Bataan Death March, he lost his sight from a nutritional disease suffered in a Japanese prison camp.

Selfless, he gives credit to the Veterans' Administration and his wife, also a disabled veteran, whom he met in the service. But those who know him realize without his own will to succeed he could not have established a general insurance agency which nets him \$10,000 to \$12,000 a year.

Despite the fact his vision has steadily weakened, he has conducted his insurance business and taken an active part in social and veterans' organizations.

These two handicapped veterans, Boswell and Moore, have won \$1,000 each and a fully paid trip to the national convention of the American Legion at Miami, October 15-18.

They are two of the winners out of 586 entries in Operations Come-back, a contest of letters for handicapped veterans. They are two of four in the Nation who won the top awards for letters written telling how they have overcome their handicaps.

The contest was conducted by the American Legion and the winners announced from Legion headquarters in Washington Saturday. An anonymous donor in New York City provided the money for the contest and awards.

Other two first-place winners are Thomas C. Hasbrook, also a blinded veteran, of Indianapolis, Ind., and Douglas B. Davenport, a paralyzed veteran, of New Lisbon, Wis.

There were 16 other winners in this Nation-wide contest, 4 receiving \$400 each, 4 \$200 each, 4 \$100 each, and 4 \$50 each.

Charles J. Delong, of 126 Brantwood Drive, Montgomery, is one of the \$50-award winners.

The contest closed September 1. Each letter produced a sermon of personal suffering, morale building, and fortitude. There were double and triple amputees, paraplegia, polio, tuberculosis, and the entire gamut of other ills that befall mankind.

The four first-place winners will be presented their checks at the Miami convention. The others will be mailed to the winning contestants.

Final judges for the contest, which opened in June, were Dr. Ross T. McIntyre, a former President's physician; Dr. Verne K. Harvey, medical director of the United States Civil Service Commission, Perry Faulkner, Chief of Veterans Employment Service, Department of Labor; and T. O. Kraabel, Legion rehabilitation director, all of Washington; and Capt. Eddie Rickenbacker, William Randolph Heart, and Dr. Edward Sheckman, all of New York City.

Handicaps were not limited to war injuries. Mr. Hasbrook, a first-place winner, suffered his handicap when a land mine exploded while in training at Camp Lejeune.

Among the winners was a former Wave, who suffered multiple sclerosis and made a comeback. She is Mrs. Ellen Hagen Ahearn, who is now working in the Crime Prevention Bureau in Chicago, Ill.

All judges agreed judging the letters was the toughest assignment they had ever encountered.

Eventually the letters will be produced in booklet form and distributed to other handicapped persons in hospitals.

[From Modern Industry of September 15, 1951]

THE HANDICAPPED—JUDGED BY WHAT THEY CAN DO, NOT WHAT THEY CAN'T, THE PHYSICALLY HANDICAPPED ARE A MAJOR RESERVE OF SKILLED MANPOWER

Physically handicapped workers are one of the four reserves on which industry must depend for more manpower as the effect of billions for defense begins to make itself felt strongly by the end of this year.

A sense of community responsibility, patriotic desire to give work to men injured in World War II, and plain humanity have moved many companies to investigate, and then hire the physically handicapped.

Humanitarianism has seldom paid off so well. Employers have found out over and over again that handicapped workers tend to be tops in productivity, diligence, and attitude. Hundreds of them agree with the slogan, "It pays to hire the handicapped."

By the end of 1952, when the Government estimates that industrial production will be up 20 percent over what it was at the end of 1950—100 percent of that period's civilian production and 20 percent added war production—sheer need for workers will compel many more managements to change their attitudes about hiring the handicapped.

THE FOUR-LAYER POOL

Growth in size of the Armed Forces will almost equal the number of young workers to be added in the next 15 months by the influx from schools and colleges. The rest of the needed workers must come from other sources—women (mainly wives with children, for whom special facilities must be provided), older people now in retirement, minority groups usually the last hired and first laid off—and from among the physically handicapped not now used at all, or used at less than their full skills and abilities.

Training to upgrade workers will help supply the skills that first come into short supply and, in tight labor markets, always remain the hardest to find. But training programs are slow in getting under way in most industries in the current defense effort. Government funds are not available for training to the extent that they were in

World War II, and the manner of letting defense contracts this time makes it harder for employers to absorb training costs.

This reason alone may make many companies turn to the handicapped more quickly, because, for many of the handicapped, free training is already on tap—all they need is jobs.

This point will be stressed in the annual National Employ the Handicapped Week, October 7-13. It's a campaign established by Congress 6 years ago and backed up with a comprehensive year-round program of the United States Employment Service and the Bureau of Employment Security of the Labor Department.

Experience of companies that have hired the handicapped should encourage managements that have never given thought to the problem or have shied away from it because they feared they would need to change jobs or make allowances for handicapped workers.

The fact is that comparatively few adjustments—of tools, jobs, workplaces—are necessary. In most companies, there are so many jobs that can be done without change by people with various handicaps, that the only task is fitting the person to the task.

The United States Employment Service and its affiliated State employment services use methods of fitting people to jobs—selective placement—to perform its work in this area. And big companies that hire the physically handicapped on an equal basis with the unhandicapped find it no problem because they, too, have highly developed selective placement programs.

USUAL PROCEDURES FOR RIGHT PLACEMENT

Western Electric Co., for example, hires many handicapped workers in its Hawthorne Works in Chicago, yet insists it has no special hire-the-handicapped program. Its normal procedures carefully measure every job and every applicant—physically, emotionally, for skill, experience, education, and the like—then fit worker to job. No change is needed in such a procedure to fit a physically handicapped worker to an appropriate job. Physical requirements of any job are one of the measurements of that job, one of the elements in the job description, against which the description of the worker is matched.

It is only the rare company that need go out of its way to change jobs to fit the handicapped. G. Barr & Co., of Chicago, whose president George Barr has only one leg, is an exception. It hires only the handicapped.

Other companies, occasionally, will have a whole plant or a whole shop manned by the handicapped, because some such workers, feeling they have long been discriminated against socially and economically, find it easier to work only with others who have had similar experience.

That kind of operation is commonly considered not best for the handicapped worker himself, however, and obviously presents extra problems for the employer.

Some companies can, and do, take as many physically handicapped as apply for jobs, because they have placement techniques adequate for the task. But they fear to publicize their activities lest they get more than their share of applicants and find it impossible to place them all.

Good news for all employers, small or large, is the fact that through State and Federal employment services he can get placement services that are up to the level of the newest and best that can be obtained. These placement services—accurate job descriptions and analysis and equally skilled worker analysis, including physical demands and physical abilities—are of course only for the placing of the handicapped.

The experience of Leeds & Northrup Co., Inc., in hiring the physically handicapped should answer the questions of many em-

ployers, regardless of size, who are considering recourse to this incompletely tapped source of manpower. Leeds & Northrup started taking on the handicapped in a small way, in its Philadelphia plant, some years ago.

The experiment turned out so well, for both worker and company, that the management now has made it a conscious and deliberate policy. Thereby it has won a regional award of the National Employ the Handicapped Committee for its outstanding record.

Of its entire labor force, about 5 percent are physically handicapped as defined by the Pennsylvania State Employment Service. They range from workers with heart murmurs to polio victims, include many who are blind, deaf, mute, or lack an arm or leg.

MOST NEED NO EXTRA ATTENTION

An occasional job has been reengineered to make it suitable for a blind worker, for instance. But the bulk of Leeds & Northrup's handicapped employees do exactly the same work as those without handicaps, in practically the same way and with the same tools and machines.

The company has found its workmen's compensation rates have not gone up, because the handicapped are many times more careful than the average worker. The very fact that people discouraged by previous poor prospects have been given a chance to hold normal jobs has put most of them up among the most stable workers on the payroll. Their absenteeism is low and their productivity, as measured by incentive earnings, ranges from average to far above average.

Chief ingredients in Leeds & Northrup's success with the handicapped have been:

- 1 Foreman understanding and agreement with the aim, and foreman patience in acousting workers to their jobs and helping them become adjusted to normal job routine.
- 2 The appreciation of the handicapped employee for the opportunity to make a living with self-respect rather than from charity or philanthropy.

With increasing use of the handicapped, no employable worker, no matter what his disability, need have the latter feeling.

STATE TO HONOR HANDICAPPED—ALABAMIANS ARE URGED TO LEND ASSISTANCE

Praising the physically handicapped of Alabama as capable workers, Gov. Gordon Persons has issued a proclamation designating October 7-13 as National Employ the Physically Handicapped Week in the State.

The proclamation urged Alabamians "to cooperate and to lend their assistance and encouragement in the observance of the week in order to enlist public interest in and support of programs for the employment of the physically handicapped."

ONE THOUSAND SEVEN HUNDRED AND TWELVE HANDICAPPED

As of August 31 the Alabama State Employment Service, a division of the State Department of Industrial Relations, had a total of 41,097 job seekers on file, of which 1,712 were listed as physically handicapped.

Governor Persons' proclamation asserted the "physically handicapped of this State have demonstrated that they are capable workers when placed in jobs suited to their training, abilities, and experience and therefore as a group constitute a valuable segment of manpower."

NATION NEEDS SERVICES

"The Nation as a whole needs the services of every person capable of productive work in the task of mobilizing to meet the requirements of defense and to maintain the civilian economy," the Governor's proclamation said.

Questions of the Week

EXTENSION OF REMARKS

OF

HON. GEORGE H. BENDER

OF OHIO

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 13, 1951

Mr. BENDER. Mr. Speaker, when does Mr. Truman start a purge of his executive department heads? Internal Revenue? Office of Price Stabilization?

Does anyone count the number of Government publications going out of Washington every day? Better not ask the question. Mr. Truman might name somebody to a full-time job doing it.

Address by President Truman to the Washington Pilgrimage of American Churchmen

EXTENSION OF REMARKS

OF

HON. A. S. J. CARNAHAN

OF MISSOURI

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. CARNAHAN. Mr. Speaker, under permission to extend my remarks in the Record, I include herewith an address to the Washington Pilgrimage of American Churchmen at the National City Christian Church in Washington, D. C., on Friday, September 28, 1951, by the President of the United States:

THE TEXT OF TRUMAN'S TALK TO PILGRIMS

I am happy to have the privilege of speaking to this meeting of the Washington Pilgrimage of American Churchmen. You have come to the Nation's Capital to visit its monuments and to look at the basic documents on which our Government was founded. Many people come to Washington to do these things, but you have come here for a special purpose. You have come here to emphasize the fact that this Nation was founded on religious principles.

You will see, as you make your rounds, that this Nation was established by men who believed in God. You will see that our founding fathers believed that God created this Nation. They believed that God was our strength in time of peril and the source of all our blessings.

If we go back to the Declaration of Independence, we notice that it was drawn up by men who believed that God the Creator had made all men equal and had given them certain rights which no man could take away. In beginning their great enterprise, the signers of the Declaration of Independence entrusted themselves to the protection of divine providence.

To our forefathers it seemed something of a miracle that this Nation was able to go through the agonies of the American Revolution and emerge triumphant. They saw, in our successful struggle for independence, the working of God's hand. In his first inaugural address, George Washington said, "No people can be bound to acknowledge and adore the invisible hand, which conducts the affairs of men, more than the people of the United States."

RELIGIOUS FREEDOM STRESSED

Another fact which you will notice in the course of your pilgrimage is that the makers of our Constitution believed in religious toleration. There was the highest type of religion, forbidding the use of coercion or force in matters of the mind and spirit. Religious freedom was a part of their religious faith.

It is said that when Benjamin Franklin left the Constitutional Convention he was asked, "What have you given us?" He answered, "A republic, if you can keep it." Millions of Americans since then have believed that the keeping of our Republic depends upon keeping the deep religious convictions on which it was founded.

From the worship and teachings of the synagogues and churches of our land have come a moral integrity, a concern for justice and human welfare, a sense of human equality, a love of human freedom, and a practice of brotherhood which are necessary to the life of our national institutions.

It is fitting and proper that at this time of international peril and uncertainty we should look back to these beginnings and rededicate ourselves to these ideals.

It is not enough, however, simply to look back. It is not enough to congratulate ourselves upon the religious spirit of our forebears. We must ask ourselves if we truly believe the things which they believed. We must examine our conduct to see whether we are carrying out in our daily lives the ideals we profess.

This is not easy. Our religious heritage imposes great obligations upon us. It does not permit us to be self-satisfied and complacent. Indeed, if we accept the faith which has been handed down to us, our task as a nation is much more difficult. We cannot be satisfied with things as they are. We must always be striving to live up to our beliefs and make things better in accordance with the divine Commandments.

LESS EXCUSE FOR WRONG

The people of Israel, you will remember, did not, because of their covenant with God, have an easier time than other nations. Their standards were higher than those of other nations and the judgment upon them and their shortcomings was more terrible. A religious heritage, such as ours, is not a comfortable thing to live with. It does not mean that we are more virtuous than other people. Instead, it means we have less excuse for doing the wrong thing.

Our religious heritage, in my opinion, imposes great responsibilities upon us as we face the problems of today.

It means first of all that we must constantly strive for social justice in the life of this Republic. It means that we must fight against special privilege, against injustice to those of low income, against the denial of opportunity, against discrimination based on race, creed, or national origin.

Our religious heritage also means that we must struggle to maintain our civil liberties. No nation which hopes to live by the law of God can afford to suppress dissent and criticism. You may remember that Israel persecuted the prophets. The prophets had unpleasant things to say about what was going on in ancient Israel. They criticized social injustice and the wasteful luxury of the privileged few.

They criticized the way in which the ancient Hebrews had turned away from true religious principles. They said that Israel would be punished for its misdeeds. The prophets were not popular, and the kings and the priests of Israel tried to deny them freedom of speech. But the prophets were right, and Israel was punished as they had said it would be.

We must always keep the way open for self-criticism. We must not stop up the

mouths of those who are saying unpopular things. We must preserve the Bill of Rights so that the voice of protest and dissent may always be heard. We must not try to destroy people by fear and slander, because if we do we shall weaken the moral fiber of our country.

DEEDS CALLED REAL TEST

Another great lesson which our religious heritage has for us today is that we must not be led astray by self-righteousness. We must remember that the test of our religious principles lies not just in what we say, not only in our prayers, not even in living blameless personal lives—but in what we do for others.

It is all too easy for church-going people to be satisfied with a superficial standard of morals. It is all too easy to sit in judgment on the shortcomings of others. It is all too easy to feel morally superior because we go to church and profess to follow the faith of our fathers.

We must remember that in His ministry on earth, Jesus delivered His strongest condemnations against those who were superficially good. The scribes and the Pharisees he attacked were the respectable people of His day. They were the leaders of the community who set the standards for others. To them He said, "Thou hypocrite, first cast out the beam out of thine own eye, and then shalt thou see clearly to cast out the mote out of thy brother's eye."

Self-interest can blind us today, just as it blinded the scribes and Pharisees of Biblical times. We must always be on our guard against this danger.

If we are to respond to our religious heritage, we must be guided by the principle of charity—charity in the Biblical sense of love for one's fellow man. This is the greatest virtue, without which other virtues are of little worth.

We must work for morality in public life and in private life. We must stamp out crime and eliminate corruption. We must have high standards of personal conduct.

But even if we do all these things, that still is not enough. The final question that will be asked of us, as individuals and as a society, is "what have we done for our fellow man?" What have we done to ease his burdens, to give him greater opportunity, to help him in time of trouble, and to make the world a better place for him to live in? For unless we can answer those questions, we will not have carried out in our lives the religious heritage which has come to us from our forefathers.

Today, our problem is not just to preserve our religious heritage in our own lives and our own country. Our problem is a greater one. It is to preserve a world civilization in which man's belief in God can survive. Only in such a world can our own Nation follow its basic traditions, and realize the promise of a better life for all our citizens.

DOUBLE PERIL IS NOTED

Today, the whole human enterprise is in danger. On the one hand, we have to resist the expansion of a power that is hostile to all we believe in. It is a power that denies the rule of law, the value of the individual, and belief in God. It is a power which has become militant and aggressive, using the weapons of deceit and subversion as well as military might.

On the other hand, we must do all we can to prevent the outbreak of another world war. Such a war, using modern instruments of destruction, would be more terrible than anything we have ever experienced. It would make a battleground of the crowded and complex cities of the modern world. It might well shatter our whole economic and social system, and plunge mankind back into barbarism.

This is the great problem we must meet. We cannot yield to Soviet communism without betraying the ideals we live for. We cannot have a new world war without jeopardizing our civilization.

In this perilous strait our greatest source of strength, our greatest hope of victory, lies in the God we acknowledge as the ruler of all. We turn to faith in Him to give us the strength and the wisdom to carry out His will. We ask Him to lead us out of the dangers of this present time into the paths of peace.

In this crisis of human affairs, all men who profess a belief in God should unite in asking His help and His guidance. We should lay aside our differences and come together now—for never have our differences seemed so petty and insignificant as they do in the face of the peril we confront today.

It is not just this church or that church which is in danger. It is not just this creed or that creed which is threatened. All churches, all creeds, are menaced. The very future of the word of God—the teaching that has come down to us from the days of the prophets and the life of Jesus—is at stake.

For some time, I have been trying to bring a number of the great religious leaders of the world together in a common affirmation of faith and a common supplication to the one God that all profess. I have asked them to join in one common act which will affirm those religious and moral principles on which all agree.

A BOND OF BROTHERHOOD

Such an affirmation would testify to the strength of our common faith and our confidence in its ultimate victory over the forces that oppose it.

I am sorry to say that it has not yet been possible to bring the religious faiths together for this purpose of bearing witness that God is the way of truth and peace. Even the Christian churches have not yet found themselves able to say, with one voice, that Christ is their Master and Redeemer and the source of their strength against the hosts of irreligion and the danger of a world catastrophe.

Despite the barriers that divide the different churches, there is a common bond of brotherhood that underlies them all. We must continue our effort to find those common ties, and to bring the churches together in greater unity in a crusade for peace. In this way, we shall come closer to the one God who is the father of us all. In this way, we shall find greater power to meet the troubles of our time.

The way to such unity is long and hard. But we must continue to strive for it. And we must ask God's help. If we really have faith, perhaps God will give us what we are not able to attain by our own efforts.

God grant that we may speak together, as brothers, of His power and His mercy, and bear witness of Him against those who deny Him.

May God unite the churches, and bring us peace.

Federal-State Supervisory Relations

EXTENSION OF REMARKS
OF

HON. IRVING M. IVES

OF NEW YORK

IN THE SENATE OF THE UNITED STATES

Monday, October 1, 1951

Mr. IVES. Mr. President, I ask unanimous consent to have printed in the Appendix of the Record an address delivered by Mr. Elliott V. Bell, editor and

publisher of Business Week, at the golden jubilee meeting of the National Association of Supervisors of State Banks, at the Hotel Jefferson, St. Louis, Mo., on Thursday, September 27, 1951.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

FEDERAL-STATE SUPERVISORY RELATIONS
(By Elliott V. Bell)

I have agreed to wind up this symposium with a few words on the relations between State and Federal supervisory authorities. But before I get into that, I'd like to make one or two comments about bank supervision in general as it appears to an ex-supervisor who is now on the boards of two banks.

The principal point I want to make is this. The people you supervise don't always understand you. All too frequently they don't know what your proper function is, what your powers and responsibilities are or what their obligations under the law are.

This is especially true of bank directors and trustees, most of whom are not experts in either banking or banking law.

I would like to make the suggestion that wherever practical each State banking department prepare a little pamphlet summarizing some of the main points of the law, outlining the chief duties and responsibilities of directors and describing the organization and function of the banking department. There should be one of these pamphlets prepared for each type of institution supervised and each time a new board member is elected he should be mailed a copy of the appropriate pamphlet.

A fertile source of misunderstanding, of course, is the bank examination. The average director thinks an examination is just a kind of audit to see whether all the cash and securities are really there. The average bank management hates to have anything called to the attention of the board of directors that would cause them to start asking troublesome questions. So when the examination report raises any disturbing points, management is apt to explain that the examiner in question is frustrated or got out of bed on the wrong side—anything to suggest that the criticism is merely a personal idiosyncrasy of the examiner. Most directors, not understanding that an important purpose of an examination is to disclose whether a bank is being reasonably well run, will quickly accept management's brush-off of the examiner's comments—a few harsh words are said about bureaucrats in general—and the whole thing is forgotten for another year.

In some States directors receive from the banking department a notice when an examination report is sent to the bank with which they are associated. I would suggest that such notices be made a general practice and that they be expanded to describe briefly the scope and underlying purpose of examinations. I would also suggest that directors be required to sign a statement that they have seen the examination report and read the examiner's comments.

On the side of the supervisory authorities, much improvement is needed in examination work. In the larger States, the examiner is apt to be the only contact a bank has with the Department from 1 year's end to another.

Occasionally examiners, particularly those who have been on the job too long, get to thinking they really are the whole department and maybe God's special representative too. They begin to demand as a right all sorts of special attentions and deference; they hand out special rulings with the greatest of ease, and make banking law as they go along. Often the banker, particularly in a small community, thinks it better to put

up with this kind of petty tyranny than to complain and risk having to deal with a resentful examiner henceforth.

Examiners should be more closely supervised and from time to time should be required to take refresher courses and examinations on the banking law and on the duties and responsibilities of bank examiners.

Finally it must be constantly borne in mind that for most people a bank supervisor is an awesome and mysterious character. Those whom we supervise all too often come in contact with us only when they are in some kind of trouble.

The bank supervisor should constantly emphasize that he is always available to the citizen who has legitimate business to do with the department. Everyone who comes to the department, even if he has been called in for disciplinary action, should be treated with the utmost courtesy and sent away with the conviction that the people in the banking department are hard-working, conscientious public servants.

Now for the matter of Federal-State supervisory relationships. The greatest single weakness in bank supervision in this country today, in my judgment, is the continued failure to work out closer and better relations between the State and Federal supervisory authorities.

The events of the great depression should have taught a bitter lesson to the banking world. The shocking record of bank failures was a direct consequence of overchartering of banks in the boom period of the twenties and competition in laxity among supervisory authorities of that time.

I believe the Office of the Comptroller of the Currency remembers that lesson. I believe the Federal Reserve banks have not forgotten it. Whatever differences of opinion may arise from time to time over the methods and tactics it occasionally uses, I believe we all agree the FDIC has exerted an important influence on the side of good banking. I believe our State bank supervisors are also mindful of the teachings of the great boom and crash of the twenties and early thirties.

There is, however, one supervisory agency that either learned nothing from this past experience or chooses recklessly to ignore the teachings of banking history.

That agency is, of course, the Federal Home Loan Bank Board. The Federal Home Loan Bank Board came into existence in 1932 but did not begin to play an important role until some time after banking holiday of 1933. Its whole experience has been in a period of recovery and actual inflation.

Anybody can look good while prices are rising, for the rising tide of inflation covers up any mistakes. But good times never last forever. It is a sound principle of bank supervision that we should be strict in good times in order that we may be more lenient in hard times.

Yet we find the Federal Home Loan system encouraging savings and loan associations to shift from State charters to Federal charters in order in order to avoid the restraints of State supervision—in other words, competition in laxity.

We find the Federal Home Loan Bank Board waging what can only be called a war of aggression against State policy with respect to branches. In cynical disregard of State laws, State supervisors, State institutions and the traditions of the dual banking system, the Home Loan Bank Board has repeatedly authorized branches where State law and policy would not have permitted them and has granted branch powers across State lines. I believe these policies of the Federal Home Loan Bank Board to be unwise and unsound. I believe it is correct to say that they are condemned by all other supervisory agencies both State and Federal.

It is to be hoped that the National Association of State Bank Supervisors and the

National Association of State Savings, Building and Loan Supervisors will continue their efforts to arouse Congress to the need for legislation to define the branch privileges of Federal savings and loan associations and to moderate the present ill-advised course of the Federal Home Loan Bank Board.

Meanwhile it is important, I think, that we do not allow our irritation at the provocative actions of this one Federal agency to affect our efforts to strengthen the cooperation with other and more experienced Federal agencies.

Federal-State cooperation in the field of bank supervision, it seems to me, calls for the following:

1. The States should recognize a paramount national interest in matters relating to the price, the quantity, and the availability of money. That means State supervisors should be willing to take their lead from the Federal Reserve in matters of interest rates and reserve requirements.

The Federal authorities, for their part, should recognize that a State has a right to decide whether independent, chain, group, or branch banking is best suited to the needs of its people and if branch banking is permitted the extent and area to which branch operations should extend. No national interest requires the Federal Government to seek to invade the rights of the States in this matter.

2. State and Federal supervisory agencies should compete with each other in the raising of standards not in lowering them. They should never seek to induce banking institutions to change from State to Federal charter or vice versa in the expectation of obtaining laxer supervision.

3. Every effort should be made to provide for uniformity of practices and of standards, particularly in the matter of examinations, and to minimize inconvenience to banks under two jurisdictions. I am hopeful that the Federal Reserve System will soon make a start in accepting State examinations of member banks as they now accept national examinations.

4. No supervisory agency—State or Federal—should make a major change of policy affecting others without first consulting with the supervisors concerned.

5. Means of regular and frequent consultation between the Federal supervisory agencies and officials of the National Association of Supervisors of State Banks should be developed. Such regular discussions would, I believe, make for a better continuing relationship and be in the public interest.

Our dual system of State and Federal bank chartering is in harmony with our dual system of government. Admittedly it does not have the theoretical efficiency of a single unified system any more than our Republican form of government has the stream lined directness of a dictatorship. But like our other free institutions, the dual banking system of America has served our people well—far better than they could ever be served by a glorified Nation-wide RFC complete with mink coats, refrigerators, snake farms, perfume, and just a small, a very small ham.

There will always be men, some crafty, some just stupid seeking to destroy the dual banking system. Some, like the present most active enemies of the system, do it because they have more ego than understanding, some attack it out of simple bureaucratic lust for power; some because they are full of bookish theories but lacking in real experience; some because they are basically hostile to our free institutions and want to centralize all power in Washington as a step toward their own pet brand of totalitarianism.

But there is nothing new in all this. Freedom must be fought for every day and the institutions of a free society can never be taken for granted. It is a part of the larger

responsibility of the State bank supervisors that by their conduct and example, they should champion every day the dual banking system which has served our Nation so well.

Teaching

EXTENSION OF REMARKS OF

HON. LESTER C. HUNT

OF WYOMING

IN THE SENATE OF THE UNITED STATES
Monday, October 1, 1951

Mr HUNT. Mr. President, there has been called to my attention a brief but excellent editorial in the magazine the New Age of September 1951, under the caption "Teaching," written by Mr John H. Cowles, sovereign grand commander of the Supreme Council, Thirty-third Degree Scottish Rite Free Masonry of the southern jurisdiction. I ask unanimous consent that it be printed in the Record.

There being no objection, the editorial was ordered to be printed in the Record, as follows:

TEACHING

Teaching bears a close analogy to salesmanship. The salesman deals with many varieties of human nature, mostly adults, the teacher deals with a wide variety of human nature, mostly young persons in the formative years. It is taken for granted that both the teacher and the salesman know their respective "lines" or "wares." The next step is to induce the customer to want what the salesman has to sell or the teacher has to impart but in the case of the teacher the "customer" is called a pupil or student.

Like salesmanship, teaching is also both an art and a science. The art of teaching, like the art of selling, presupposes a considerable degree of tact and common sense. But at this point comes a break in the analogy between selling and teaching, because the salesman is free to use his judgment if he is an out-of-doors salesman working on a commission basis and not an indoor one restricted by rules, the teacher, having no voice in the making of rules, is sometimes restricted in the exercise of tact and common sense, because so often school boards and school administrations, jealous of their power, have made a fetish of rules. But if they themselves had to observe them, they would find that several were needlessly restrictive in their work. Rules are supposed to be to human relations what oil is to machinery—to aid in smooth operation—but there is a wide variety of lubricants for a wide variety of purposes and machines. So in human relationships there must be flexibility if rules are to aid the teacher rather than hinder.

The salesman has reports to make out for the home office, but, unlike the teacher, he does not have 30 to 40 papers to correct and detailed bookkeeping regarding each child's health and standing—a mass of detail heaped on top of preparation of the next day's work. Bookkeepers should do this work and thus leave the teachers free for the important work of teaching and preparation. Also, and very important, is the size of the classes. These have been running from 30 to 40 pupils per classroom. Educators are agreed that no teacher can give proper personal attention to that many children and that classes not in excess of 20 pupils is a goal that must be aimed at and reached if our schools are to do their best work.

Teaching is not a commercial enterprise for financial gain. True, teachers must have re-

muneration, and a liberal one at that. But those who enter the teaching profession do so as a calling, a high and exalted calling, with serious responsibilities in molding the lives of the next generation. It is the work of one who has the crusader's spirit, and the great teachers have invariably had such a crusader's outlook. Their pay-off has come 20 or 30 years later when their former pupils and students have reached successful places in business and the profession and have looked back to call such teachers "blessed."

JOHN H. COWLES,
Thirty-third Degree,
Sovereign Grand Commander.

Initiative in the Air as a Means to Victory and to Lasting Peace

EXTENSION OF REMARKS OF

HON. JOHN W. McCORMACK

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. McCORMACK. Mr. Speaker, I have long been an admirer of Gen. Nathan F. Twining, the Vice Chief of Staff of the United States Air Force. An able officer with a distinguished record, General Twining is also an air statesman. As commanding general of the Thirtieth Air Force in the Pacific and of the Fifteenth Air Force in Italy, as Commander of the Mediterranean Allied Strategic Air Forces and of the global Twentieth Air Force—after July 1945—General Twining proved himself a great air strategist, and gained the broad experience that is fundamental to the penetrating analyses of the world situation which he contributes to military planning today. A man of superb administrative ability, General Twining has strengthened both the Air Materiel Command and the Alaskan Command during tours of duty preceding his assignment to Headquarters, USAF. Experienced in teamwork and joint operations, it is greatly to General Twining's credit, and a distinction that becomes him, that he commanded the Allied Air Forces of various nations in the Mediterranean theater during the war, and as first commander in chief of the Alaskan Command, after October 1947, he commanded United States Army, Navy, and Air Force units in one of the most important regions of the world today. From that latter position, he had a close look at Russia, and at the nature of the defense we must build against that unfriendly neighbor.

Out of his wide experience General Twining has recently culled some words of warning important to every serious-thinking American:

Today world events are moving toward a climax that may bring new hopes for peace—or a world-wide war.

General Twining reminded us in an address at the annual dinner of the Boston Stock Exchange last Monday, and he repeated the age-old warning that is too often ignored:

Among nations as among men, the best protection against a criminal is the power

and the determination to strike back swiftly and decisively. Today—

General Twining finds—

the people of the United States have the determination and they are building the power.

This power can be built because our industrial production is great and Congress has risen to the challenge. General Twining is fully appreciative of the work of the House and the Senate in investigating our entire defense problem. But the power can be built also because, thanks to American genius and engineering skill, we have the force and the weapon with which to reach the very heart of our enemy's power—the United States Air Force, and the atomic bomb. From earliest time, victory has been won most quickly and most surely by the destruction of the most critical targets—by isolating and disarming military forces as well as by destroying them. Today, the industrial support which any modern armed force must have in order to continue fighting can be destroyed most readily through the judicious application of air power.

Like every responsible Air Force leader, General Twining emphasizes that a strong Air Force is essential not merely to win victory in a war that might come, but to maintain peace—if peace can indeed be maintained.

If we build now the force we need to provide protection for ourselves and aid for our allies it is still possible that we may never have to use such a force in war.

Until lasting peace is brought to the world, however, we must continue to build up our Air Force. General Twining, in his Boston speech, made some shrewd and high level observations on the importance of atomic weapons in this growing Air Force.

Mr. Speaker, we have heard within the last few days the warning of Secretary of Defense Robert A. Lovett that atomic weapons promise no new, inexpensive, or magic way to win wars. General Twining made no assertion that there is. But to atomic bombs, carried by medium or light bombers, we can now add atomic weapons for use against enemy ground troops as well as against more concentrated targets. The result is increased versatility in our atomic attack, a versatility that introduces the most revolutionary period in the entire history of warfare.

Against this larger concept of modern warfare and strategy, General Twining put the action in Korea in proper perspective. There has been no all-out struggle for air supremacy in Korea.

We are not attacking enemy air bases and they are not attacking ours. Battles between jet fighters are less destructive, so far, than the encounters of World War II.

This situation may not remain true indefinitely—or, if it does, it may be so to our own peril.

Whenever an air force is forced to abandon an aggressive strategy, its days are numbered. Like the wars on horseback of the previous century, the air wars of this century must be fought and won at full tilt.

They must also be fought and won by an air force equal to the challenge. It takes 3 or 4 years to build a modern air

force. The Air Force we have today is the one we bought 3 and 4 years ago. The Air Force we need today is the one we failed to buy at that time. We must build today the Air Force that will win tomorrow's victories. Only by doing so will we maintain initiative and be able to gain and hold supremacy in the air.

Mr. Speaker, with these words of solemn warning, General Twining ended his brief but telling remarks, still reasserting, to be sure, that "our goal is always to return to the peace and prosperity for which this country was founded."

Mr. Speaker, under unanimous consent, I include General Twining's succinct analysis of the task before us in the CONGRESSIONAL RECORD. The remarks are as follows:

ADDRESS BY GEN. N. THAN F. TWINING, VICE CHIEF OF STAFF, UNITED STATES AIR FORCE, AT THE ANNUAL DINNER OF THE BOSTON STOCK EXCHANGE, SEPTEMBER 24, 1951

Today world events are moving toward a climax that may bring new hopes for peace—or a world-wide war. With the possible exception of a few men in the Kremlin, no man knows which it is to be. In this country we all want peace and we will continue to hope for peace as long as hope can be justified. But the rulers of the Soviet Union preach peace, while they instigate war.

These rulers came to power through assassination and terror. They remain in power by the calculated enslavement and liquidation of millions of their fellow Russians. There is no reason to believe that they will show any greater sympathy or concern for the people of other nations than for their own.

We can expect that they will continue to use force against us and our allies whenever and wherever they can increase their power. But it is reasonable to believe that they will not strike the United States directly until they have completed their preparations for a powerful and devastating blow. And it is unlikely that these rulers of Russia will move directly against us unless and until they are convinced we can no longer strike them a staggering blow in return.

Among nations as among men, the best protection against a criminal is the power and the determination to strike back swiftly and decisively. Today the people of the United States have the determination and they are building the power.

The building of military power on this huge scale will absorb a high percentage of our industrial production. The cost of our military program is so great that it must be constantly examined to insure that all expenditures are wise and prudent. This is the task not only of the services, but of the Department of Defense, the Bureau of the Budget, and of the Congress.

We have been impressed by the thoroughness with which the committees of Congress charged with this task have gone about their work. The House of Representatives specializes in fiscal matters and Representative MAHON's committee has performed the duty well. I have been especially impressed by the work of the Senate Committee on Military Appropriations which has just been concluded. The hearings of this committee were conducted in a masterful manner by Senator O'MAHONEY and they were completed in 3 months. The open record is a volume containing almost 2,000 pages—despite the fact that much of the testimony was not printed because of its secret nature. Senator O'MAHONEY would never accept half an answer when he wanted a full answer to any question.

Your own able Senator SALTONSTALL was a member of this important committee. His able colleague, Senator LONCE, assisted the

committee and the Senate by testifying and by personally investigating our entire defense problem. As long as we have men in key legislative positions who are as competent as these our defense program will be thoroughly examined and wisely handled. We will have enough of the right kind of power to prevent aggressors from achieving their murderous aims.

To protect themselves against retaliation, the rulers of Russia have taken full advantage of their strong geographical position. They have developed the principal sources of their military power deep within the great continent of Eurasia. No other nation is so well insulated against attack by land or sea.

Except for American pioneering in the development of long-range air power the prophecies of the geopoliticians might have come true. The rulers of an industrialized and militarized Russia might easily have dominated the Eastern Hemisphere and eventually the entire earth. But their great land area and their hundreds of divisions cannot save their industry and armament from destruction by a superior air force. There is reason to hope that until they are convinced they can prevent us from building and maintaining a superior air force they will not begin the greatest of all wars.

The ability of an air force to penetrate to the most vital targets is of first importance. To concentrate the destructive power of an air force against targets that happen to be close at hand would be wasteful and indecisive. Warfare can no longer be confined to the small battlefields of yesterday. Modern air war and the demands of total war have widened the field of battle from a few miles to thousands of miles—from artillery range to bomber range.

As always in war, the quickest and cleanest victory will be won by the strategist who proceeds directly to the most critical targets. Since the earliest days of organized warfare, decisions have been won by isolating and disarming military forces as well as by destroying them. Decisions have been won by cutting off reinforcements, by denying supplies—and finally, by destroying the industrial support which any modern armed force must have in order to continue fighting. These things can now be accomplished much more readily through the judicious application of air power.

For no modern war can be fought without massive industrial support and supply. The installations necessary for manufacture and supply on such a scale must also be massive. They are highly vulnerable to attack from the air. When the most critical targets are selected—and this is an art we are just beginning to learn—their rapid destruction can have only one result: to reduce enemy military forces to impotence.

The power of the atomic bomb has greatly increased the advantages of deep penetration to those targets that are most vulnerable and at the same time most vital. We will continue to improve the range, the speed, and the altitude of planes that can deliver our best weapons to the most desirable targets. And we must produce these planes in sufficient numbers to saturate and overwhelm enemy defenses that are constantly being improved.

Our ability to do this is indispensable to our hopes for peace and to our plans for victory if peace becomes impossible. We have many vital industrial plants in this country that cannot be moved or hidden or dispersed. So has an enemy. We have no choice but to insure that we can reach these vulnerable and vital installations and hit them harder and more often than he can hit us. Such an ability is a strong influence for peace and guarantee against defeat.

But we have other responsibilities and other opportunities. We have the responsibility to furnish all possible protection for our allies. Most of these allies are far more

vulnerable to air attack than we are. Some of them are also vulnerable to ground attack, which we are not. We now have a growing confidence that our atomic weapons will help to save our allies from destruction by enemy air forces and from capture by enemy ground forces.

The effectiveness of these weapons has been improved by new methods of construction. It will also be possible to carry some atomic weapons on smaller planes. Our ability to do this will provide us with greater versatility in our atomic attack.

I must point out, however, that the Air Force's ability to use atomic weapons in support of friendly ground troops is by no means limited to delivery by these smaller planes. The medium bomber, especially the jet bomber, is the most reliable vehicle for delivering the most effective bombs against targets within medium bomber range.

The principal reason for increased interest in new targets for atomic weapons is a simple one. We must capitalize on our increasing atomic superiority. The Atomic Energy Commission is on the threshold of greatly increased production. We can now plan toward a wider use of atomic weapons against enemy ground troops as well as against more concentrated targets.

The combination of air power and atomic power has introduced the most revolutionary period in the entire history of warfare. The proper application of the new weapons and new means of delivery is receiving serious and intensive study. An air campaign can now be as destructive as the most bitterly fought surface invasion and in a much shorter period of time.

Do not be deceived by the apparent indecisiveness of the daily air encounters over Korea. Serious and critical as they are, they do not yet represent an all-out struggle for air supremacy. We are not attacking enemy air bases and they are not attacking ours. Battles between jet fighters are less destructive, so far, than the encounters of World War II. There are several reasons for this. While air combat is revolutionizing warfare, the jet engine is changing the old tactics of air combat. Jet planes can absorb much more damage than the old-fashioned fighters and manage to get home. This is true because their vulnerable area is smaller and because their fuel is less inflammable. In addition, these battles in Korea are being fought at speeds very near the speed of sound. The smooth handling of aircraft and the delivery of accurate fire at such a speed is still a problem. But it is a problem that is gradually being solved. We hope that some of our improvements will soon be demonstrated. Unfortunately, the enemy is learning also, and we can expect that the steadiness in his fighters at some speeds will also improve. Lately he has been ranging further and further below the Yalu and committing more and more MIG's to combat. The air battles in Korea are becoming more and more critical and more and more important.

It is true that the struggle for air supremacy is not decided entirely by fighter planes in air combat. In the air campaigns of the past we have destroyed more enemy planes on the ground than in the air. But success in air combat is highly important. In Korea it is practically our only means of keeping the enemy off the tails of our planes, attacking enemy troops and off the backs of our own troops on the ground. The challenge to air combat is a challenge that must always be met, even though the odds are against us. Whenever an air force is forced to abandon an aggressive strategy, its days are numbered. Like the wars on horseback of the previous century, the air wars of this century must be fought and won at full tilt.

As we have pointed out many times in the past, the Air Force we have today is the only

we bought 3 or 4 years ago. The Air Force we need today is the one we failed to buy at that time. In this country we have the means and the ability again to produce and maintain the farthest-ranging, hardest-hitting Air Force in the world.

In the first two wars of our country's history the aggressive tactics of our seamen helped to save the day. Their bold forays into the far Atlantic made it possible for us to endure costly defensive wars on the ground. We have also been able today to project American spirit and skill into the stratosphere that reaches beyond both the Atlantic and the Pacific.

Our ability to maintain control of the air above us and above our allies must be included in any effective bid for peace or, if necessary, for victory. To maintain this control effectively we must always be able to invade an enemy's air space more decisively than he can invade ours. And we must be able to accept challenges to air combat, no matter what the odds, just as we are doing in Korea today.

In order to furnish dependable aid and support to our troops on the ground we have to keep the initiative in the air. This is being accomplished today only by the skill and spirit of the pilots and crews of the Far East Air Force.

If we build now the force we need to provide protection for ourselves and aid for our allies it is still possible that we may never have to use such a force in war. This is the most important of all facts today. Even as we fight to bring peace to the Far East we must build to bring a lasting peace to the world. Our goal is always to return to the peace and prosperity for which this country was founded.

Removal of Crosses in Honolulu Cemetery

EXTENSION OF REMARKS OF

HON. WILLIAM LANGER

OF NORTH DAKOTA

IN THE SENATE OF THE UNITED STATES
Monday, October 1, 1951

Mr. LANGER. Mr. President, I ask unanimous consent to have printed in the Appendix of the Record two telegrams protesting the removal of the crosses marking the graves of veterans buried in the National Memorial Cemetery at Honolulu. The first is from Brig. Gen. Henry Darlington, chaplain, Reserve headquarters of the New York National Guard. The second is from Rev. Lawrence Reilly, executive secretary of the Christian Antidefamation League, Inc., of Detroit, Mich.

There being no objection, the telegrams were ordered to be printed in the Record, as follows:

DETROIT, MICH., September 29, 1951.

Senator WILLIAM LANGER,
Senate Office Building,
Washington, D. C.:

We consider it important all Christians voice outrage at removal of the cross of Christ from graves of our Christian dead. It is our sincere belief that our soldier dead are entitled to have the symbol which they loved and for which they died to mark their resting place. Thank God we live in a country that can still combat the atheistic principles of Soviet Russia, whose fellow travelers have inspired this dastardly action. Isn't it paradoxical that while building a temple for the four chaplains that we permit Anna M. Rosenberg to remove the symbol of Christ?

If we permit this, we are taking away from the sorrowing mothers the thought that their sons no longer lie buried under the symbol of the cross. It is tragic to needlessly waste the lives of the flower of our youth in Korea, without going further and desecrating the cross. We urge your help in stopping this anti-Christian, bigoted, and intolerant action.

Rev. LAWRENCE REILLY,
Executive Secretary, The Christian
Anti-Defamation League, P. O. Box
1116, Detroit 31, Michigan.

NEW YORK, September 29, 1951.
Hon. WILLIAM LANGER.

Consider it imperative that all Christian people voice their outrage at the removal of the cross of Christ from the graves of our Christian dead buried on the hill of sacrifice, Hanau's National Memorial Cemetery, overlooking Honolulu. This action savors of an atheistic Soviet Russian attack against our Christian belief. Please protest to Congress, to all Christians, and in every way possible to have this sort of thing stopped before similar action is taken in all cemeteries.

HENRY DARLINGTON,
Chaplain, Brigadier General Reserve
Headquarters, New York National
Guard.

Proposal to Publish Income-Tax Returns of United States Officials

EXTENSION OF REMARKS OF

HON. EDWARD MARTIN

OF PENNSYLVANIA

IN THE SENATE OF THE UNITED STATES
Monday, October 1, 1951

Mr. MARTIN. Mr. President, I ask unanimous consent to have printed in the Appendix of the Record an editorial entitled "A Cheap Political Trick," published in the Oil City (Pa.) Derrick of September 28, 1951, relating to the President's appeal for the enactment of a law to expose the total incomes of all top United States officials.

There being no objection, the editorial was ordered to be printed in the Record, as follows:

A CHEAP POLITICAL TRICK

Yesterday's appeal by President Truman for enactment by Congress of a law to expose the total income of all top United States officials bears the nauseating taint of a wormy and overripe political apple.

The President told the lawmakers it should be spread on the public record how much money, gifts, or loans are received by those responsible for running the Nation. Such legislation, he contended, is an important step to prevent improper conduct and guard against unfounded suspicions. Further, the little man acclaimed, the truth should be known partly because there has been a deliberate effort to discredit the Government service.

What nonsense. What political skulduggery? Who does Mr. Truman think he's fooling?

The record already is clear and it is being added to daily. It is a record of corrupt and dishonorable practices by many persons in the Government service. It is a record of total disregard for ethical standards by many in high places. It is a record of the ebb of public morality to an all-time low and an alarming deterioration in integrity of government.

The sordid story is not new. For months on end there has been a gradual unraveling of the "goings on" of many in places of trust. Mr. Truman has been fully aware of the revelations which have been unearthed largely by committees dominated by his own political party. In most cases he has met the revelations with a stony callousness and in some instances has gone so far as to label the charges asinine.

Why his sudden and grandiose move before the Congress? It certainly constitutes belated recognition of exposed corruption and political intrigue. And it can have but one interpretation--in the face of a steadily growing public wrath it is a deliberate attempt by the administration to cover up for failure to act in the past.

Mr. Truman is going to find it difficult to pass the buck to Congress. The American people are fed up with the kind of furtive undercover work that has been going on in Washington and there is a widespread disposition to place the blame for much of the sorry mess upon the President himself. It is contended that his obstinate loyalty to unworthy cronies binds him to their weaknesses and that this trait in the person of the President, who is expected to set an example of high moral standards, has encouraged his subordinates to indulge in questionable practices.

No misguided sense of loyalty can shelter any administration from going all out to correct the shabby practices which have been exposed and to get rid of those who have engaged in these practices, whether or not they are technically illegal. There is a certain sense of fitness which should characterize every public servant and if he does not possess this quality he has no business on the Government payroll.

The trouble with Mr. Truman's action yesterday is that it's too little and far too late. Of course, the mess must be cleaned up and public demand for correction of the exposed practices should be marked by an ever-rising crescendo.

The clean-up can't be accomplished by any cheap political trick by Mr. Truman. Nor can it be attained by incessant condoning of the exposed practices, which most certainly no longer are "red herrings" or asinine. It's going to take a thorough housecleaning in Washington--a complete eradication of those wormy individuals who have wriggled and squirmed their way into the national scene.

Taxation of Gambling

EXTENSION OF REMARKS OF

HON. ALEXANDER WILEY

OF WISCONSIN

IN THE SENATE OF THE UNITED STATES
Monday, October 1, 1951

Mr. WILEY. Mr. President, I send to the desk a brief statement which I have prepared opposing the Senate and House proposals for the taxation of gambling. I ask unanimous consent that this statement and the appended editorials be printed in the Appendix of the Record.

There being no objection, the statement and editorials were ordered to be printed in the Record, as follows:

STATEMENT OF HON. ALEXANDER WILEY, OF WISCONSIN, OPPOSING LICENSING OF GAMBLING

The American people do not quite realize as yet the unfortunate consequences of the Senate's action in sustaining the decision of its Finance Committee and of the House of

Representatives for the taxation of illegal gambling.

There have been some brief references in the public press, but not very much, to the fact that in H. R. 4473, there will be a tax of \$50 on each person who is engaged in wagering, a tax of 10 percent on the amount spent in an organized lottery where the people are not all present when the lottery is operated, and a tax of 10 percent of the amount that is bet with bookmakers.

I want to invite the attention of our people, however, to the very able presentations made on September 27 on the floor of the Senate by the distinguished first chairman of the Senate Crime Committee, Mr. Kefauver, by the able second chairman of that committee, Mr. O'Connor, and by my colleague, Mr. Hunt, on pages 12231 to 12244 of the RECORD.

My colleague from Tennessee pointed out very clearly.

1. These proposed Federal taxes, particularly the occupational tax on bookies, would, in effect, put the stamp of the United States Government's approval on gambling, a so-called occupation and activity, which is outlawed in 47 of the 48 States.

2. The proposed taxes are unenforceable.

3. Our Crime Committee suggestions on the other hand were both sound, desirable, and constitutional.

Supplementing the remarks of my colleagues, I say that surely the United States Government is not in such straitened financial circumstances that it must, in effect, "take a cut" and become a partner in illegal operations. If Uncle Sam is to start collecting taxes on illegal gambling, will he soon be asked to collect taxes on the illegal sale of narcotics? Or on a hundred types of other foul crimes just in order to collect revenue? Where will we draw the line?

Unfortunately, the Senate did not go along with the Senate Crime Committee's substitute amendment, which was defeated that day by a vote of 29 for to 49 against. The substitute amendment would have had the great advantage of, in effect, taxing illegal gamblers completely out of business. It would have first of all prevented the charging off of all expenses paid or incurred as the result of illegal wagering. That act in itself would have crippled America's gambling. It would have required gambling houses to keep detailed records of each wagering transaction, and it would have achieved other noteworthy advances against organized crime. But unhappily the substitute amendment was defeated.

On the following day, Friday, September 28, the Senate also defeated, unfortunately, by voice vote, the O'Connor amendment barring the deduction of business expenses incurred in illegal wagering, the Kefauver amendment relating to the keeping of records of illegal activity, the Kefauver amendment requiring records to be kept by wagering houses, and the Kefauver amendment eliminating that part of the tax bill dealing with wagering.

SENATE SHOULD HAVE FOLLOWED EXPERT ADVICE

It seems to me most curious that (a) the Senate rightly appoints a Special Crime Committee in May 1950, (b) that group makes a study of criminal operations throughout the Nation from then until September 1, 1951, (c) that group submits recommendations to the Senate (d) but whereupon the Senate turns down the expert recommendations of our special committee. I realize, of course, that the special committee's suggestions were considerably controversial and in many respects, quite novel. I realize, too, that the tax recommendations made by the Crime Committee by no means comprise all of that committee's suggestions. I am hoping that the Senate will adopt a more favorable attitude when it comes to those other recommendations which we made, particularly, on the subject of the rac-

ing wire news service. I do want to point out, however, that the Senate has had in effect a golden opportunity, as I see it, in connection with consideration of this tax bill—a golden opportunity to strike a body blow against organized crime in this country. To my way of thinking we have missed this opportunity, and we will not have it soon again. That is very unfortunate indeed.

COMPULSORY NET WORTH STATEMENT

The only bright spot in the picture as I see it occurred on Friday, September 28, when the distinguished chairman of the Finance Committee, Mr. George, announced that he would take to conference the modified Hunt amendment providing for the filing of a net worth statement by individuals who during the previous taxable year, received a gross income of \$10,000 or more from one or more unlawful trades or businesses. I wish that the original provision dealing with a period of 5 taxable years had been retained. That would have enlarged our dragnet against these criminals. However, I hope that the modified amendment at least will be retained in conference.

Now, insofar as the other amendments are concerned, let me say that it would not be fair if I were to give the impression that there are no advantages whatsoever to the approach which has been endorsed by the able members of the Senate Finance Committee and by the full Senate. I respect in particular the good intentions of the members of that committee. However, I think that such few advantages as do exist for their stand are more than outweighed by the disadvantages—moral and otherwise. Proponents of the bookie occupational tax and similar taxes contended that historically, under our tax law, we do not recognize any difference between income gained legally and that gained illegally. Yet we do recognize, for example, that a man cannot deduct expenses for committing a murder or performing some other crime against public policy.

It seems to me, moreover, that the evidence is quite clear that the payment of the Federal tax by an illegal operator has been regarded by that operator as a sort of "legal license." He has come to regard himself as a legitimate businessman who pays his Federal taxes, even though by this very act, he is signifying that he is violating State and local law.

LET'S ENCOURAGE RESPECT OF STATE AND LOCAL LAWS

I agree with my colleague from Wyoming [Mr. Hunt], who pointed out that it was in effect somewhat hypocritical to say the least for the United States Government to collect a one-hundred-and-fifty-dollar tax on slot machines at the very time those slot machines were outlawed in the respective States. Either Uncle Sam is trying to promote respect for State and local laws or he does not care whether those State and local laws are followed at all. I want to commend at this point the masterful argument made last Friday by my able associate from Mississippi [Mr. Stennis], who pointed out the moral implications of this problem.

I repeat. It is inconsistent for us to tell the States and localities on the one hand: "Go to it boys. The crusade against crime is your problem," and then on the other hand for Uncle Sam to tax, and in effect, legitimize the very illegal operation that he wants the States and localities to end.

That is an unfortunate message to splendid crusaders against crime like Dan Sullivan in Miami, Virgil Petersen in Chicago, Spruille Braden in New York, and to other public and private battlers against vice throughout the land, particularly the folks in voluntary anticrime commissions of the type I have mentioned and applauded in numerous public statements.

Now, I shall conclude my presentation.

EDITORIALS FROM TWO PAPERS

Quite a few American newspapers have commented on this Federal Government inconsistency and on the disturbing moral implications of the taxing and in effect—licensing of organized gambling. Two such newspapers are the Washington Times-Herald and the Milwaukee Journal. While these papers ordinarily are poles apart in their editorial thinking, they are united on this issue as are so great a number of our citizens. There follow then, three editorials from these papers, the first two are from the Thursday, September 6 and Thursday, September 27, issues of the Milwaukee Journal entitled "Tax on Gambling Unwise" and "Tax or Gambling License Fee." A third editorial is from the September 12 issue of the Washington Times-Herald, and it is entitled "Uncle Sam's Cut."

I hope that these and other editorials, together with the fine expressions of the American Bar Association on Organized Crime, will help awaken all of the Congress and all of the people to a realization of the implications of the Senate's and House's actions in the tax bill. In turn, we Senators who cosponsored the Senate Crime Committee's suggestions will carry on the battle for the objective which I have stated, namely the complete routing of organized crime.

[From the Milwaukee Journal of September 6, 1951]

TAX ON GAMBLING UNWISE

For 15 months the Senate Crime Investigating Committee has been exposing and denouncing gambling as a crime and a sin, but it apparently hasn't convinced the Senate Finance Committee.

The Finance Committee has voted to give gambling at least the aura of legitimacy by putting a tax on it. The committee accepted without change a House plan to levy a 10-percent take on bets handled by bookmakers and other commercial gamblers and a \$50 occupational tax on anyone who handles bets or numbers games.

Treasury Department officials have indicated doubts that the taxes can be collected but the Senators think that they will bring in \$400,000,000 a year.

Money isn't to be sneezed at in these days of high Government spending—but neither should it be sought at the expense of legitimizing crime. Gambling is illegal in most States. To treat it as a legitimate occupation, as a tax plan would, is to invite gamblers to break the law under Federal auspices. It is, further, to give official recognition to an activity that the Crime Committee has proved the big source of funds financing crime and corruption in America.

If the Senate Finance Committee doesn't care about the moral sources of tax money it shouldn't stop at gambling. Why not tax gang killers \$100 per murder or forgers \$1 for each check they manage to slip by a fraud victim? Why not tax prostitutes and narcotics peddlers and embezzlers? Crime is big business—if we're going to tax it, let's get it all.

We hope that the Senate isn't as indifferent as the House and the Finance Committee to the moral issues involved here. The job of Government isn't to make crime respectable—its job is to make it difficult or impossible.

[From the Milwaukee Journal of September 27, 1951]

TAX OR GAMBLING LICENSE FEE?

If the Senate approves the House plan to tax gambling and the tax becomes law, it may be the opening wedge for legalized gambling in many of the 48 States.

The mere assessment of a tax by the Federal Government, of course, would give a cloak of legitimacy to activities illegal in

most States. But the measure could have even more widespread effects.

It is estimated that the tax will raise \$400,000,000 a year—if anyone can figure out a way to collect it fully. The plan exempts gambling licensed by States—such as parimutuel betting and Nevada's wide open legal gambling. The sight of the Federal Government cashing in on a new source of revenue could conceivably lead States to legalize gambling so that they could do the collecting themselves.

This, of course, is what many professional gamblers hope. Their take on gambling could easily cover licensing fees and taxes if they could escape some of the graft payments they now have to make to stay in business.

The gambling tax plan, much as the Government needs money, is an unwarranted legitimization of an activity that is illegal in most States. It deserves defeat by the Senate or, failing that, a Presidential veto.

Certainly the Senate Criminal Committee has produced enough evidence of the corruption that thrives with gambling. Certainly Federal law should not give that corruption back-door support.

[From the Washington Times-Herald of September 12, 1951]

UNCLE SAM'S CUT

The Senate Finance Committee has voted for a 10-percent tax on bets placed with a bookmaker and for a \$50 license fee on bookmakers. The House had already approved these taxes. They are expected by those who favor them to bring something like \$400,000,000 a year to the Federal Treasury.

In all the States but Nevada and perhaps one or two others, the kind of betting to be taxed is illegal. Thus the bill is intended to take for the National Government a share of the profits of a business declared to be criminal by almost all of the States, and the backers of the proposal make no bones about this. They recall that the Federal Government taxes incomes, no matter how obtained, and ask why it should be squeamish about extending this profitable system.

The question arises why the principle shouldn't be extended even a little farther. The State treasuries also are short of funds, and might pick up a good many million dollars by taxing some of the activities and occupations which the Federal Government has outlawed.

A lot of people are said to cheat the National Treasury on income taxes. The States might turn this to profit by imposing a tax—say 10 percent—on the amounts obtained through fraudulent returns. The rate, of course, should not be so high as to discourage income tax cheating but, even so, might be expected to yield a good many millions of dollars for the support of State penitentiaries, universities, and lunatic asylums.

Then there is counterfeiting. As the profits of this form of enterprise approximate 100 percent of the gross receipts, a 25 percent State tax could be borne by the enterpriser without driving him into legitimate business. A 5 percent tax on bootlegging, so we have been informed by some good friends from Tennessee, would solve the State's fiscal problems forever. The profits derived from violating the Mann Act are also ripe for taxation by the States.

All of this illustrates the moral flexibility of our Federal system. This advantage seems not to have been sufficiently stressed by the authors of the federalist papers; foresighted though they were, they lived in the horse and buggy age and couldn't foresee all the ethical splendors that lay ahead. It didn't occur to the fathers that the Federal Government's meat could be the State governments' poison, but we of the New Deal era are wiser and know that all is for the best and most moral in the best and most moral of worlds.

Administration of Gov. Luis Muñoz-Marin, of Puerto Rico

EXTENSION OF REMARKS OF

HON. FRED L. CRAWFORD

OF MICHIGAN

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. CRAWFORD. Mr. Speaker, about 2 weeks ago, our colleague, WILLIAM C. LANTAFF, of Florida, inserted in the Appendix of the CONGRESSIONAL RECORD, a report condemning the administration of Gov. Luis Muñoz-Marin, of Puerto Rico, as a complete dictatorship.

Let me say that the attack levied in the report was not only unfair to Governor Muñoz-Marin under whose leadership the Puerto Rican people have been endeavoring to better their economic and social conditions, but I am of the opinion some special interests are attempting to benefit through misrepresentation.

The report was originally represented as being rendered by the TIES Association of Miami, and it was indicated that the survey resulting in the report was made under the sponsorship of TIES. The later developments indicate that, although the report was written by Chester Wright, Miami public relations man and recently elected president of TIES, that organization had taken no official action toward making the survey.

According to my information, TIES is a reputable organization of professional people, the letters standing for Technicians, Industrialists, Economists, and Scientists. Its purpose seems to be to keep its members apprised of business conditions and opportunities. TIES, according to my information, has never engaged in political battles and has always been a quiet and conservative organization limiting its activities to those of a laudable purpose.

Before the current session of Congress is concluded, and after I have had the opportunity to conduct some research, I intend to go into the matter of the Chester Wright report in some detail in order that the Congress which has the responsibility for passing upon general legislation affecting Puerto Rico may know the truth about Governor Muñoz-Marin's administration, but for the time being, since our colleague from Florida has inserted Mr. Wright's report in the CONGRESSIONAL RECORD, an effort to keep the RECORD straight and complete, under unanimous consent, I insert in the Appendix of the RECORD, as an extension of my remarks, an article which appeared in the Miami Herald, September 14, by Jack Thale, Herald staff writer. The article is as follows:

PUERTO RICO PROBE ORDERED—MUÑOZ ATTACK LAID TO POLITICAL FOES, BUSINESS INTERESTS

(By Jack Thale)

Business interests and political foes of Governor Muñoz-Marin were linked by the Herald Thursday to now-famed accusations that the Puerto Rican chief executive is operating a dictatorship under the American flag.

Leonard D. Long, a South Carolina contractor who in recent years has built more

than 10,000 low-cost dwellings on the island, emerged as a key figure in a tangled behind-the-scenes story.

Evidence sifted by the Herald indicated Muñoz had long in mind when he suggested that a private businessman may have inspired the highly critical report read by Chester M. Wright at a meeting of the TIES association here a week ago.

The Wright report touched off repercussions in Miami, Washington, San Juan, and various Latin-American countries. And the uproar was mounting.

While the Puerto Rican Legislature was setting up a committee to investigate the original and real motivations of the Wright report and additional civic and business leaders were coming to the defense of the Muñoz administration, a Herald investigation brought to light the hitherto unrevealed facts that:

Wright made his 2-week survey as an individual and not, as he previously announced, on an official survey for the TIES Research Foundation. Wright is president of the companion TIES organization of business and professional people.

The trip was suggested by Arthur E. Curtis, Miami publicist, who said Long is one of his industrial clients, and that the Charleston contractor has been having a lot of trouble with the Muñoz government.

Two men in Puerto Rico whom Curtis suggested Wright contact were Long and Jesus Pinero, former governor of Puerto Rico and political foe of Muñoz, who now works for Long.

While the various developments were taking place in Washington and San Juan on the report that created a sensation in Latin-American circles, the Herald learned steps were taken Thursday by the public affairs committee of the Miami Chamber of Commerce to have directors of the organization officially condemn the Wright report.

Coincidentally, the chamber officials learned during their discussion of the report that a chamber official had been approached earlier this summer with a proposition to make a survey of conditions in Puerto Rico for a fee of \$50 a day and all expenses.

Alfred B. Canel, director of the chamber's foreign trade committee, said, without naming any names, that the offer had been made to him and that he had turned it down after consideration.

Curtis, however, said no fee had been paid to Wright for his report. Wright said the money for the combined vacation and "survey" trip for himself, his wife and son "came out of my bank."

"However, I may yet join up with Arthur Curtis in the fight he is making for his client, Long," Wright added.

Wright, who had previously announced that he would make another "just as hot" report on Puerto Rico to the TIES meeting today, said Thursday he had decided to put off the second report. He said he would make it next week.

He conceded he had made a "mistake" in labeling his original report as "a report by Ties." He explained he should have called it a report "to" TIES. He said the organization had taken no official action toward making the survey, but that he had told Russell Edwards, president of the companion TIES research foundation.

Mimeographed copies of the report which Wright distributed last Friday set out that it was made "pursuant to prior agreement with the officers and according to a decision that a survey of Puerto Rican conditions was not only warranted but was urgent. It is now offered as a public document bearing the approval of the TIES research foundation."

Discussing how he happened to make his 13-day survey trip—this first visit to Puerto Rico—Wright said Curtis had suggested that he ought to check into "what's going on down there."

Wright, who said his interest in Latin-American affairs dates back 30 years although he speaks little Spanish, said he made the trip a sort of busman's holiday. He and his family stayed at the luxurious new Caribe-Hilton Hotel.

Wright said he talked to two or three people a day in his survey, estimating he spent about half his 13 days vacationing and half surveying.

Pinero, who was appointed as Puerto Rico's first native-born governor immediately preceding Muñoz' election as the first elected governor, was his host one Sunday during a trip through the Puerto Rican countryside, Wright said.

He said Pinero told him he was working for Long, but that they had no other discussion about the South Carolina contractor.

The TIES president said Pinero contributed only an infinitesimal part to his final report.

Wright said he had dinner with Long one night. He said Curtis had suggested he contact the contractor, but had not paved the way for the meeting.

"You don't need anyone to pave the way to meet Long in Puerto Rico," Wright commented. "You aren't there 10 minutes before you know about Long."

Wright said Thursday he stood by his original report and "I'm not backing up from it a bit."

He said that by the report he hoped "to wake up the Department of the Interior to a sense of responsibility about what is going on down there and to help Puerto Ricans achieve freedom of the press, which they don't have."

Four days after Wright's original report, Secretary of the Interior Oscar Chapman labeled the charges as "kind of silly," Muñoz previously had termed them "fantastic."

Chapman, pausing briefly Tuesday in Miami en route from Venezuela to Washington, told the Herald that Muñoz program of economic betterment for the island was "the healthiest thing that was ever tried down there, something which is going to increasingly pay its own way."

The Puerto Rican Legislature, which had been called into special session by Muñoz, spent most of its time Thursday talking about the Wright report instead of the legislative business for which it had been convened.

So deeply stirred were the legislators that some went so far as to propose a drastic press punishment law which would authorize the legislature "to prosecute any person who furnishes or publishes information that obstructs the plans of the government of Puerto Rico."

That the attitude of the Puerto Rican government would be strongly against any such measure was clearly indicated, however, when Muñoz was asked whether such a motion was approved.

"It should be unnecessary for me to answer that question," he told reporters. "However, I am going to answer it."

"It is obvious the legislature would not approve nor would the Governor sign any law of such a nature."

A leading banker-industrialist with extensive interests in Puerto Rico and Florida also rallied in Miami Thursday to the defense of the Muñoz government.

"The present government in Puerto Rico, under the leadership of Luis Muñoz-Marín, has provided better housing, raised the standard of living, and made vast inroads upon our unemployed multitudes by encouraging many new industries to locate in the island," declared Pedro J. Serralles, chairman of the boards of the Pan American Bank of Miami and the Crédito y Ahorro Ponceño bank chain in Puerto Rico.

Serralles, who served in the Puerto Rican Senate with Muñoz, is the eldest member of a family which operates the largest privately

owned sugar plantation in Puerto Rico. The family also owns and operates a huge rum distillery whose products are sold widely in the United States.

Muñoz came to power through "free, open, and honest elections" and his political and economic policies have been in line with those in the United States, Serralles said.

After taking over the regime of the former Gov. Rexford Guy Tugwell, an erstwhile New Deal braintruster, Muñoz "speedily removed from the island the ultraradical factors which might appropriately have been called communistic," Serralles commented.

Political Influence in the Bureau of Internal Revenue

EXTENSION OF REMARKS

OF

HON. EDWARD MARTIN

OF PENNSYLVANIA

IN THE SENATE OF THE UNITED STATES

Monday, October 1, 1951

Mr. MARTIN. Mr. President, I ask unanimous consent to have printed in the Appendix of the Record an editorial entitled "A Moral Defense Program Needed for America," from the Philadelphia Inquirer of September 30, 1951, relating to the use of political influence in the Bureau of Internal Revenue.

There being no objection, the editorial was ordered to be printed in the Record, as follows:

A MORAL DEFENSE PROGRAM NEEDED FOR AMERICA

With each day's news, more and more Americans wonder where we as a nation are headed. Our is an age in which public trust seems to be increasingly regarded as a private opportunity.

Most of us still believe in the maxim: "That which is morally wrong can never be politically right." Yet dissent comes from high places. Cast a glance at a sobering scene.

Democratic National Chairman Boyle sees nothing unethical or improper in accepting fees from clients doing business with the United States Government while he served as unpaid vice chairman of the Democratic National Committee. He seriously expects the public to believe he had no more influence with Federal agencies in Washington than any average citizen. President Truman still stands by him, and, in the opinion of many, timed his proposal to publish all official incomes on the day Boyle was to testify so as to divert the headlines.

Republican National Chairman Gabrielson admits seeking extension of an RFC loan, too. He also sees nothing wrong about it. Various RFC officials have been fired or have resigned. Others have confessed accepting expensive gifts from firms seeking RFC loans, and some could see nothing wrong about that.

Now the chief of the north California Internal Revenue Bureau and eight others have been suspended. The St. Louis collector of internal revenue, James P. Finnegan, who quit under fire, faces a grand jury probe. A GOP leader in Staten Island has resigned in the midst of a fixing and shake-down scandal in which a district attorney has been superseded. A similar sordid picture is found in Atlantic City * * * and one could go on and on, with the rotten Gross case in New York, the jail scandals in Camden, the football and basketball exposés, all over and above the revelations of the Kefauver committee.

The moral climate of America is at a low ebb. When men at high levels cannot tell right from wrong, it is time for them, and many of the rest of us, to become reacquainted with our churches and Sunday schools and the simple faith of our fathers.

Let us not forget that those who seek to corrupt are as guilty as those corrupted; that the giver of a bribe is as venal as the taker; that the patron of the racketeer contributes to the pollution of his own community, and that in the last analysis the ethical standards of a democracy will be what the people—each and all of us—insist upon.

We are spending billions to defend American principles against enemies from without. What America needs now is a moral defense program to protect those principles against destruction from within.

The Tax Load

EXTENSION OF REMARKS

OF

HON. T. MILLET HAND

OF NEW JERSEY

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. HAND. Mr. Speaker, under this title the Bridgeton Evening News has commented on a recent and excellent statement by former Assistant Secretary Roswell Magill, and the analysis given should be of great interest to all the Members.

This article is written by Wylie E. Middleton, who for some years has been doing very clear thinking and very clear writing on current problems of government.

I think it worthy of note that when this excellent editorial was written, Mr. Middleton was about to celebrate his ninetyeth birthday. He is doing more and better work than most people half his age.

The above-mentioned follows:

THE TAX LOAD

Mr. Roswell McGill, a former Assistant Secretary of the Treasury and now head of the Tax Foundation, in a recent subject of taxation, asserted that local, State, and national taxes now take one-fourth of the income of a man earning \$3,500 and if the Government got all the money it wanted—\$10,000,000,000 more from the individual income tax—it would have to take \$6,000 out of the salary of a man earning \$10,000 a year and if he earned \$15,000 it would take \$11,000. It would have to take all taxable income over \$4,000, yes, a 100 percent income tax on taxable incomes over \$4,000.

This is a startling but very plain statement and should convince thousands of individuals that instead of working for their own wages they are working first of all for the Government and they will get what is left.

Thousands of these people thus working for the Government do not realize the truth of these figures because they have not stopped to analyze them, but Mr. McGill's figures should open their eyes to the situation and set them to doing some analyzing for themselves. If what they discover does not start them to work to remove the cause of this tax burden, then they well deserve to be lied by the Truman policy.

Despite all statements to the contrary by such experts as Mr. McGill, President Truman continues on his course, refusing to yield a point or even to admit that those who

differ with him have any knowledge on which to base their conclusions or even know what they are talking about. His Government budget is a good one merely because he says so.

In a recent address at the dedication of the new accounting building in Washington, the President took occasion to say that his huge budget, which Congress is desperately trying to find the money to meet, is a good one and has been pared down and made as economical as it is possible for a budget to be made and that those who argue to the contrary are merely conducting a smear campaign.

That this is a misstatement of the truth, is proven by the fact that Mr. Truman has not adopted and put into operation the full report of the Hoover Commission for the reorganization and more and more economical conduct of the national Government, a report which Mr. Truman approved himself.

Congress has cut one and one-half billion dollars from this budget, but it should have cut much more. Instead of lying awake nights to think where the money could be found to meet the budget, it should have let the President lie awake nights trying to find a way to bring his budget within the money Congress was willing to give him.

Congress has been remiss in that it has done too much talking about cutting the budget, but not enough actual cutting.

Talk does not reduce the tax load.

W E M.

Less Steel for Farmers Hurts Defense Effort

EXTENSION OF REMARKS OF

HON. ROBERT B. CHIPERFIELD

OF ILLINOIS

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. CHIPERFIELD. Mr. Speaker, under leave to extend my remarks in the Record, I include the following editorial from the Moline Daily Dispatch of September 24, 1951:

LESS STEEL FOR FARMERS HURTS DEFENSE EFFORT

Unless the National Production Authority changes its absurd policy of cutting down the amount of steel available to the farm-equipment industry, American farmers about this time next year will begin feeling a serious pinch in new equipment and in parts for repairing old equipment.

But that isn't all.

Less farm machinery will mean less farm production. Less production means less food and fiber for the domestic market, for the armed services, and for the foreign market.

And less farm machinery means less for export to the free nations we're trying to help. And that in turn means a cut-back in overseas production of food and fiber.

The Department of Agriculture estimates that the farm-equipment industry will need from 2,700,000 to 3,000,000 tons of steel next year to produce machinery which the farmers must have.

The allocation for the third quarter of this year was 673,000 tons. The allocation for the fourth quarter is 528,000 tons. And the NPA has announced it intends to cut the allocation even more for the first quarter of 1952.

Indications are, therefore, that the farm-equipment industry will get less than 2,000,000 tons total next year if the NPA doesn't awaken to the facts.

That's only two-thirds or less of what the Department of Agriculture says is minimum for production needs.

What are the facts?

Increased farm production is needed for our Armed Forces.

Even with partial mobilization military food and fiber needs are greater. Military kitchens must be backed up with 7 to 9 month stocks, civilians need only 7 to 9 days.

Men in uniform eat far more than civilians—for example, twice as much meat.

Right now the military requires that 9 percent of the Nation's canned fruits and vegetables be set aside to provide for 3,500,000 men—only 2½ percent of our population.

Increased farm production is needed to feed civilians.

Our country is growing, and that means the need for food is growing. The civilian population of the Nation consumed 14 percent more food in 1945 than it did in 1940. It consumed 16 percent more in 1950 than it did in 1945. By 1955, it is estimated, the consumption rate will be 12 percent greater than it is this year.

Increased farm production is needed to help keep friendly nations friendly.

The Nation's volume of agricultural exports this year required the cultivation of an estimated 50,000,000 acres of land, representing about one-sixth of the total of all cultivated crops in the Nation. We cannot fail to continue to help feed the people who are on our side against the Communist bloc.

Increased farm production is needed to fight inflation.

Food is the biggest single item in the family budget. In recent years the consumers have been spending a little more than a fourth of their disposable income—income after taxes—for food. What happens to food prices, then, has important influence on family spending, affecting the entire price and wage pattern of our economy.

The increasing demand for food naturally acts to advance food prices unless supplies also increase. With consumers' disposable incomes on the rise and the supply of durable goods going down, there is more pressure than usual behind food prices. And the surest way to lessen that pressure on prices is abundant production.

Those are some of the big facts which the NPA should have to swallow before cutting back steel supplies for farm machinery. And there are many other facts, if Defense Production Administrator Charles Wilson's boys will take a close look.

Sure, there's a steel shortage. At least, they tell us there is. Sure, we have to pick and choose among steel consumers in the interest of national defense.

But, as Senator BOURKE B. HICKENLOOPER, Republican, Iowa, told the Senate in a bitter and blunt speech the other day, "food is quite as important as guns."

The NPA makes a serious mistake if it does not recognize that.

Unification of Ireland

EXTENSION OF REMARKS OF

HON. THOMAS B. CURTIS

OF MISSOURI

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. CURTIS of Missouri. Mr. Speaker, I am inserting into the Record a letter I received from the State Department in response to my inquiry in regard to our national policy on the subject of the unification of Ireland. I did not receive it in

time to call it to the attention of other members who might have felt it was pertinent in the debate concerning House Resolution 82. I mainly wanted the information for the benefit of my constituents who were writing me on this subject, and I thought other Members might still be interested in it:

SEPTEMBER 27, 1951.

Hon. THOMAS B. CURTIS,

House of Representatives.

MY DEAR Mr. CURTIS: The receipt is acknowledged of your letter of September 21, 1951, inquiring whether the Department of State has adopted any policy in regard to the unification of Ireland.

The Department of State has long been aware of the questions arising from the political status of Northern Ireland and has given the most careful consideration to the bearing of those questions on the relations of the United States with the Republic of Ireland and the United Kingdom, two of this country's closest friends. The Department is convinced that a real and lasting settlement can only be achieved by the Government of the two countries directly concerned. It is believed that this is not a matter in which the United States could properly or usefully intervene.

Sincerely yours,

JACK K. McFALL,

Assistant Secretary

(For the Secretary of State).

Henry Bell, an Outstanding Leader of Texas and Our Nation

EXTENSION OF REMARKS OF

HON. LINDLEY BECKWORTH

OF TEXAS

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. BECKWORTH. Mr. Speaker, a great man and leader of Texas and the Nation, Mr. Henry Bell, died in Texas recently. It is accurate to say Mr. Henry Bell's death is a great loss to our Nation. People throughout our Nation knew and admired him and feel keenly the great loss which has been sustained because of his passing. I desire to include in the CONGRESSIONAL RECORD an appropriate and fitting tribute to him:

HENRY MARSH BELL

"The record of a generous life runs like a vine around the memory of our dead, and every sweet, unselfish act is now a perfumed flower"—R. G. Ingersoll.

Somehow we die a little too when we say good-bye to a congenial and treasured friend. The empty void that is left us in our aching hearts by the absence of our vanished comrade seems to be beyond repair. The poignant pain of parting makes us wonder at the wisdom of the great Architect of fate. Why should a great and useful man be taken in his prime when so many walk the earth with aimless, selfish uselessness and render no service to mankind to pay the rent for the space they occupy?

Yet in the midst of sorrow, the faith that we must keep to sustain us in such hours calls us to carry on as he would have us do. Henry Bell, struck down at the peak of his power for good in east Texas, would tell us now if he could speak, to get on with the job of building a greater east Texas, to make our lives finer in their ministry to others and to widen the area of our interests.

This patron of progress who was the inspiration for so many projects and movements for the upbuilding of his home town and his State, had a rare zest for living. Whether he was dealing with a problem of finance for his bank, giving a helping hand to a Negro school, urging the football team to new victories, aiding the chamber of commerce toward new goals, or conferring with the rector of his church, he was always understanding, helpful, and inspiring. His memory is a benediction.

He left us a lesson that other great souls have tried to teach us, to increase our wholesome interests in life, to be a constructive part of all that is good around us, and that happiness comes from helping others. There are those who take no part in any worthwhile activity. They have narrowed the sphere of their interests until they are only partially alive. They are wasting their lives and killing time. Henry Bell lived a busy, useful, interested, wholesome, many-sided life that carried his influence into an endless variety of activities and touched the lives of the great and the humble in a wide circle.

Henry Bell's memory will never die. It will go marching on to call east Texans to new heights of achievement, its rallying call still clearly heard by those of us who knew him well.

The charm of his personality cheered and blessed everyone who came within the warm glow of his genial heart. We thank God that we were privileged to enjoy his friendship and that east Texas had him as a beloved leader for a little while.

HUBERT M. HARRISON.

Railroad Retirement Legislation

EXTENSION OF REMARKS OF

HON. GARDNER R. WITHROW

OF WISCONSIN

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. WITHROW. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following letter recently received from the four brotherhood chiefs relative to the pending railroad retirement legislation.

WASHINGTON, D. C., September 26, 1951.
To all Senators and Members of the House of Representatives.

HONORABLE SIRS: The four transportation brotherhoods—Brotherhood of Locomotive Engineers, Brotherhood of Locomotive Firemen and Enginemen, Order of Railway Conductors, and Brotherhood of Railroad Trainmen—favor the enactment of the amended bill, H. R. 3669, reported favorably by the majority of the House Committee on Interstate and Foreign Commerce.

Retired railroad employees and survivors of deceased railroad employees are sorely in need of an increase in their fixed low incomes on which they are now struggling against the highest living costs in the Nation's history to live in decency and with some slight degree of comfort. This national appeal for financial aid from this group of retired railroad employees who devoted the working years of their lives to the task of handling the commerce of this country, including the transporting of our soldiers, supplies, and weapons of war in two world conflicts we believe is entitled to sympathetic and immediate consideration by the Congress of the United States, with (1) no increase in present tax rates or taxable wage limits, and (2) with preservation of the financial soundness of the railroad retirement system without impediment of possible de-

feat by injection of controversial "fringe" amendments of questionable soundness.

We originally suggested a 25-percent increase in benefits, but actuarial testimony presented before the Senate Committee on Labor and Public Welfare and the House Committee on Interstate and Foreign Commerce persuaded us to modify our original proposal in order to keep the fund within the realm of actuarial soundness.

The work performed by transportation employees is extremely hazardous. The number of accidents is high and occupational disability frequently results in disqualifying such employees from service. In such cases benefits are paid under the Railroad Retirement Act. No similar benefits are paid under social security or other retirement systems. Involvement to any degree with other pension or old-age retirement systems is of grave concern to the transportation brotherhoods.

The Transportation Brotherhoods pioneered in the development of the present railroad retirement system to which their members look with confidence and security for financial assistance when seriously injured in line of duty or when they have reached the winter of life. Our railroad retirement system is maintained without one penny of cost to the public and without interference with other pension or old age retirement systems, and we express the sincere hope that the Congress will not enact legislation that will in any manner arbitrarily involve our railroad retirement with other pension or retirement plans.

The thousands of men and women now dependent upon railroad retirement benefits are in need of an increase, which Congress should provide without delay. If any of the controversial fringe amendments now pending—whether intended to expand or contract the rights or benefits under the Railroad Retirement Act—are considered by Congress to be of sufficient importance to warrant serious consideration, then may we suggest that Congress grant immediate increases in benefits and later provide an opportunity for a thorough investigation of all controversial matters at which all interested parties will be accorded an opportunity to be heard.

Respectfully yours,

J. P. SHIELDS,
Grand Chief Engineer, Brotherhood
of Locomotive Engineers.

D. B. ROBERTSON,
President, Brotherhood of Locomotive
Firemen and Enginemen.

R. O. HUGHES,
President, Order of Railway Con-
ductors.

W. P. KENNEDY,
President, Brotherhood of Railroad
Trainmen.

Tribute to Emil Rieve, General President, Textile Workers of America

EXTENSION OF REMARKS OF

HON. CLEVELAND M. BAILEY

OF WEST VIRGINIA

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. BAILEY. Mr. Speaker, on September 29, in Boston, the Textile Workers Union of America paid tribute, at a testimonial dinner, to Mr. Emil Rieve, president of that organization. It seems only fitting, then, at this time, for the Members of Congress to laud the achievements of this man who has pi-

oneered in the field of labor in an effort to create one of the finest groups in the Congress of Industrial Organizations.

When other labor organizations insisted that it was impossible to build a textile union, they proved themselves wrong; and now, with the accomplishments of Emil Rieve, the Textile Workers Union numbers 450,000 strong. Wages have more than tripled during his administration.

More than that, though, Mr. Rieve has served in two of our Nation's greatest crises. During World War II, he worked unceasingly as a member of the War Labor Board. Now, with our country again engaged in a major defense effort, he contributes tirelessly, once more, as a representative on the Wage Stabilization Board.

Emil Rieve has added to the principles of all labor—national and international—as well as to the standards of our democracy. He is a real American, with the heart of a humanitarian, who works for the people.

Defense Rebuilds Economy in South

EXTENSION OF REMARKS OF

HON. JOSEPH R. BRYSON

OF SOUTH CAROLINA

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. BRYSON. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following article from the New York Times of Monday, October 1, 1951:

DEFENSE REBUILDS ECONOMY IN SOUTH—MILITARY RESEARCH PROGRAMS ASSURE FUTURE DEVELOPMENT, INDUSTRIAL SURVEY SHOWS—BECOMING ARSENAL OF UNITED STATES—BUT GREATEST BENEFITS ARE SEEN IN NEW TECHNOLOGICAL SKILLS DEVELOPED AMONG PEOPLE.

CHATTANOOGA, TENN., September 30.—The South's development as a primary field of research in military programs for national security already assures the region of a major role in future scientific and industrial activities, the Southern Association of Science and Industry reported today.

In releasing a survey of the South's total research forces "that are rebuilding the economy of the region," the association declared "the South, which one knows militarily, only for its generals and its gun cotton, is fast becoming the Nation's arsenal for superweapons and industrial essentials."

"The South is busy converting the byproducts of military research programs into new developments for industry and agriculture," H. McKinley Conway, Jr., director of the association, declared.

NEW TECHNOLOGICAL SKILLS

"There is ample evidence," he said, "that the greatest economic benefit to the South from all the big military projects lies not in the millions spent for construction and operation, but in the development of new technological skills among the people of the region."

"These projects have brought into the South large numbers of the Nation's top scientists, and their influence is being felt throughout the scientific community particularly the universities."

"In many a hitherto sleepy southern town, research chemists now rub shoulders along the sidewalks with tenant farmers who are rapidly being swept from their perpetually

losing struggle into a world of new economic opportunity.

"Also, this expansion of high-level technical effort has made it possible to reduce the export of the South's most valuable resource, which is the more talented young graduates of its colleges and universities."

The report cited such vital military research centers as the atomic energy plant at Oak Ridge, Tenn., the hydrogen plant at Ellenton, S. C., the long-range proving ground for guided missiles near Melbourne, Fla., the Arnold Air Engineering Development Center at Tullahoma, Tenn., the rocket and jet propellant installations at Huntsville, Ala., and Dalmierfield, Tex., and testing laboratories along the Atlantic Coast for underwater weapons and special climatic conditions at sea and in the air.

AUXILIARY EQUIPMENT MADE

The auxiliary equipment which includes electric motors, refrigerating units, turbines, compressors, jet combustion chambers and nuclear fission tools, all built and operated on a scale that exceed anything in American industry will attract many of the country's top engineers and further the cause of science in the South, the association reported.

The association noted that since the beginning of the defense mobilization program prompted by the Korean war, more than 150 new million-dollar plant additions have been reported in 14 Southern States, with some units involving investments of more than \$50,000,000 each.

It also pointed out that 65 southern colleges and universities are now authorized by the Atomic Energy Commission to receive radio-isotopes from Oak Ridge for use in various experimental programs. More than 4,000 shipments of radio-isotopes have already been made from Oak Ridge to scientific groups in the Southern States, the report added.

Reinforcing these military-sponsored technological advances as they affect the southern economy, the association reported, is a rapid expansion of regional industrial research that has resulted in the establishment of 40 consulting laboratories to assist local businessmen, whereas there was not one major consulting laboratory in the South a decade ago.

The report cited the development and growth of multi-million-dollar agricultural and industrial enterprises based on new synthetic fibers and plastics made from the chemical processing of corn, cotton, and oat wastes, new techniques for utilizing forest products as animal feed, fuel, and newsprint; a mushrooming petio-chemical activity that is expected to reach an investment figure of \$1,500,000,000 by 1955.

The report also set forth that from 1930 to 1947 there were established in the South more than 16,000 new manufacturing plants and that in the past decade the region has added more than 1,000,000 new jobs in manufacturing. In such significant economic indexes as wages, electric power consumption, and telephone installations, the association reported, the South has led the Nation percentage-wise in increases.

Retain the Andresen Amendment to the Defense Production Act of 1950

EXTENSION OF REMARKS OF

HON. WILLIAM K. VAN PELT

OF WISCONSIN

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. VAN PELT. Mr. Speaker, I want to call to your attention and to the at-

tention of Members of the House that the Andresen amendment to the Defense Production Act of 1950 is being attacked by foreign-government trade associations, embassies, and American importers. I supported this amendment and vigorously urged the adoption of it because it was the best method of giving our dairy industry and our cheese industry much-needed relief, particularly the processors of foreign-type cheeses which have been undersold by the imports.

A continuation of unlimited importing of foreign types of cheese would bring very disastrous results to our domestic producers. Foreign cheese in many instances is not made under the strict laws and standards that protect the health of our Nation. Our labor costs are many times higher than those of foreign competitors. The volume of blue-mold cheese from Denmark alone and Italian varieties from Argentina and Italy came very near annihilating this American industry. To date no action has been taken by the Tariff Commission in this regard. Meanwhile, the Andresen amendment to the Defense Production Act of 1950 does give them a measure of relief. The Department of Agriculture DFO No. 3 under this act sets up quotas that far exceed being just fair to the exporting countries.

The American producers of variety cheeses—other than Cheddar—consists of some 40 companies, located mostly in rural areas, offering the only local employment to perhaps 5,000 families. The milk supply of the United States producers comes from farmer patrons which could easily number as many as 20,000 farmers across the Nation.

The following is an example of the effect unrestricted imports of foreign varieties of cheese have had on an outstanding company in my district: This company has been in the business of manufacturing variety cheeses since 1934. It grew to have almost 100 employees working the milk from 385 patron farmers. The importation of like varieties of cheese from Europe has forced them to reduce the number of employees to 54 and patron farmers to 255. They carried inventories averaging in excess of 1,000,000 pounds of cheese per month until mid-year 1949 when the volume of imports forced it to reduce employment, production and inventories by roughly 50 percent. The sheer weight of importations during 1950 and the first half of 1951 came very close to wiping out what was left of this company's business.

The following figures clearly demonstrate the fate of the United States industry as of the moment—compiled from reports of the United States Department of Agriculture:

United States production blue mold cheese		Imported Roquefort	Imported blue mold cheese
1948.....	8,280,000	852,000	977,000
1949.....	8,141,000	1,392,000	1,301,000
1950.....	7,050,000	1,641,000	3,492,000
January to April 1951.....	2,100,000	608,000	2,270,000
Average 1939 to 1950.....	9,028,000	1,306,000	888,000

Therefore, the Andresen amendment to the Defense Production Act of 1950

must remain in force and effect if our dairy and cheese industries are to survive and furnish steady employment to our people.

An Open Letter From Robert C. Townsend

EXTENSION OF REMARKS OF

HON. JOHN PHILLIPS

OF CALIFORNIA

IN THE HOUSE OF REPRESENTATIVES

Monday, September 24, 1951

Mr. PHILLIPS. Mr. Speaker, the Townsend National Weekly contained, in its issue of September 18, an open letter from Mr. Robert C. Townsend, in which he calls attention to a clause in the Social Security Act tending to discourage millions of citizens from taking available jobs.

I agree so thoroughly with Mr. Townsend that I include his letter with these remarks, and I have introduced H. R. 5427 in an effort to have the matter discussed in the proper committee, and eventually to have the situation corrected. The letter follows:

AN OPEN LETTER TO ALL MEMBERS OF CONGRESS

Despite the fact that the demand for workers is at an all-time high, there is a clause in the present Social Security Act that discourages millions of United States citizens from taking the jobs that are available.

Despite the fact that living standards were never higher for the majority of the people of the United States, there is a clause in the present Social Security Act that has the effect of making poverty compulsory for millions of United States citizens.

This clause that provides that Federal-State welfare agencies "shall, in determining need, take into consideration any other income and resources of an individual claiming * * * old age assistance, aid to the blind, aid to the disabled, or aid to dependent children.

Under this clause, as it is interpreted by most State welfare agencies, every dollar earned by a welfare recipient must be reported and is deducted from his or her dole.

The results are: (1) welfare recipients have no incentive to become self-supporting, (2) if they do take a part-time job their income from the assistance program is adjusted downward so that their total income remains at the poverty-level of assistance allowances.

I do not think that I am being an alarmist when I say that it is urgent that this clause be amended immediately, more than 5,000,000 United States citizens are caught on this "treadmill of poverty."

The clause that must be corrected is clause 7 of subsection "a" of section 2 in the Social Security Act, and its counterparts, clause 7 of subsection "a" of section 402, clause 8 of subsection "a" of section 1002, and clause 8 of subsection "a" of section 1402.

The clause should be amended in such a way as to require Federal-State welfare agencies, in determining need, to disregard the first two-thirds of the welfare recipient's earned income. In operation, this policy would require welfare agencies to deduct \$1 from the welfare allowance for each \$3 earned by the welfare recipient, thus permitting the recipient to gradually become self-supporting if he or she is able to do so.

Details of how such a policy would work are contained in the banner story on this page.

I cannot urge you too strongly to devise such an amendment to the Social Security Act. While you are working on this reform measure, millions of man-hours are being lost to industry, and millions of citizens have no way of escaping their poverty, because of this defect in the Social Security Act.

ROBERT C. TOWNSEND,
Treasurer of the Townsend Plan for
National Insurance.

Mrs. Mabel Cory Costigan

EXTENSION OF REMARKS

OF

HON. BYRON G. ROGERS

OF COLORADO

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. ROGERS of Colorado. Mr. Speaker, under leave to extend my own remarks, I include in the Appendix of the RECORD two articles, one which appeared in the Rocky Mountain News and the other in the Denver Post, both reflecting the passing of Mrs. Mabel Cory Costigan, an outstanding American woman.

It was my pleasure to know Mrs. Costigan during her lifetime. She was loved by all who knew her. She was patient, kind, and devoted to her duty in assisting her husband, the late Senator Edward P. Costigan, who represented my State from 1931 to 1937. She will be missed by her many friends.

The articles follow:

[From the Denver (Colo.) Rocky Mountain News of September 24, 1951]

WE LL MISS HER QUIET, FIRM VOICE
(By Robert L. Chase)

The soft, quiet counsel of Mrs. Mabel Cory Costigan will be missed for a long, long time in Colorado.

Already it seems strange and unreal to think of tasks being undertaken and human causes organized without the firm and steady hand of Mrs. Costigan helping somehow to guide the project.

Mrs. Costigan—as was the late Senator Edward P. Costigan—was a liberal when that name meant something. And nothing in life ever swerved her from the chosen course.

I first met Mrs. Costigan just over 20 years ago when her husband was a candidate for the United States Senate.

Senator Costigan had long before chosen the road he was to travel. He had chosen when he defended the miners accused at Ludlow. And Mrs. Costigan had chosen with him, chosen as she always chose to stand stanchly beside him through anything that might come.

There had been a beautiful romance, which began when he was class president and she class secretary at East High School. All through their years together, Mrs. Costigan was a real but silent partner.

She was always completely with him in everything he undertook, yet never obtrusively.

Occasionally, though far too infrequently, it was my good fortune to come in contact through the later years with Mrs. Costigan. Always it was when there was something to be done for people, for ordinary people, for underprivileged people, for outnumbered people.

Always there were two things you could be certain about. Mrs. Costigan would make

her decision entirely without regard for her own personal gain—often without regard to her own personal cost. And she would take her stand without the slightest personal animus—usually with a smile.

Sometimes people got an idea Mrs. Costigan was too quiet, too kind to stand up for her own beliefs if enough pressure could be applied.

How wrong those people were.

Not that Mabel Costigan ever lost her temper, ever pounded the table, ever screamed or shouted.

But she could shake her head, usually sadly, and say "No." And no it was, when she said "No."

Mrs. Costigan did not like to be used. She had been a liberal when it meant something to be a liberal. She had seen the world taken over and had seen it twisted out of shape and out of meaning. And she didn't like that.

But Mrs. Costigan never lost faith in people, never lost her willingness to fight the good fight for anybody she believed was right and needed her help.

The list of people who will miss her kindly counsel, her help, is a long one.

[From the Denver Post of September 23, 1951]

Mrs. COSTIGAN

The quiet power of righteousness as a social and political force was never better demonstrated than in the life and work of Mabel Costigan, one of Denver's most distinguished women. Her distinction was not achieved in the limelight of public office or the noisy arena of affairs. It derived, rather, from unobtrusive but tremendously effective work in behalf of better citizenship, wider political consciousness among both men and women, and social betterment for all.

Mrs. Costigan and husband, the late Senator Edward P. Costigan, were among the earliest pioneers of liberalism in this area, when to be a liberal or progressive was to be suspected of subversive designs on the traditional beliefs of grandfather and great-grandfather. They lived to see their own faith almost universally accepted.

A gentle and lovable woman, Mrs. Costigan continued almost to the end of her life to contribute from her own wisdom and devotion, to the political and social education of women, to a quickening of their citizenship. No one more truly deserves the title, "Great Lady."

Still Worst Congress

EXTENSION OF REMARKS

OF

HON. WALTER NORBLAD

OF OREGON

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. NORBLAD. Mr. Speaker, under leave to extend my remarks, I include herewith the following editorial from the only metropolitan Democratic newspaper in the Pacific Northwest, the Oregon Journal, of Portland, Oreg., entitled "Still Worst Congress":

STILL WORST CONGRESS

The Eighty-second Congress (which we gave a "worst" tag last May) will have to get on its horse if it makes its date with that long-deferred vacation October 1. Right now prospects aren't good.

To be frank, the Congress is paying for the rash of investigations, bickering, great debates, and political horseplay that have been its trade-mark since last January.

About all the unwilling Congress has to show for 9 months of stalling around (we almost said work) is a scaling down, some good, some bad, of the administration's requests for measures designed to grapple with international crises and internal pressures such as inflation.

And with the military appropriations bill, foreign aid, tax legislation, aid to Nationalist China, statehood, and the Japanese and other treaties still on the hook, this scaling down and dodging process continues.

Here's the record:

The Eighty-second Congress already has scaled down the war housing, Voice of America, National Science Foundation, civilian defense, and economic controls program. Some, like the housing, civil defense and economic controls programs, have been scaled down almost to the vanishing point.

The Congress is now busily scaling down the foreign aid bill from the \$8,500,000,000 requested. This may prove to be most costly economy.

It is scaling down the \$10,000,000,000 tax bill to around \$6,000,000,000, despite the fact that the Treasury is running up a deficit of around \$4,000,000,000 already, with the worst yet to come.

And there is a thinly veiled threat on the part of some die-hard Republican Senators to stall the ratification of the Japanese Treaties until after the first of the year, important as speedy approval is. Thus another time-wasting great debate, rivaling the affair MacArthur and troops-to-Europe issue, may be in the offing, possibly extending into the 1952 political campaign.

On the record the Eighty-second Congress does not deserve a vacation. It hasn't earned it. At least it is consistent about one thing. It is living up to its "worst Congress" reputation.

Be a Good Sport, Uncle Sap

EXTENSION OF REMARKS

OF

HON. JOSEPH P. O'HARA

OF MINNESOTA

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. O'HARA. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following recent editorial from the Wadena Pioneer Journal, of Wadena, Minn. The writer of this editorial is our former colleague, Hon. Harold Knutson, who was a Member of the House of Representatives for over 30 years. His comments, I am sure, will be of great interest to his former colleagues in the House:

BE A GOOD SPORT UNCLE SAP

Uncle Sap, do you know that it's only 95 days to Christmas? Have you remembered to notify all the friendly countries abroad to get their orders in early for further help from us? Really, Uncle, some of our friends are in desperate straits and must have more help immediately. Ma England finds that she can't make both ends meet on a 35-hour-loaf week, now that everybody gets free teeth, eyeglasses, coffins, shrouds, and the many other blessings given them by their Socialist government.

She wants you to let her again welsh on what she owes you and you should give her the nod so as to not mar a perfect record for welshing that for 30 years has never known frustration.

Now, Uncle, don't spring a sour note by telling us that Ma England has already had \$35,500,000,000 from us since the war began.

You old tightwad it didn't cost you anything. All that jack came from the pockets of the American people and it only amounts to \$230 on each of us so "wattall." That's peanuts for us who are all supposed to be millionaires, and you know, old top, we must not destroy that illusion.

Uncle, it's so satisfying to be pointed out as a rich American when walking the streets of London and Paris, not to mention Norway, Denmark, Italy, Greece, Portugal, Yugoslavia, and scores of other little cousins we had never heard of and didn't know existed till after the war was over and they started fighting for a place at the free-lunch counter.

It will never do to let these friends know that we have to work to get the money you are so generously spreading among them. That might hurt our credit in case we should ever find it necessary to borrow from them.

Here's your chance to again show the world that you are not the dollar-chasing, money-loving old "bustard" you've so often been called by our less fortunate friends.

Uncle, be a good sport. Give the poor devils everything they ask for, as you have been doing the past 30 years. It only costs us 30 cents out of every dollar we take in to play Santa Claus to the world. Raise the ante and take 50 cents if necessary; pursue proud Americans will never know the difference, but once they find that their beneficence makes it possible for millions of foreign friends to live without working it will swell their hearts with joy, and to the exclusion of such sordid things as taxes "Wattall" you waitin' for—only 95 days to Christmas.

Democratic Administration Keeps Prices Up

EXTENSION OF REMARKS OF

HON. LAWRENCE H. SMITH

OF WISCONSIN

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. SMITH of Wisconsin. Mr. Speaker, the cry against high prices by Democratic spokesmen cannot be reconciled by New Deal administrators. When the prices on basic commodities begin to go down, Mr. Brannan rushes in to keep them up.

Mark Sullivan, well-known writer, cites several examples in his article that appeared in the Washington Post, September 30, 1951. I include it as part of my remarks:

ADMINISTRATION AIDS INFLATION

(By Mark Sullivan)

PROPS FOR PRICES

The present status of the price level and of inflation can be stated broadly, if perhaps over-simplistically, in two sentences. Prices are crying to come down, many important commodities having already come down markedly. The Government in Washington strives almost desperately to prevent prices from coming down.

The contending forces are illustrated concretely by recent developments about rice, reported in a dispatch from Lake Charles, La., to the Wall Street Journal. The price of rice has been declining sharply. Two years ago it was nearly \$7 per 100-pound bag, and as late as last June it was \$5.50. Today the

average price is estimated at about \$4.50. Likelihood of a still lower price is suggested by the size of this year's crop, coupled with the fact that a large portion of last year's crop remains unsold.

In this situation the Department of Agriculture steps in to support the price by taking a large quantity off the market at an artificial support price fixed by the Department at \$5 per 100-pound bag. "The Agriculture Department spokesmen are busily exhorting growers to hang onto their rice and put it under Federal price-support loans."

"The extraordinary nature of these loans is stated simply: 'By putting their rice under price support, the growers can hardly lose. They get a federally guaranteed bank loan at the \$5 a bag rate. If the market price rises above that point before the end of next April, the farmers can take back their rice and sell it. If the price doesn't go over the \$5 average, the growers can simply leave their rice under the loan and keep the money.'"

What the Department of Agriculture is doing about rice it is also doing about cotton and by the same or other methods is striving to prevent prices of many farm products from coming down.

Within roughly a year past a large number of important commodities of various kinds have fallen markedly in price, some almost sensationally. Examples are Tin, from a peak of \$1.83 a pound to \$1.03, rubber, from roughly 87½ cents a pound to 52 cents; cotton, from roughly 45 cents a pound to 34 cents; wool, from \$3.80 a pound to \$1.90, hides, from 43½ cents a pound to 30 cents.

Many of these commodities, and others that have fallen in price, enter into manufactures. But the effect of a fall in raw materials on prices of manufactured goods is offset by wages of labor, the tendency of which has been upward.

There has recently been a tendency for farmers to recognize that price support of farm crops at artificial figures by the Department of Agriculture is dubious economically and politically. Secretary of Agriculture Brannan recently warned farmers that Government policies favoring farmers are "being threatened by the attitude of the bulk of the people toward farmers." Many farmers and some farm spokesmen expressed willingness to forego some of the advantage which farmers receive through Government policies and practices. But usually they add a qualification, they are willing to sacrifice provided other groups sacrifice correspondingly.

When the new economic controls measure was before Congress last summer, the farm bloc in Congress fought bitterly against the "rollback" which the Administration price control agency had decreed in prices of beef. When the Administration agency dealt with wages of labor it moved in a contrary direction and used a contrasting terminology. During 1950 wages of labor in many industries had been raised an average of some 10 percent. The control agency decreed that such workers as had not shared in the 10-percent raise should now receive it. The action was called a "catch up" provision. It was natural that farm spokesmen should see discrimination in a "rollback" for them accompanied by a "catch up" for labor.

Some sacrifices on the part of labor accompanied by some on the part of farmers would go far toward checking a rising spiral of prices and accompanying inflation. The situation is complicated by the fact that we are on the eve of a campaign year for the election of a President, the whole House of Representatives, and a third of the Senate. There is so far no evidence of any formidable organized movement on the part of consumers in support of their interest.

The Proposed Aluminum Industry for Montana—II

EXTENSION OF REMARKS OF

HON. MIKE MANSFIELD

OF MONTANA

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. MANSFIELD. Mr. Speaker, on September 19, 1951, I inserted in the CONGRESSIONAL RECORD, pages A6001 to A6005, a statement on the proposed Harvey loan, letters to Secretary of the Interior Oscar Chapman and Administrator Stuart Symington of the RFC, requesting an answer to certain allegations made by columnist Drew Pearson in the press and over the radio, letters to the Honorable PORTER HARDY, chairman, Subcommittee on Government Operations, Committee on Expenditures in the Executive Departments, and also to the Honorable J. Howard McGrath, Attorney General of the United States, requesting immediate investigation by the Justice Department and Congress of the charges made.

On September 20 I received an answer from the Honorable Stuart Symington dated September 19 and on the day of receipt of Mr. Symington's letter I addressed the following letter to the Honorable Manly Fleischmann, Administrator, Defense Production Administration, asking for a complete investigation:

SEPTEMBER 20, 1951.

HON. MANLY FLEISCHMANN,
Administrator, Defense Production Administration, Washington, D. C.

DEAR MANLY: I am in receipt of the following letter from the Honorable Stuart Symington, Administrator of the Reconstruction Finance Corporation, dated September 19, 1951:

"HON. MIKE MANSFIELD,
"House of Representatives,
"Washington, D. C.

"DEAR MIKE: Thank you for your good letter of September 17 about Mr. Drew Pearson's allegations concerning the Harvey Machine Co.

"As you understand, the role of the RFC in this matter is merely as fiscal disbursing agent. The loan was originally authorized by DPA on advice from the Interior Department.

"The only information we have is that a few days ago we were instructed by DPA to hold up any further action on this loan until further notice. The reasons for this were not made known to us, and the only thing I can do is to refer you either to Secretary Chapman or Mr. Manly Fleischmann.

"With best personal wishes, I am

"Sincerely,

STUART SYMINGTON"

I have already written to Secretary Chapman and in view of Mr. Symington's letter, I am writing to ask you to conduct a complete investigation of the allegations made by Mr. Pearson. I am enclosing herewith copies of letters I have sent to Secretary Chapman, Mr. Symington, Attorney General McGrath, and Congressman PORTER HARDY on this matter.

Must close now but with best personal wishes, I am

Sincerely yours,

MIKE MANSFIELD.

On September 21, I received a telegram from the Fraternal Order of Eagles, Aerie 234, Kalispell, Mont., and am incorporating it and my reply at this point in the RECORD:

KALISPELL, MONT., September 20, 1951.
HON. MIKE MANSFIELD,

House of Representatives:

The Kalispell area Fraternal Order of Eagles at its regular meeting voted unanimously their desire that you exert all within your power to secure the Harvey aluminum plant for this territory. Also to commend you on your efforts in the past and the present in this vital matter to this territory.

FRATERNAL ORDER OF EAGLES AERIE,
BOB FINLEY, *Secretary*.

SEPTEMBER 21, 1951.

MR. ROBERT FINLEY,
*Secretary, Fraternal Order of Eagles,
Kalispell, Mont.*

DEAR BROTHER FINLEY: This will acknowledge receipt of your letter of September 20 which I was delighted to receive.

I am doing everything in my power to have this matter settled at the earliest possible moment so we can get an industry into Montana. I feel that in view of the allegations raised, that the only alternative at the present time is to have this matter investigated as quickly and as thoroughly as possible, so that the public will know all the facts and we will be able to go ahead with the development of the Flathead.

Must close now but with best personal wishes to you and all my other brothers in Aerie 234, I am

Sincerely yours,

MIKE MANSFIELD.

P. S.—I am sending you a CONGRESSIONAL RECORD which contains my remarks on this matter.

M. M.

On September 24 I received a letter from Mr. Don Treloar, of Kalispell, Mont., enclosing a copy of a telegram signed by S. I. Rapson, chairman, Flathead County Republican Committee, which I am inserting at this point in my remarks:

SEPTEMBER 22, 1951.

Regarding statement of Representative Saylor concerning political implications of Harvey loan, citizens Flathead County appalled to see this matter being turned into political football. Establishment this company in our valley never been political issue here. Republicans, Democrats joined together to encourage Harvey company's aluminum plant as it would provide critically needed winter payroll and bring balance into heretofore purely agricultural economy. In name of justice, we urge you to use the powers of your office to bring about consummation of this loan at earliest possible moment.

S. I. RAPSON,
Chairman, Flathead County Republican Committee.

On September 25 I was notified by the Honorable PORTER HARDY that his subcommittee would begin an immediate investigation of the proposed Harvey loan and also the power shortage in the Pacific Northwest in connection with it.

The official notice, as it appears in the CONGRESSIONAL RECORD, Daily Digest, of September 25, 1951, follows:

ALUMINUM PLANT INVESTIGATION

Committee on Expenditures in the Executive Departments: The Subcommittee on Government Operations announced today

that it will begin immediately an investigation of the proposed Government loan of \$46,000,000 to the Harvey Machine Co., of California, for the construction of an aluminum plant in the Flathead Valley of Montana. The investigation was requested by Representative MANSFIELD in a recent letter to Subcommittee Chairman HARDY. Certain allegations of impropriety on the part of the Harvey Co., in the conduct of World War II business for the Government, have been made by a widely known columnist, also charges of political influence in connection with the proposed loan have been raised by Representative SAYLOR. All facts concerning the loan will be explored by the subcommittee, though it has no advance information whatever regarding the charges which have been publicized.

Another phase of the loan which will receive attention concerns the announcement of last Saturday by Defense Mobilizer Charles E. Wilson that several aluminum companies had been requested to move their plants from the Pacific Northwest by reason of a power shortage in that area. It is known that the new Harvey plant was to receive its power from the Bonneville Power Administration. The subcommittee will seek an explanation of why a certificate of necessity granting tax benefits and a defense loan were approved for a new facility to be constructed in an area where power is reported to be short.

On September 26, I received the following communication from the Honorable Stuart Symington:

RECONSTRUCTION FINANCE CORPORATION,
Washington, September 25, 1951.

HON. MIKE MANSFIELD,
*House of Representatives,
Washington 25, D. C.*

DEAR MIKE: Thanks for my copy of the CONGRESSIONAL RECORD of Wednesday, September 19.

As you undoubtedly know, the RFC had no position in the Harvey loan. At that time the Executive order was not signed and we were merely acting as fiscal agent.

I do hope to see you soon.

Sincerely,

STUART SYMINGTON.

On September 28, I received the following answer from Attorney General McGrath in response to my request for a complete investigation by the Justice Department:

OFFICE OF THE ATTORNEY GENERAL,
Washington, D. C., September 27, 1951.

HON. MIKE MANSFIELD,
*The House of Representatives,
Washington, D. C.*

MY DEAR MR. CONGRESSMAN: This will acknowledge receipt of your letter dated September 19, 1951, relating to the Harvey Machine Co., with which you transmitted a copy of your letter dated September 17, 1951, written by you to Mr. Oscar Chapman, Secretary of the Interior, and a copy of your letter dated September 17, 1951, to Mr. Stuart Symington, Administrator of the Reconstruction Finance Corporation. With your letter also was the extension of remarks of Hon. JOHN P. SAYLOR made in the House of Representatives on September 18, 1951.

Specifically, you refer to allegations made by Mr. Drew Pearson in radio broadcasts and newspaper articles and request that an investigation be made and a public report submitted. For your information, the Department conducted an extensive investigation in 1943 with reference to certain allegations relating to the Harvey Machine Co., upon completion of which it was concluded, based on the investigative reports received by the Department, that there were no viola-

tions of Federal criminal statutes. It is the long-established policy of the Department to decline to divulge information relating to pending cases or those which have been closed by the Department after a determination that prosecution should be declined, and I know that you will appreciate the wisdom of that policy and the reasons for declining your request.

You also request that we investigate and answer the comments of Congressman SAYLOR. It would appear, in our judgment, that those remarks reach areas of controversy into which the Department believes it inappropriate to intrude, and, accordingly, it is regretted that we cannot comply with that request.

We wish you to know that this Department, wherever appropriate, is pleased to make available to the various departments and agencies of the Government such information as will assist them in the performance of their duties. You will appreciate, of course, that this observation is intended in no way as a comment on the bill which you introduced in the Congress to provide that the Department of Justice shall act as a clearing house for the exchange of interdepartmental information.

Sincerely,

J. HOWARD McGRATH,
Attorney General.

Mr. Speaker, this brings up to date all the information I have on an aluminum industry for Montana.

I want to repeat again that I want a permanent industry for the Flathead to relieve the terrific unemployment problem that has plagued the Flathead every winter and which will be accentuated by the completion of the Hungry Horse Dam next year. I also want to repeat that, in accordance with the statute authorizing the Hungry Horse, the power generated there must be used "primarily in the State of Montana" for its development and for the security and future of my people.

Mr. Speaker, I have heard rumors to the effect that there is a possibility that Hungry Horse power may be diverted to the Spokane area to assist aluminum production there. I sincerely hope that this is not true because if that should happen Montana would be left holding the bag. Hungry Horse power belongs to the citizens of Montana and Montana needs the industry this power will generate. I intend to fight for this power to be used in Montana and there will be no compromise of any sort in this battle.

Thatcher Ferry-Highway

EXTENSION OF REMARKS OF

HON. CLARK W. THOMPSON

OF TEXAS

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

MR. THOMPSON of Texas. Mr. Speaker, since the completion and opening of the Panama Canal in 1914 one of the most important projects designed to serve the Canal Zone and the Republic of Panama has been that of the permanent ferry across the Canal, at the Pacific entrance, and the connecting road

running from the ferry's western terminus to connect with the national highway of Panama extending from the western boundary line of the zone northwardly to the Costa Rican boundary.

When the original treaty—1903—between the United States and Panama was negotiated—and which provided for the construction, maintenance, operation, and sanitation of the Panama Canal—no provision was made for the passage of persons and vehicles across the Canal. This may have been due to oversight, or with the idea in mind of hardening that matter separately when the Canal was completed. In any event, after such completion, for many years both the Republic of Panama and the Canal Zone suffered greatly through this lack. Makeshift arrangements for crossings were made; but these were altogether inadequate; and the whole situation proved both disadvantageous and unjust to Panama and its citizens; and the civil and military functions of the Canal Zone greatly suffered.

To correct the conditions thus presented, in the fall of 1929—Seventy-first Congress, first session—Hon. Maurice H. Thatcher, then a Member of Congress from the Louisville, Ky. District, introduced and pressed to enactment a measure—H. R. 4293—entitled "A bill to provide for a ferry and highway near the Pacific entrance of the Panama Canal." The sum of \$1,000,000 was authorized by the bill—and expended thereunder—for the establishment of a permanent ferry across the Canal at or near Balboa, in the Canal Zone, to a suitable point on the opposite side, adequate for the service of all public and military needs; and, for the same purpose, the building of a highway from the western terminus of the ferry to the town of Arraijan, in Panama, on the Canal Zone-Panama line.

Hearings were had on the measure, at which Congressman Thatcher and Col. Harry Burgess, then Governor of the Panama Canal, appeared and explained its provisions and urged enactment. The House Committee on Interstate and Foreign Commerce—at the time charged with jurisdiction of Panama Canal legislative matters—unanimously reported the bill favorably; and its passage by the two Houses followed; and it became a law when approved by President Hoover on May 27, 1930. The pen with which the bill was signed going to Congressman Thatcher, who yet has it in his possession, together with a number of other pens used by Presidents of the United States in signing measures successfully sponsored by him; altogether a unique and interesting collection.

The ferry and highway were officially named in honor of the author of the legislation, Thatcher Ferry and Thatcher Highway.

At first, two ferry vessels were built and operated under the appropriation authorized; and more recently a third vessel was placed in the ferry service, bearing the name of a long-time President of the Panamanian Republic, the *Presidente Parras*. The other two are named, respectively, *President Roosevelt*—Theodore—and *Presidente Amador*, the first President of the Republic.

During the construction period of the Panama Canal Mr. Thatcher served several years as a member of the Isthmian Canal Commission—which had direct supervision of the construction of the Canal—and in charge of the civil affairs of the Canal Zone, as Governor. In these capacities, as well as Representative in Congress, he rendered highly useful, able, and honorable service.

The million dollars authorized by the Thatcher Act was expended for the construction of the necessary slips, ramps, ferry approaches, and vessels; and the building of the indicated highway. Both the latter and the ferry constitute links in the Inter-American Highway, extending through North America to the city of Panama, completed with the exception of a few sections in Mexico and Central America. The ferry and road, under the terms of the act, are toll free, and wholly maintained by our Government.

In passing it might be well also to recall the fact that Governor Thatcher—while in Congress—was the author of the act which provided for the establishment, maintenance, and operation of the Gorras Memorial Laboratory in Panama City, with annual congressional appropriations for such maintenance and operation. The Republic of Panama generously donated the necessary buildings and grounds as the home of the laboratory, which was established following the Executive approval of the act May 27, 1928. The institution is devoted to study and research concerning the cause and prevention of tropical diseases—both human and veterinary—and has come to be regarded as one of the outstanding sanitary science agencies of the tropical world.

As the western half of the Republic of Panama produces most of the agricultural, horticultural, and livestock products of the country, and as the city of Panama, the capital, is situated on the east bank of the Canal, the Thatcher Ferry and Thatcher Highway have physically united the two great segments of the Republic and have served, and are serving, the Government and people of Panama in an indispensable manner. Similarly, the interests of the Panama Canal, the Canal Zone, and our Military Establishment are being served. The traffic thus resulting has been of a very heavy character. In this general connection, I am including as a part of these remarks—the courtesy of extension having been granted me—a very interesting article appearing in the Panama Canal Review of August 3, 1951. The Review is the newly established official publication of the Canal Zone and Panama Canal:

TEN MILLIONTH CAR CROSSES CANAL BY THATCHER FERRY

Some lucky motorist has a grand prize of at least one free round-trip across the canal by Thatcher Ferry awaiting him or her.

The prize is being offered by dredging division officials to identify the ten millionth car transported across the canal since Thatcher Ferry was opened September 1, 1932. The car was the second to be driven aboard the ferryboat *President Roosevelt* on the east-west run at 10:15 o'clock on the morning of June 29.

The monumental milestone in ferry operations caught the dredging division's people

somewhat by surprise. It was not until some days after the ten millionth car used the ferry that the figures were tabulated and it could be identified.

Another big marker in ferry operations is near—the fifty millionth passenger—and Thatcher Ferry checkers will be warned in advance to identify the distinguished passenger.

SERVICE STARTED IN 1923

Ferry service across the canal has been provided on the Pacific side since 1923 when the Army started a tug-and-barge service to supply its posts in the vicinity of Culebra and Empire on the west side of the canal. It operated only between the east and west wing walls of Pedro Miguel Locks.

After the Army posts on the west side of the canal were closed, the ferry operations were transferred to the dredging division. It first used a gasoline-powered tug and a barge. At that time 10 round trips a day were made except on Tuesdays and Thursdays when only four round trips were scheduled. This service was vastly improved about three years later because of increasing traffic to points in the interior. A steam-powered tug replaced the gasoline tug and continuous service was provided from 6 o'clock in the morning until 9 o'clock at night.

A continued increase in vehicular traffic across the canal and the construction of Thatcher Highway, which began in 1930, required additional facilities. Accordingly, two ferryboats, the *President Roosevelt* and *Presidente Amador*, were built by the mechanical division (Industrial Bureau) and were commissioned July 28, 1931, and used for a few months at Pedro Miguel. After the ferry slips were built on opposite sides of the canal at La Boca by the municipal division, the service was transferred from Pedro Miguel to Balboa when Thatcher Highway was opened in September 1932.

INTERIOR TRAFFIC INCREASES

The transfer resulted in a marked increase of traffic to the interior and it soon became necessary to increase the 24-trip service with only one ferryboat in operation on week days, to continuous service with both ferryboats in operation.

With the beginning of the third locks project in 1939 and the huge development of military installations on the west side of the canal during the same period, it became necessary to augment Thatcher Ferry service. This was done by instituting a ferry service across Miraflores Lake. This was started in August 1940 and continued through June 1942 when Miraflores bridge was opened.

Until the prewar construction program was begun, Thatcher Ferry service was ample for the vehicular traffic across the canal. However, during its heyday in the early forties there were usually long lines of cars waiting at each end of the ferry line, especially on holidays and weekends.

TWO BIG FERRYBOATS BOUGHT

In order to provide increased service, two larger Diesel-electric ferryboats which had been in operation between New York and New Jersey were bought by the canal. The first one, the *Governor Moor*, was lost at sea in January 1942 while being towed to the Isthmus. The second, the *Nawau*, arrived safely in November 1942. After considerable repairs and alterations it was renamed the *Presidente Porras* and placed in service in February 1943.

The top year in ferry operations came during the fiscal year 1941 when 992,000 cars and 5,590,000 passengers were ferried across the canal by Thatcher Ferry and 422,000 vehicles and 1,500,000 passengers used Miraflores Ferry.

After Miraflores Bridge was opened to cross-canal traffic in 1942 the ferry business slumped badly. Miraflores Ferry was closed, except for a 3-day period in 1943 when the bridge was out of service, and the number of cars and passengers using Thatcher Ferry

dropped to 480,000 and 3,200,000, respectively, in 1943.

OVER 500,000 CARS ANNUALLY

The business showed a slight increase after that when the novelty of crossing the canal by bridge had worn off and while gasoline rationing was in effect. Since 1943 the traffic over Thatcher Ferry has settled down to a comparatively steady business with 500,000 to 600,000 cars a year and between 2,000,000 and 3,000,000 passengers.

Thatcher Ferry, aside from its astronomical statistics, has made an amazing safety record. Not a single passenger has been injured as a result of ferry operations and the few dented fenders have resulted largely from inept driving.

It has made countless "mercy missions" or emergency trips but it has yet to record a birth aboard one of the ferriboats, a record surpassed several times by the Panama Railroad.

Corruption in the Bureau of Internal Revenue

EXTENSION OF REMARKS OF

HON. LAWRENCE H. SMITH

OF WISCONSIN

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. SMITH of Wisconsin. Mr. Speaker, the public is in revolt because of recent disclosures in the Bureau of Internal Revenue. Twenty years of entrenched government is sufficient to sow the seeds of corruption and the Democratic administration is reaping the fruits of its own political power. The Sunday Star for yesterday calls the turn on this situation and I include it as part of my remarks:

CORRUPTION IN THE CITADEL

The Bureau of Internal Revenue, with all of the power that it exercises over the most intimate financial affairs of the people, should be a stronghold of integrity. To an extent that applies to few other agencies, this branch of the Government should be manned by people who are above and beyond suspicion. This is why the disclosures of widespread corruption within the Bureau have come as such a shock to most people. The adverse effect of the revelations could hardly have been greater if, overnight, it had been revealed that the FBI was staffed by men with sticky palms.

What has reduced the Bureau of Internal Revenue to this low estate? What has happened to the agency which, under the late Elmer Irey, won such wide acclaim as the arch foe of gangsters and grafters, and which locked the prison doors on such unsavory characters as Al Capone and Waxy Gordon?

There can be little argument as to the answer. The Bureau has been corrupted by the intrusion of a brand of politics which makes no adequate distinction between political loyalty and personal integrity. The posts of collectors of internal revenue traditionally have been treated as political plums. But they have not traditionally been handed out on a purely political basis. Merit and personal character have been regarded as essential qualifications.

It is impossible, however, to avoid the inference that merit and character have had scant consideration in some recent appointments. What other conclusion is possible in light of the fact that Internal Revenue officials in Boston, St. Louis, New York, Newark, San Francisco, and Los Angeles have

been fired or have resigned under pressure? One expects to find an occasional bad apple in any barrel. But when there is such extensive rottenness as this, it cannot be explained away on any theory of chance.

In the course of time Federal grand juries no doubt will get to the bottom of the mess, and the officials who have been guilty of actual law violations presumably will be tried and, if convicted, sent to jail. It is a significant—and disturbing—fact, however, that most of the suspensions and resignations have been the result, not of a determined and energetic housecleaning within the bureau, but as a consequence of disclosures by outside agencies, such as the California Crime Commission and the King subcommittee of the House. It is entirely possible that, had it not been for this external prodding, there would still have been no clean-up within the bureau.

The new Revenue Commissioner, John B. Dunlap, seems to be moving energetically to get rid of the shady officials in the bureau. And he says that the President has assured him of "100 percent support" in keeping the bureau "above reproach."

But something more is needed. It is not truly a question of keeping the bureau above reproach, for the bureau has already been seriously discredited. It is necessary, of course, to drive out the grafters and the incompetents. But if the bureau is ever to regain its lost standing, there must be some assurance that one bevy of political hacks and chiselers is not going to be replaced by another equally undesirable group. The Hoover Commission has said that political appointments are "one of the chief handicaps" of the bureau, and a dismissed collector has stated that politicians pressured him into hiring incompetent agents.

If President Truman wants to revive public confidence in this bureau and it is a bureau which must enjoy public confidence if it is to function, he ought to give unqualified assurance that no one will be appointed to office in the bureau simply because he has been a loyal ward heeler or because he has been generous in contributions to ward-heeler politicians.

Why Not a Bounty on Unnecessary Federal Employees?

EXTENSION OF REMARKS OF

HON. PAUL W. SHAFER

OF MICHIGAN

IN THE HOUSE OF REPRESENTATIVES

Monday, September 24, 1951

Mr. SHAFER. Mr. Speaker, farmers have long had the protection of State bounty laws which provide a financial incentive for getting rid of noxious animals or birds of prey that destroy crops or farm animals.

Perhaps this same bounty idea could be applied profitably to the problem of decreasing the swarms of Federal office- and job-holders who today are devouring the Nation's substance. Suppose key supervisory and personnel officials in the multitudinous executive departments, bureaus, agencies and commissions were given a cash incentive to reduce the number of their employees—say \$500 "a head" for every nonessential worker removed from the Federal payroll.

Think it sounds silly? Well, it couldn't possibly be as silly as the existing situation under which these key supervisory and personnel officials actually have a

personal financial incentive to increase the number of their subordinates.

Let me quote a statement which I made in speeches a couple of years ago regarding the Hoover Commission findings:

They (the Hoover Commission task forces) found in many instances personnel supervisors are compensated according to the number of employees they have under them, rather than on the basis of efficiency and economy displayed in their conduct of the work they supervise.

Nothing has happened since the publication of the Hoover report to indicate any change in that basic philosophy and procedure which makes it personally profitable for bigger bureaucrats to create more and more lesser bureaucrats. On the contrary, the swelling Federal payrolls reported by Senator Byrd's Joint Committee on Reduction of Non-Essential Federal Expenditures show that the situation is unchanged. And besides the personal financial incentive affecting the personnel supervisors there is the political incentive for the administration to increase payrolls, based on the Fair Deal theory that each person on the Federal payroll represents four votes for the party.

Here is the latest report by Senator Byrd's committee. The total number of civilian employees in the executive branch of the Government is now past the two and one-half million mark for the first time in 5 years. The civilian payroll for the fiscal year which ended June 30, 1951, totaled \$7,719,076,000, a 17 percent increase over the previous year. Indications are that the payroll this current year will approach, if not exceed, \$10,000,000,000—compared with the World War II peak of \$8,300,000,000.

Of course, there are thousands of necessary, conscientious, and capable Federal employees. But there are also thousands of unnecessary ones, thousands who lack the competence to make good in private employment, thousands who waste hours in department cafeterias and lounges or in needless paper shuffling. And one of the most disturbing features of the situation is the failure of the present Democratic-controlled Congress to approve payroll-reduction amendments to appropriation bills.

Why should not Congress provide a reverse incentive so far as Federal jobs are concerned? I am considering introduction of legislation to pay a \$500 "bounty" to the responsible supervisory or personnel officials for each Federal employee he actually and permanently separates from the Federal payroll; also a provision that any such supervisory employee who added a new and unnecessary employee in his department or agency would himself be fired. The bounty payments could be made from payroll appropriations already voted by Congress.

Even if the \$500 bounty were in the form of an increase in the annual salary of the supervisory officials, the taxpayers would still be far ahead financially. The Byrd committee reports that the average annual salary of Federal employees is approximately \$3,600. Suppose 1,000 employees were removed under this bounty system and that the responsible supervisors received a total of \$500,000 in

bounties. Since the 1,000 discharged employees would represent \$3,800,000 in aggregate annual salaries on the basis of the average, the net saving to the taxpayers would still be \$3,100,000 a year.

Is it not at least as important to protect the national economy from the predatory raids of the tax eaters as it is for the farmer to protect his crops and other property from birds of prey or noxious animals?

One Example of Military Spending That Could Be Curtailed

EXTENSION OF REMARKS OF

HON. HUBERT B. SCUDDER

OF CALIFORNIA

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. SCUDDER. Mr. Speaker, under leave to extend my remarks in the Appendix of the RECORD, I include an editorial from the Petaluma (Calif.) Argus-Courier, under the date of September 22, 1951.

The largest peacetime military appropriations bill in the history of our country—amounting to nearly \$80,000,000—is under consideration by the Congress. None of us doubt the necessity of building up our Armed Forces for national defense—especially in view of the emergency conditions which presently exist. However, I am advised that in excess of \$4,500,000 has been allocated the Armed Forces to conduct advertising campaigns to promote their recruiting programs. Considerable doubt has been expressed as to whether the medias presently used by the services attain necessary and complete coverage.

Also, in view of the fact that our young men are being drafted to meet requirements of the Armed Forces, it would seem that an adequate recruiting program could be conducted with less expense.

The editorial in reference to above, entitled: "Military Spending," is based upon the unnecessary features of such spending. I call it to your attention as not only being very appropriate—but containing sound reasoning on the question of military appropriations. It is as follows:

MILITARY SPENDING

In a time of world tension military spending mounts rapidly. The services expand their civilian arms excessively, military procurement is extravagant, and whatever Congress grants the services never seems to be as much as they need or want. It is difficult for anyone except military experts to know exactly what is needed, and so Congress is disposed to grant the armed services what they seek. And anyone who dares to suggest that too much money is being appropriated is likely to be assailed by some easy spender or demagogue as one who would leave the country wide open to the enemy.

An Associated Press dispatch carries the story of an Army and Air Force plan for an extravagant recruiting program to be carried on this fall and winter. The services would pay \$668,000 to a singer and sports broadcaster for network programs. Several members of the Senate Appropriations Com-

mittee have denounced the plan as excessive and unwarranted, and one has said that he would ask that a ban against the proposed expenditures be written into the military appropriations bill.

Most of the services carry on more or less elaborate recruiting programs. They maintain recruiting stations in many communities throughout the Nation. The personnel who man these stations are chair soldiers, who might well be doing more effective work for the Nation in an essential military field. With a draft program a recruiting program hardly seems necessary. The armed services can obtain all the men they need through the draft.

Here is one example of military waste that can be attacked without fear of being assailed as a Communist sympathizer. We suggest, however, that it is not the only form in which the military services are being extravagant, and that Congress should scrutinize every military spending program as carefully as any nonmilitary spending program. We should get rid of the idea that a military appropriation is untouchable.

The armed services themselves would benefit from any pruning of their budget that can be done without impairing their military effectiveness. For they not only contribute to inflation because of the size of their spending program, but they are also the victims of inflation in that they, too, are caught in the tide of rising prices. The cost of maintaining one soldier has increased tremendously since World War II.

We have placed most of our emphasis on cutting nondefense expenditures, when we should be emphasizing cutting all expenditures.

Prophecy To Be Fulfilled?

EXTENSION OF REMARKS OF

HON. ANGIER L. GOODWIN

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Monday, September 17, 1951

Mr. GOODWIN. Mr. Speaker, I have received from a constituent the following letter dated September 7, 1951:

Hon. ANGIER LOUIS GOODWIN,
House Office Building,
Washington, D. C.

DEAR CONGRESSMAN: I enclose a clipping which recently came to my attention.

I thought it would be of interest to you.

It would appear that the prophecy of Senator Hill of 73 years ago is about to be fulfilled, unless our congressional leaders take prompt steps to correct this condition.

Very sincerely yours,

EDWARD PAGE.

On September 11, 1951, the Wakefield (Mass.) Daily Item, an enterprising newspaper published in my district, printed as an editorial on its first page this prophecy of former Senator Hill. It appears that the subject matter of this 73-year-old speech has aroused widespread interest and so under leave to extend my remarks I am inserting the editorial herewith for the benefit of my colleagues:

PROPHECY TO BE FULFILLED?

(Extract from a speech made by Senator Benjamin Harvey Hill in the United States Senate, March 27, 1878)

But, sir, I have said I do not dread these corporations as instruments of power to destroy this country, because there are a thousand agencies which can regulate, restrain,

and control them; but there is a corporation we may all dread. That corporation is the Federal Government. From the aggression of this corporation there can be no safety. If it is allowed to go beyond the bounds, the well-defined limits of its power. I dread nothing so much as the exercise of ungranted and doubtful powers by this Government. It is, in my opinion, the danger of dangers to the future of this country. Let us be sure we keep it always within its limits.

If this great, ambitious, ever-growing corporation becomes oppressive, who shall check it? If it becomes wayward, who shall trust it? If it becomes unjust, who shall trust it? As sentinels on the country's watchtower, Senators, I beseech you, watch and guard with sleepless dread that corporation which can make all property and rights, all States and people, and all liberty and hope its playthings in an hour and its victims forever.

Recommendations by New Mexico Cattle Growers Association

EXTENSION OF REMARKS OF

HON. ANTONIO M. FERNANDEZ

OF NEW MEXICO

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. FERNANDEZ. Mr. Speaker, by unanimous consent, I include in the RECORD excerpts from the resolutions adopted by the New Mexico cattle Growers Association at their quarterly meeting in Gallup, N. Mex., on September 7 and 8, 1951. This is an association of fine, progressive businessmen engaged in the largest industry in the State of New Mexico, and the resolutions adopted by them after deliberations are of such importance that I felt attention should be called to them for the information of all the Members of Congress and of the departments affected.

The association: First, deplores the loss of over 100,000 acres of forest land through fires, in part accelerated by failure of the Forest Service to permit full utilization of forage and recommends full and complete investigation by the Secretary of Agriculture; second, commends the Department of Agriculture for its new so-called three-step method of evaluating range and forest conditions and recommends fair trial of this new method before putting further grazing limitations into effect; third, recommends against any system of program planning such as that apparently envisioned by the so-called family farm policy review; fourth, recommends that a uniform code of administration for all public grazing lands be enacted before consolidation of such grazing lands in one administration as recommended by the Hoover Commission; and, fifth, recommends enactment of legislation providing compensation for damage incurred to deeded land by the exploration of federally reserved oil and gas minerals therein.

The following are excerpts from the resolutions:

FOREST FIRE DESTRUCTION

Whereas destructive fires in national forests of New Mexico and Arizona have burned over more than a hundred thousand acres

of valuable grazing and timber lands since the first of the year; and

Whereas this loss of forage and timber will be felt for many years in the southwest, and will result in serious soil erosion on vital watershed lands of this region, and

Whereas the tremendous cost to the United States Government in controlling these fires can only lead to requests for increased appropriations for the Forest Service, and

Whereas the livestock industry of this State has repeatedly warned officials of the United States Forest Service that their policy of drastically reducing grazing on forest lands would create a serious and destructive fire hazard, through the growth of waste and uncut grass and forage which serves as a tinder box during the summer fire season, and

Whereas we recognize that an undue fire hazard was caused this year because of drought conditions, but feel it important to point out that the most serious fires occurred where the raising of livestock had been most drastically curtailed: Now, therefore, be it

Resolved, That we ask the Secretary of Agriculture in the interest of conservation and increased meat production to make a full and complete investigation of the serious fire hazards now being created on western ranges of the national forest, with a view toward preventing this continued destruction to our lands and this important natural resource

FOREST SERVICE RESEARCH

Whereas the United States Forest Service in recognition of the fact that their current analysis of forest range conditions and trends have not been accurate, has recently developed a new, so-called three-step method of evaluating range and forage conditions, and

Whereas leading range research men in the Forest Service report that the new system will give a true and correct picture of the relative improvement or deterioration of rangeland conditions, and

Whereas the United States Department of Agriculture is to be commended for recognizing the need for a new and improved scientific method of rangeland analysis, and should also recognize and seek advice and counsel of all classes of land users on a local level while conducting further experimental work of this kind, and

Whereas, acknowledgment on part of high officials of the United States Forest Service, that past and recent methods of evaluating rangeland conditions have been inaccurate. Now, therefore, be it

Resolved, That we hereby petition the Secretary of Agriculture to direct the Chief of the United States Forest Service to cancel future reductions in grazing permits on forest lands until such time as the three-step method can be put into operation and given a fair trial in the field.

FAMILY FARM POLICY REVIEW

Whereas the livestock industry of New Mexico has been and is well served by the extension research and instruction services of our land-grant college and the Federal agencies cooperating therewith; and

Whereas the livestock growers of New Mexico individually and collectively now take an active part in the formulating of research and extension programs which are of mutual benefit to all, and

Whereas we believe that the agricultural interests of this State are best served by extension and research programs developed by the people of New Mexico at the local, county, and State level in cooperation with State and county agricultural specialists cooperating with the United States Department of Agriculture; and

Whereas we see no advantage in a system of program planning which would destroy this State and county relationship such as the family farm policy review, with our ag-

ricultural specialists and which would tend to involve the agricultural people of New Mexico in a system of direct line Federal controls and directions.

We, therefore, register protest against moves already taken, proposed or intimated that would subject the members of this organization to further control and direction by agencies in which we have no representation

We further protest such movements or organization of such Federal agencies which tend to usurp the freedom of the agricultural interests of this State, individually or collectively, in drawing up their own agricultural extension, research, and instruction programs.

REORGANIZATION OF DEPARTMENT OF AGRICULTURE, S. 1149

Whereas Senate bill 1149 has been introduced by Senator Aiken and others for the purpose of putting into effect certain recommendations of the Hoover Commission report applying to the administration of public lands; and

Whereas the New Mexico Cattle Growers Association recognizes the need for economy in the Government and realizes the advantages of combining the various public grazing lands under a single unified administration, and

Whereas a consolidation of the existing varied and confusing methods of administration under one agency would serve only to cause more confusion, uncertainty, and lack of stability in the livestock industry, and

Whereas we have endorsed the suggestions for an act to establish a uniform Federal grazing act, proposed by the stockmen's grazing committee. Now, therefore, be it

Resolved, That the New Mexico Cattle Growers Association urge that a uniform code of administration for all public grazing lands be enacted previous to consolidation of all such grazing lands in one administrative agency as proposed by S. 1149.

COMPENSATION FOR DAMAGE IN EXPLORATION OF RESERVED MINERALS, H. R. 2191

Whereas H. R. 2191 introduced in the House of Representatives by Congressman HARRISON of Wyoming provides for a 3-percent royalty payment to reimburse land owners for surface damage to lands which result from oil operations, these lands having been patented with a reservation of oil and gas to the Federal Government. Now, therefore, be it

Resolved, That we urge and recommend that our Congressmen and Senators from New Mexico work for passage of this legislation.

Treaty With Denmark

EXTENSION OF REMARKS

OF

HON. BEN F. JENSEN

OF IOWA

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. JENSEN. Mr. Speaker, at 10 o'clock this morning, October 1, 1951, the American Ambassador to Denmark, Mrs. Anderson, and Ole Bjorn Kraft, Danish Minister for Foreign Affairs, signed a treaty on behalf of their respective governments. This treaty had to do with commerce, navigation, and mutual friendship.

This is the first such treaty to be entered into with a North Atlantic Pact

country since the signing of the North Atlantic Treaty.

But it is not the first such treaty between United States and Denmark.

One hundred and twenty-five years ago—on April 26, 1826—Henry Clay, as Secretary of State, signed just such a treaty for the United States. It is important to note that, for a century and a quarter, it was not deemed necessary to change one word of that 1826 pact.

One hundred and twenty-five years have brought about a need for commercial and navigation adjustments. Those years have wrought no significant alteration in regard to the mutual friendship between these nations.

The orderliness of thought, the deeply ingrained respect for law, of the Danish people is something which the people of the United States may, today, consider and emulate. We, the people of the United States, can balance that great contribution by continuing our respect for and admiration of the Danish people and their understanding government.

It is my prayer that the treaty which was signed this day by the representatives of the Governments of the United States and Denmark may long endure for the mutual advantage of both nations.

United States Seizes Trio in \$100,000,000 Gold-Smuggling Operations

EXTENSION OF REMARKS

OF

HON. CARROLL D. KEARNS

OF PENNSYLVANIA

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. KEARNS. Mr. Speaker, under unanimous consent, I include in the RECORD an AP story which appeared in the Washington Sunday Star of September 30, 1951, entitled "United States Seizes Trio in \$100,000,000 Gold-Smuggling Operations":

UNITED STATES SEIZES TRIO IN \$100,000,000 GOLD-SMUGGLING OPERATIONS

New York, September 29 —Federal agents have arrested three men who the Government said today are members of a \$100,000,000-a-year gold-smuggling ring menacing the finances of the United States and other countries.

Assistant United States Attorney Louis I. Kaplan said the Government is watching 50 or 60 persons suspected of buying gold at United States prices and selling it abroad at twice what they paid for it.

The three arrested men purchased \$2,000,000 worth of gold for black-market sales in foreign areas, Mr. Kaplan said. The attorney described them as "a small part of a vast smuggling ring."

They were charged with violating the 1917 Trading With the Enemy Act which makes it illegal to hold or earmark gold in amounts exceeding \$100.

"They represent a small phase of a vicious black-market operation," Mr. Kaplan said, "which is dangerous to the finances of the United States and other nations."

The three Brooklyn men arrested yesterday were identified as Emil Popper, 54; Robert J. Carroll, 41, and Samuel Diamant, 55.

United States Commissioner Isaac Platt released Popper and Diamant in \$15,000 bail each, and Carroll in \$10,000 bail.

Mr. Kaplan said the men obtained the gold through filing false statements with the Treasury Department on the use of the gold, supposedly purchased for the legitimate manufacture of jewelry.

He said Popper originated a jewelry manufacturing firm in Brooklyn, Carroll joined with him, and they were awarded a Treasury license approving the daily purchase of 150 ounces of gold.

Mr. Kaplan said none of the gold they purchased was ever used for making jewelry.

SHIPPED OUT OF COUNTRY

Instead, Mr. Kaplan said, they delivered it to Diamant at a profit to them of \$3 an ounce, or \$450 a day.

Diamant would accumulate quantities of the gold, ship it out of the country or resell it to others for shipment, the prosecutor said.

Federal agents said the ring smuggled gold concealed in new automobiles, lubricating oil, suitcases, and chicken fat, sending it to such black markets as Rotterdam, Bombay, Tangiers, and Uruguay.

The investigation of the ring began last winter with the arrest of Saul Chabot, 51, as his car loaded with \$150,000 worth of gold was being put aboard the liner, *Queen Elizabeth*, Mr. Kaplan said.

On June 28 Chabot was sentenced to 5 years in prison. Mr. Kaplan said sentences of 10 years in prison and a \$10,000 fine may be imposed on the three Brooklyn men if they are convicted.

W. Averell Harriman's Statement Regarding Our Wartime Military Relations With Soviet Union Are Misleading

EXTENSION OF REMARKS OF

HON. TIMOTHY P. SHEEHAN

OF ILLINOIS

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. SHEEHAN. Mr. Speaker, in the CONGRESSIONAL RECORD of August 27, 1951, W. Averell Harriman, Special Assistant to the President, published a statement regarding our wartime relations with the Soviet Union. In reading this statement it seems to me that the only logical interpretation of various statements made by Mr. Harriman would be that there was close military cooperation between the Soviet Union and the United States during World War II.

From the evidence of other competent people this was not the case. Therefore, I have written the following letter to Mr. Harriman:

HOUSE OF REPRESENTATIVES,

Washington, D. C., September 27, 1951.

HON. W. AVERELL HARRIMAN,

Special Assistant to the President,
Executive Office of the White House,
Washington, D. C.

MY DEAR MR. HARRIMAN: With reference to your statement released August 17, 1951, and notarized July 13, 1951, regarding our wartime relations with the Soviet Union, I am wondering whether you would care to give me your comments on my observations as they concern some of your statements.

In this statement you say:

"The primary objective of the American and British Governments in our relations with the Soviet Union during the war was to keep the Soviet Army as an effective fighting force against Hitler. We sought to do this through the shipment of essential supplies and through the coordination of our military strategy. . . . The principal strategic talks took place when Churchill visited Moscow in August 1942 and at Tehran in November 1943. At this latter conference, Stalin was informed of our plans to land in France, and he undertook to attack shortly after we got ashore in order to prevent the Germans from diverting divisions from the eastern front to the west."

A'so:

"In accordance with Stalin's agreement at Tehran, the Russian armies launched a major offensive on June 22 and tied down and broke through this formidable Nazi force."

"These tremendous and courageous operations by the Soviet Army and the fact that Stalin had honored such a vital military commitment influenced the attitude of British and American representatives in subsequent negotiations with the Soviet Union—and built up favorable opinion for the Soviet Union among the people of the United States and other western allies."

Also, in speaking of your raising the subject with Stalin as early as 1942, you state:

"Shortly thereafter we established exchange of combat intelligence."

Also:

"Concurrently with our negotiations for the conduct of the war, President Roosevelt sought to come to an understanding regarding postwar problems with the Soviet Union."

And:

"At Tehran, in addition to the military matters . . ."

It would seem to me that any reasonable persons would interpret the various quotations from your statement, as set forth above, to mean that there was close military cooperation between the United States forces and the Soviet Union during most of World War II.

From this standpoint, I think that you are misleading the American public the same way they were misled all during the war when our people were told or were given the implication by the administration that our military forces and the Russian military forces were working in close cooperation.

In support of the above opinion, I would like to quote you from the report of General of the Army Dwight Eisenhower in his "Report by the Supreme Commander to the Combined Chiefs of Staff on the Operations in Europe of the Allied Expeditionary Force, June 6, 1944, to May 8, 1945," where on page 83, General Eisenhower states:

"Now that the time was approaching for what, we trusted, would be the final blow to Nazi Germany, a closer coordination with the Russian High Command and mutual understanding of our respective plans became essential. Our first liaison with Moscow had been effected late in 1944 when air operations necessitated the establishment of a coordinated bomb line, but little further had been accomplished. The only link between my headquarters and that of Marshal Stalin was through the medium of the Allied Military Mission in Moscow, and it appeared most difficult to learn of Soviet intentions. [Up to the end of 1944 I had received no information on matters affecting the Russian grand strategy. Although I had expressed my willingness to afford any such information concerning my own over-all plans as the Red army might desire.] At Christmas time, however, following upon a message which I sent to the Combined Chiefs of Staff explaining the difficulty with which I was faced in attempting to evolve plans while still igno-

rant of the Russian intentions, President Roosevelt secured from Marshal Stalin his agreement to receive our representative in order to discuss the correlation of our respective efforts in the forthcoming spring.

"Accordingly, in January, my deputy, Air Chief Marshal Tedder, accompanied by Major General Bull (G 3) and Brigadier General Betts (G-2), journeyed to Moscow for this purpose. The conference proved conspicuously successful. In the course of a discussion ranging over many aspects of the forthcoming campaigns, Marshal Stalin was acquainted with the nature of our own plans, including the timing. He, in turn responded with a full explanation of the great four-pronged offensive, involving from 150 to 160 divisions, which the Red army was preparing to launch. I further gave us an assurance that, in the event of the main offensive being halted by bad weather, the Red army would still conduct local operations, which he believed would so pin down the German armies as to permit no major movement of divisions from east to west during the difficult period of the spring thaw. As events showed, the success of this gigantic offensive proved even greater than had been anticipated. In the meantime, fortified by Marshal Stalin's assurances, we were able to proceed with our own operational plans."

You will note I have enclosed in brackets the most significant sentence there, showing that General Eisenhower had received no information up to the end of 1944 affecting Russian grand strategy. Also, General Eisenhower states that at the end of 1944 he was still ignorant of the Russian intentions.

General Eisenhower's thoughts on military cooperation seem to be at great variance with your opinions.

I would also like to quote you from the book by Capt. Harry Butcher, entitled "My 3 Years With Eisenhower," wherein on page 714, under date of December 5, 1944, Captain Butcher says:

"One thing that was bothering him (Ike) was that although a great deal depends upon the date and scale of the anticipated winter offensive of the Russians, actually he knows nothing definite of their plans."

And, on page 735, under date of December 25, 1944, Captain Butcher says:

"General Ike's most cheering present was the knowledge coming from General Marshall that the President had sent a message to Stalin of the Supreme Commander's desire to send a qualified staff officer to Moscow to exchange information essential to our mutual efforts."

And, on page 753, under date of January 29, 1945, and only 3 months before peace was declared, Captain Butcher says:

"At last a direct contact has been made with Stalin so that the two great forces closing in on Hitler can act with proper intelligence."

I would also like to refer you to a statement made by Ambassador Warren R. Austin, on November 14, 1949, shown on page 945 of the book entitled "A Decade of American Foreign Policy, Basic Documents, 1941-49," wherein Ambassador Austin said:

"During the war we sent a military mission to Moscow to transmit military and technological information to the Soviet forces. That service continued throughout the war despite a complete lack of reciprocal treatment from the Soviet Union."

It would seem to me that, on the basis of the above statements which completely contradict any notion of anything resembling close cooperation between our military forces and the Soviet military forces, your statement should be clarified so that the American people are not misled.

Very truly yours,

TIMOTHY P. SHEEHAN,
Congressman, Eleventh District, Illinois.

News Censorship

EXTENSION OF REMARKS
OF

HON. A. L. MILLER

OF NEBRASKA

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. MILLER of Nebraska. Mr. Speaker, the new secrecy order promulgated by the President extending to all Government agencies the authority to classify information and refuse to reveal what they consider to be a threat to security, opens a wide avenue to the destruction of the freedom of the press, one of our fundamental rights guaranteed by the Constitution. The ease with which it can be interpreted by officials to permit suppression of information that might endanger their own security or that of the administration in power has been amply illustrated by past performances of the present and immediate past administrations.

Who is so blind that he cannot see what will happen if this order is permitted to stand? Have we forgotten the deliberate suppression of information regarding the commitments made at Yalta, Telurran, and Potsdam; the delivery of China to the Reds, now being revealed by the McCarran committee after it is too late; the road blocks thrown in the way of the Committee on Un-American Activities in its attempt to blast subversives from executive departments? There is no question in my mind, but that future news will be doctored or treated to meet the wishes of the administration. The iron curtain will be pulled down so there will be a complete blackout of any news which might be unfavorable to the administration. It will permit the administration to sweep its political dirt under the carpet. What a God-send this would have been to former officials of RFC. How convenient it could be to Charlie Brannan, Oscar Ewing, and others to cover up their use of taxpayers' money to promote their Fair Deal socialistic schemes. Who could fashion a better tool for use in shutting off the disclosures now being made which might prove harmful in the coming election?

The natural results of the secrecy order will be that of making it impossible for the citizens to have the right to criticize their Government. It seems to me that bureaucrats are becoming more and more sensitive and are unable to tolerate criticism. There are some things that the executive department, as well as the Members of Congress, should not, in the interest of national security, make known. However, the Presidential order could be interpreted and used by the sensitive bureaucrat to cover up political dirt and wrongdoings in his department.

Mr. Speaker, it has become more and more the order of the day for the Government to feed out propaganda to the favored few newscasters and political writers and sharply criticize those who disagree with the policies of Government. This political smear and propaganda technique plus reprisals does have its

effect upon some timid souls. I hope the free press of the country will show this order up for what it is. It ought to be rescinded.

A Moral Code for Congressmen of the
United States of America

EXTENSION OF REMARKS

OF

HON. JAMES S. GOLDEN

OF KENTUCKY

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. GOLDEN Mr. Speaker, this country was founded by a group of people who loved and wanted liberty. The main foundation was built upon the idea that the people themselves must retain all power to govern themselves. They were breaking away from the oppressive European system that had for centuries delegated all power to kings and dictators, and they had conceived the great hope of mankind, that the individual citizen was the important factor, and that these individuals should govern themselves and be a free people.

With great courage and with this divine inspiration toward a new ideal, they came to a new continent and founded our Government.

It was these seeds of thought and the deep-seated desire in the hearts of these men that finally found fruit and culminated in the adoption of our Constitution and the Declaration of Independence. In the history of the human family, and excepting only the Holy Bible, the above two documents represent the most sacred proclamation ever devised by man.

In this new kind of government, when a republic was established in America, of all of the offices created by our Constitution the office of Congressman was intended to be the closest to the people and it was this divine conception that gave birth to a free and a new Nation. It was the purpose and the very foundation of this new type of government that these representatives of the people, the Congressmen, who must be elected from the people and by the people each 2 years, should in truth and in fact be the voice and the guiding spirit of the people.

Under this new republic, and by the provisions of the Constitution, the Congress of the United States was given inherent power to write all public laws of a national scope and these laws written by the Congress govern and must be obeyed by the President of the United States, all executive departments, the judges of the courts, and by every individual citizen. They gave to the Congress of the United States the power to enact laws, prescribing the exact duties of all Federal officials; the power to levy taxes, to declare war; to amend and enact new laws, making the entire conduct of this Government subject to the will of the Congress of the United States, which was in turn the voice of the people themselves.

Under this system, through the Congress which had these vast powers, and

as the Congress was next to the people and the voice of the people, the people therefore retained, in fact, the power of government over the President, over the executive departments of the Government, and over the courts of the United States.

The provisions in our Federal Constitution gave the Congress the power to levy taxes, to make appropriations for the payment of all salaries of all Federal officeholders and the power to prescribe the duties and limitation of all other Federal offices. It is clear that by retaining these vast powers in the Congress it was intended and it is a fact that the people who elect and control the Members of Congress, do retain all these powers to themselves.

Considering the size of our Federal Government, the wealth and natural resources of this country and its position of leadership in the world, with these vast powers over all branches of the Government reposing in the Congress of the United States, we can begin to grasp the importance of the office of Congressman under our system of government.

To be a Member of the Congress of the United States, with this vast power and with unlimited opportunities for service to the people that contribute so much to the life, liberty, and happiness of our people, we can begin to get some idea of the importance which should attach to a high code of honor and moral conduct that should govern each individual Member of Congress.

Along with these powers and opportunities for service which the Constitution gives to a Congressman goes the tremendous responsibility that should rest upon each individual Member.

Any man who occupies this exalted position should at all times be conscious of and fully realize that he has an opportunity to uphold the traditions of a free nation and a free people in a system of government that has proven itself to be the best ever designed by man.

The Congress of the United States has more power for good or evil than any institution in the history of the world.

When a Congressman acts or speaks, he should realize that he speaks for and represents, not himself, but for, in fact, approximately 400,000 people, and that when the Congress as a whole enacts a new law, it is speaking and acting for more than 150,000,000 people who have put their trust and confidence and faith in the elected Members of Congress.

The things we do here in the Capital of the United States as a Congress, form the pattern for the Christian and freedom-loving people, not only throughout the United States but throughout the world.

Therefore, each Member of Congress must continuously work to make himself better and wiser and a more courageous man. He must search for the deep, underlying moral fiber of justice, honor, and righteousness that runs through all national issues. He must at all times forget himself, and say to himself, "I represent a free and a Christian people, that would not have me use my sacred trust for any small or evil purpose. I should work hard and inform myself in order that I may be led by the hand of

enlightenment and wisdom rather than stagger down the dark and unknown paths of ignorance. I must at all times be guided by the deep desire of a good people, who put their trust in God and seek His divine will."

The spotlight of public opinion is upon the official conduct of each Member of Congress. This is as it should be and they should never conduct themselves so as to be guilty of any sordid or corrupt act which, if done, would be a shock to the American people. These leaders placed in positions of power by the people should set an example to all other Federal officeholders and to the people themselves.

A Member of Congress should at all times be sober and discreet and moderate in his acts and speech, in representing a sane and free people. Before he speaks he should have something good and wholesome to contribute to his colleagues.

Since coming to Congress I have had the rare opportunity of becoming acquainted with other Members from every section of the Nation. I can truthfully state, and it should be known by the American people, that these men are almost universally men of high moral character, with a sincere desire to uphold the best principles of this American Government of ours, that they are devoted to the principles of honor and justice, and many of them have through long years of service acquired knowledge that makes them specialists in the art of national legislation.

A resolution has been introduced in Congress by our colleague, Mr. BENNETT of Florida, being House Concurrent Resolution 128, that sets forth a code of ethics that should be adhered to by all Government officeholders and employees, including Members of Congress, and this resolution has been referred to a committee of Congress, of which I am a member. This resolution is as follows:

1. Government employee should—
1. Put loyalty to God and country above loyalty to persons, party, or Government department.
2. Uphold the Constitution, laws, and legal regulations of the United States and of all Governments therein and never be a party to their evasion.
3. Give a full day's labor for a full day's pay.
4. Seek to find and employ more efficient and economical ways of getting tasks accomplished.
5. Never discriminate unfairly by the dispensing of special favors or privileges to anyone, whether for remuneration or not, and never accept favors or benefits from persons doing business with the Government.
6. Make no private promises of any kind binding upon the duties of office. (A Government employee has no private word which can be binding on public duty.)
7. Engage in no business with the Government either directly or indirectly.
8. Never use any information coming to him in public functions as a means for making private profit.
9. Expose corruption wherever discovered.
10. Never seek to influence another to violate these principles.

It is my opinion that we should give favorable consideration to this resolution, with certain amendments and additions which we can write into this code

of ethics in our committee, and when adopted, I believe that it will be a wholesome thing for Members of Congress, for all Federal officeholders and employees of the Government, and to adopt these resolutions will make a notable contribution to the public services which we all seek to render.

Of course, any moral code cannot be all-inclusive, and each Member of Congress in many instances will have to be guided by an enlightened conscience, yet it is definitely a step in the right direction. It will help us to establish a clean and pure Government, and when this resolution is brought before the Congress of the United States, I recommend its adoption.

If we Members of Congress are truly worthy of moral leadership, this will spread to all other public officials that run this Government; it will inspire our people with the noble purpose and design of this Nation.

It is necessary that the United States not only be the most powerful Nation in the world, it is just as necessary that our moral conduct and high ideals make us worthy of the leadership of an enlightened and Christian world.

During the past 6 years since the close of World War II a crisis has descended upon this country. Within the next 3 or 4 years, in my opinion, events will occur that will determine the outcome of this crisis in the Nation and throughout the world. This period in our national history will determine whether this Nation can endure as a free, Christian Nation, or whether we and the rest of the world will be ground down by the heel of cruel dictators and lose the blessings of justice, and freedom for all mankind.

We in Congress have a large part in laying the plans and directing the course of events that will determine these issues.

New weapons of destruction have been developed that are hundreds of times more powerful than anything heretofore known. The forces for evil and the forces for good are battling over the face of the earth for the possession of the minds and souls of man. Our enemies have possession of some of these destructive weapons; we have many more of them. All good men everywhere are striving to maintain the peace of the world.

Ruthless dictators may plunge us into another war. We must have supremacy in the air, on the sea and in all branches of our Armed Forces, in order to protect these divine principles of freedom, justice and Christianity.

On the other hand, this is a moral struggle that is engulfing the world, and if we win and if righteousness, justice and freedom prevail, we who are the leaders in this Government and who guide our Nation's destiny, must recognize that we ourselves here in Congress must be worthy and must justify ourselves for such moral leadership.

Once during the Civil War a man said to President Lincoln, "Our forces will win because the Lord is on our side," and Lincoln replied, "What I am concerned about is, 'Are we on the side of the Lord?'"

Constitution Being Undermined From Right and Left

EXTENSION OF REMARKS

OF

HON. LAWRENCE H. SMITH

OF WISCONSIN

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. SMITH of Wisconsin. Mr. Speaker, as part of my remarks, I am including a challenging article by John S. Knight, editor of the Chicago Daily News, on the subject of our Constitution. Mr. Knight charges that the Constitution is being undermined by those on both right and left. I commend it to the attention of the House.

UNDERMINING OF CONSTITUTION IMPERILS LIBERTY

Monday, September 17, is the one hundred and sixty-fourth anniversary of the ratification of our Constitution.

There will be widespread observance of the event throughout the country, with churches, schools, and patriotic organizations staging programs designed to focus attention upon the importance of the Constitution to the individual citizen.

The Constitution is your and my guaranty that we cannot be deprived of our individual liberties without due process of law; that we can express ourselves freely without fear of prosecution, that we have certain inalienable rights which no budding local, State, or national dictator can strip away at his whim.

The Constitution is a moving, human document. Fifty years before latter-day reformers advocated antiprejudice laws the Constitution was amended to forbid discrimination because of race or color.

The wise men who wrote the Constitution sought to avoid the injustices of European tyranny and thus brought into being a system of checks and balances as between the executive, legislative, and judicial branches of our Government.

They believed that such a form of government would best protect the individual against lust for power and legislative hysteria.

As Donald Richberg wrote recently in the Freeman.

"The founders of our Republic were so fearful that the tyranny of a majority would eventually destroy our liberties that they prohibited the Government itself from making any laws that would limit free speech, a free press, freedom of religion, or freedom of association, or would deny anyone time-honored protections, such as trial by jury or would deprive anyone of essential enjoyments of life, liberty, or property."

From the start, there was much scoffing at the Constitution. The Tories, both in England and the United States, freely predicted that it would never work.

As late as May 23, 1857, Lord Macaulay wrote to an American:

"Your Constitution is all sail and no anchor. . . . I have long been convinced that institutions purely democratic must, soon or later, destroy liberty, or civilization, or both. . . . Either some Caesar or Napoleon will seize the reins of government with a strong hand; or your Republic will be plundered and laid waste by barbarians in the twentieth century as the Roman Empire was in the fifth; with this difference; that the Huns and Vandals who ravaged the Roman Empire, came from without, and that your Huns and Vandals will have been engendered within your own country by your own institutions."

The British thought the United States could not survive the War of 1812; later they expected the Union to be torn apart and destroyed by the Civil War.

Happily, these dire forebodings did not materialize. The rulers of England underestimated the vitality of our young Republic in 1812 just as they misjudged the character and magnificent courage of the immortal Lincoln in 1861.

The Constitution has served us well, withstood many assaults and still remains the keystone to our arch of freedom.

BOTH RIGHT AND LEFT ATTACK OUR BASIC LAW

But let us not minimize the dangers which still beset us.

From the very advent of the New Deal, the Constitution was under attack from both the right and the left. The "thought control" intellectuals considered it outmoded and inadequate to meet changing conditions, the late Gen. Hugh Johnson brushed it aside when the National Recovery Act was rammed through a bewildered and compliant Congress.

Roosevelt tried to pack the Supreme Court by adding men who shared his beliefs and philosophies. Although this device failed, he was later to gain his objective through deaths and resignations from the Court.

Finley Peter Dunne said many years ago that the Supreme Court follows the election returns. This was never so true as when the New Deal was in full flower.

In the Roosevelt era, the American people became conditioned to government by edict, to accepting bureaucratic rulings rather than court decisions; to trusting the personal diplomacy of Roosevelt beyond constitutional limitations.

In his memoirs, Winston Churchill says that he, and not Roosevelt, drafted the Atlantic Charter. "I am glad it should be of record," says Churchill, "that the substance and spirit of what came to be called the Atlantic Charter was in its first draft a British production cast in my own words."

Churchill then tells of prevailing upon Mr. Roosevelt to make "commitments" that no American President had the right to undertake. He goes on to say "The fact alone of the United States, still technically neutral, joining with a belligerent power in making such a declaration was astonishing."

To quote Felix Morley: "It certainly was." On January 11, 1944, President Roosevelt told Congress that agreements reached at both Cairo and Tehran would be submitted to the Senate, adding that he was "thoroughly conversant with the provision of our Constitution." He said also that "there were no secret treaties or political or financial commitments."

The Yalta deal which gave Russia certain "preeminent" rights in Mongolia and Manchuria without China's knowledge was mentioned in Roosevelt's last message to Congress on March 1, 1945.

"I am aware," said Roosevelt, "of the constitutional fact" that political arrangements made at Yalta "must be approved by two-thirds of the Senate."

But, as Felix Morley says: "This scrapping of the open-door policy has never been approved by, or even submitted to, the Senate."

Thus was the Constitution circumvented.

RIGHT TO HOLD JOB NOW BEING QUALIFIED

Another constitutional protection that has largely disappeared is the famous "right to work" principle.

With widespread acceptance of what Donald Richberg calls the union closed shop, in many cases the right to earn a living is conditioned, as Richberg says, "by paying dues to a private organization and becoming practically, if not legally, subject to its laws and discipline."

"If a worker voluntarily joins and remains in a union, this is 'government by consent

of the governed.' But if he is forced to join, and forced to stay in, this is government without consent, which the Declaration of Independence denounces as tyranny."

Richberg makes the point that those who advocate the union closed shop argue very earnestly and sincerely that the rule of the majority is the American way—and the democratic way—which makes it possible for men to live and work together effectively and peaceably.

He concedes this is partly true but points out that in our democratic American way of life there are also rights of minorities and of individuals which must be maintained and which a majority is not permitted to deny and destroy.

"Is the right to work," Richberg asks, "without being compelled to join a union, one of those democratic rights?"

Actually, there is no democracy in a situation where the right to work depends upon compulsory union membership, where one cannot withdraw without sacrificing his job.

Yet few people seem concerned over the extension of this arbitrary power, nor is there any agitation to make it unlawful to compel an American citizen to join a union in order to earn a living.

Thus, the Constitution is being conveniently ignored.

U. N. TREATIES COULD LIMIT UNITED STATES FREEDOM

A third major threat to constitutional government is legislation by treaty.

How many people know that a United Nations treaty, ratified by the Senate and signed by the President, automatically becomes the law of our land?

For instance, the U. N. Declaration on Freedom of Information and the Covenant on Human Rights contain provisions which could abolish some of our basic freedoms.

One of the U. N. conventions would restrict freedom of the press in the United States, making our own constitutional guarantees meaningless and of no effect.

This condition is at variance with that in most other countries, which reserve the right, even after a treaty has been signed, to determine to what extent, if at all, they intend to implement its provisions.

Frank Holman, former president of the American Bar Association, is making a vigorous fight to safeguard our system of representative government against the dangers of legislation by treaty.

He said recently that "article 6 of the Constitution provides that a treaty when ratified becomes the supreme law of the land, anything in the Constitution or laws of any State to the contrary notwithstanding."

But, he adds, "the traditional American theory of government was and is that our basic rights are retained by the American people even as against government itself, and are not subject to change or modification unless the Constitution be changed by the people themselves."

His theory is that "since the people expressly reserved these 'retained rights' and did not grant their control to any agency of government, our governing officials have no constitutional power to take them away or modify them, whether by treaties or otherwise."

This is interesting doctrine, but the fact remains that these "rights" can be taken away by the simple method of ratifying a U. N. treaty which is not binding upon other nations in the same sense that it is upon the United States.

The subject of "legislation by treaty" or "government by treaty" is extremely complicated but in effect it simply means this:

The well-meaning proponents of the Covenant on Human Rights or the Convention on Genocide would have the United States ratify treaties which, if enforced, would give the United Nations authority over our national, State, and local governments but, as

George Sokolsky points out, "not to give it similar authority over the administrations of other countries."

Thus, the Constitution can be circumvented if the United States Senate and the President proceed to ratify and sign U. N. treaties now under discussion.

LIBERTY MORE IMPORTANT THAN ONE-WORLD SCHEMES

In this country, it has become the fashion to celebrate United Nations Day and make fine speeches about the accomplishments of an organization for which there was both an idealistic and a practical need.

Without saying that the U. N. has been a failure in every field, even its most staunch supporters must concede that it has fallen far short of its most important task—that of preserving world peace.

The dangers inherent in government by treaty as proposed under U. N. procedure should cause every thoughtful and patriotic American to reread and reread the Constitution of the United States so that he may be sure in his own mind that in striving for a world ideal, we are not yielding some of our previous liberties to a supergovernment shaped in an Old World design.

The Constitution was written by men who understood better than we the price of liberty and the blessings of free institutions.

Let's not scrap it for something that may destroy our heritage.

JOHN S. KNIGHT.

Well Done Not Enough

EXTENSION OF REMARKS OF

HON. EDITH NOURSE ROGERS

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mrs. ROGERS of Massachusetts. Mr. Speaker, under leave to extend my remarks in the Record, I include the following editorial from the current issue of the National Tribune, the newspaper of veterans of all wars. This timely editorial discusses frankly and fairly the action of Congress in passing H. R. 3193 over the President's veto.

So much misinformation and misunderstanding of the provisions of the measure have been broadcast to the public that I commend the editorial to your careful reading and study.

The opposition to this measure by the press of the country, with an obvious intent to confuse the public as to the real benefits accruing to those veterans who are so wholly incapacitated as to need the aid and attendance of another person is indicative of the prevailing opposition to any and all benefits relating to veterans and their dependents.

I appeal to all of you who have the disabled veterans' interests at heart to fight against this lethargy and callousness toward the men who have fought our wars. We must not forget their sacrifices for us.

The editorial follows:

WELL DONE NOT ENOUGH

Last week the Senate of the United States put the finishing touch on President Truman's veto of H. R. 3193, a bill that will now provide a pension of \$120 monthly for veterans, principally of the world wars, who require regularly the constant aid of

an attendant—men who are blind and bedridden or so nearly so that they have no means of earning a livelihood. The vote was 49 to 9 and was a heartening affirmation of a similar vote in the House of Representatives on August 17 when the body overrode the objections of the Chief Executive by 318 to 45.

A month ago we detailed here the editorial discussion of the House action by the public press and by editors of news magazines which was practically unanimous in its disapproval of the thinking of the House membership. It is indicative of either ignorance or of vehement opposition to any benefits relating to veterans and their dependents that the same sort of caustic criticism has followed Senate approval of the measure. Without exception the news vehicles of the Nation have commended the President for his courage in disapproving the legislation, they have applied to it various nasty connotations such as "pension grabs" and have taken to task those Congressmen who so believed in the necessity for the bill that they overwhelmingly enacted it into law.

Whenever this sort of thing happens, we suffer from mixed emotions. We recognize that our country attained its present stature among nations because of its independence and for the reason that debate on differing opinion has in large measure developed the path we have traveled to greatness. There can be no doubt that each of us has a right to think independently and to reach individual conclusions, and yet, because elected representatives in the Congress are chosen by the people to voice their sentiments, we sometimes wonder whether or not those who vote one way or another on public policy do not at times misrepresent those who send them to Washington. Certainly it is obvious that no Congressman can become fully informed about every matter he must pass upon when the rolls are called, and so most of them depend upon the reports to the floor from committees specially set up to make a study of particular questions and they cast their votes in accord with what seem to be proper recommendations. Therefore, when some Members of the House and Senate very consistently oppose committee suggestions on matters having no relation to party politics—and the question of veterans' benefits has yet to fall within that category—we are wont to believe that nonconformist voting is controlled alone by prejudice.

Under those conditions, it becomes a task indeed to decide not to make a blacklist of opponents of those rights of the veteran class which historic policy and expert testimony dictate must become a part of the law of the land. There can be no question but that the reactions of news writers are shared by some Members of the Congress or votes would be unanimous, and yet we find invariably that decisions on so-called veterans' legislation cross party lines. We find likewise that opinions differ among men who have themselves served their country in uniform. Admitting that we also entertain some prejudices, we take an open-minded look at the objectors' arguments, perhaps get a little hot under the collar and then attempt to examine objectively the votes of the minority even while entertaining some degree of satisfaction that our own ideas have been sustained overwhelmingly and and that those of our comrades who require assistance have won the day.

It is significant, we think, that of the 45 who voted in the House to sustain Mr. Truman's veto of H. R. 3193, 21 were war veterans and that 4 of 9 similar votes in the Senate were likewise cast by former servicemen. These constituted more than 46 percent of the entire opposition and lead to the justified conclusion that the complaints of news commentators that the Congress is

the victim of a vicious and highly organized veteran lobby is a lot of hokum. Substance is given to that claim when one considers that far less than 20 percent of all veterans are associated with any organized movement among men who at some time or another went to war. Therefore, we say that all of this great praise of the President for his courage and outrageous castigation of Congressmen for their lack of it is pure propaganda bunk manufactured in the diseased minds of people who oppose everything for which organized veterans strive.

Then, we feel it wise to examine a little further into the opposition vote. In this instance we can pass up the nonvoters for a variety of reasons, and we find that the non-veteran opponents are mostly motivated by political expediency, by mere constitutional objections to veterans' legislation of any description and by that overworked motive of economy that they practice invariably at the expense of veterans while being ever willing to help all of the other poor in the world. But among the 25 war veterans in both Houses we must look for other reasons. Some, but not by any means all, had rugged war service yet they were born with silver spoons in their mouths or they have attained such success in life that they have not had to rub elbows with the unfortunate, and they permit themselves to be influenced by their own good fortune. There are also those who adhere stanchly to the wishes of their party leaders for partisan reasons. Some never did see any real service in uniform, while still others grew up in the propaganda age of radical social change and, having reached substantial security themselves, are thoroughly in sympathy with that other idea so generally depicted in the press which contends that no veteran not crippled in action has more call upon the public generosity than the rest of the unfortunate and underprivileged.

In our effort to be charitable, we have not and we probably shall not at this time attempt to place our finger upon the dissident few and try to make examples of them by preparing a blacklist, but at the same time we warn our veterans to study closely the voting records we have printed. Those who failed to cast a ballot to override this and other Presidential vetoes are not the best friends that our veterans have ever had, and they must be considered potential enemies of their cause. Under conditions as they exist today when billions are being appropriated to build up new armies from our youth, as we prepare to enlarge materially all of our armed services at almost untold expense, it is not only the height of folly to treat disgracefully with those who have borne arms in the past and who now need a helping hand from their Government but it is also extremely wise to demonstrate to future cannon fodder and to their families that it is the firm intention of our people to treat kindly and sympathetically with the human wreckage of war. Nothing can be more inconsistent than to demand that young men and women come to the defense of the Nation in time of peril and at the same time try to economize at the expense of those who have become dependent upon the public generosity in part, at least, for the very reason that they made great sacrifices when the country was endangered in another period of stress. All of this talk about leveling things off and resorting alone to social-welfare benefits for non-service-connected veterans and their dependents for the reason that "soon almost every young man may be a veteran" or because "everybody gives in the same measure in total war" is a lot of poppycock. It is demonstrably false and it is antiveteran nonsense.

We do not now condemn without giving them an opportunity to explain those who

have voted against veterans, but we think that more courage in opposing the recent veto was shown by those Congressmen who had the greater understanding and followed the yardstick of precedent that has paid dividends. It is not easy to disagree with a party leader when politics are involved, but high principle is what won in this instance, and those who stood by our needy veterans have helped to perpetuate a system which recognizes that there is a vast difference between public service in uniform and out in times of emergency and that the care of veterans and their families in adversity is as much a part of the cost of wars as is the expense of all others of the weapons required to win them. "Well done" is not enough in the way of reward when they have reached the time of greater need.

Coals to Newcastle

EXTENSION OF REMARKS

OF

HON. LAWRENCE H. SMITH

OF WISCONSIN

IN THE HOUSE OF REPRESENTATIVES

Wednesday, September 26, 1951

Mr. SMITH of Wisconsin. Mr. Speaker, once again the American taxpayer is about to pay a 25,000,000-ton coal bill for V^e tern European countries. It is certainly carrying coals to Newcastle when we ship it from this country to Europe where adequate coal supplies are available. When will the present administration give the American taxpayer some relief from this diabolical situation:

COALS TO NEWCASTLE

According to the estimates of the Economic Commission for Europe, the 1951 shortage of coal for Western Europe will run to about 40,000,000 tons. In the immediate future this deficit can only be filled by exports from the United States. Coal shipments are expected to attain a figure of 25,000,000 tons—the highest amount in history with the exception of the first postwar year of 1946—and, even so, there will be an outstanding shortage of 15,000,000 tons.

This is the kind of situation that makes for the so-called dollar gap. This phrase is much more understandable when rendered underproductivity. There is enough coal underground in Europe to fill Europe's requirements. The trouble involved in getting it out lies with the inefficiency of the operation. European figures for tons per man-hour are far below the American figure. In addition to wider use of machines, the need in Europe is for an increase in the allocation of manpower to the mines. In Britain there has been an over-all drop in the number of workers in the mines, France and Belgium have closed down marginal diggings in mistaken anticipation of a coal surplus for 1951; and in Germany a low rate of investment in the mines combines with a steady drift of workers away from some pits, and a reluctance to move to the most productive veins.

Shortage of miners, of course, is a sociological problem connected with individual desires for an easier way of life. As such it is not easily amenable to democratic control. But, if the miners cannot be forced underground, at least certain inducements can be provided to keep them there or to attract newcomers. Italian mine workers, for instance, are kept away from England by labor-union prohibition. It is reported that thousands of German miners are living in

barracks away from their families. Here a housing program would, at no great expense, accomplish much toward making the miner's lot more attractive. Other measures are necessary, and those measures need to be taken before Europe becomes permanently saddled on the back of America.

Brief on Communism

EXTENSION OF REMARKS

OF

HON. WALTER E. ROGERS

OF TEXAS

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. ROGERS of Texas. Mr. Speaker, the American Bar Association has prepared a brief on Communism: Marxism-Leninism, its aims, purposes, objectives, and practices. The document is a concise but full treatise on the subject. The exhaustive research and work of the committee in preparing this brief is fully evidenced by the excellent manner in which the facts are presented. It is a document that should be read by every American citizen to the end that all would be better fortified in the battle that has been joined against the insidious practices of those who would destroy our rights and our freedoms. The committee that prepared this brief is entitled to the highest commendation of the American people.

I place this brief in the CONGRESSIONAL RECORD and earnestly request that all who have the opportunity of reading it pass it on to their neighbors:

COMMUNISM: MARXISM-LENINISM, ITS AIMS, PURPOSES, OBJECTIVES, AND PRACTICES

This brief is produced to explain why the American Bar Association has resolved to expel and recommended the disbarment of all lawyers who are members of the Communist Party of the United States or who advocate "Marxism-Leninism".¹

¹ The resolutions follow:

RESOLUTION I

Whereas the Communist Party and Marxism-Leninism call for the establishment in the United States of a dictatorship "untrammeled by law", and

Whereas the American constitutional system and the American principle of individual rights and duties would be violated by such a system, and

Whereas such concept is incompatible with the obligations of a lawyer as an officer of the courts of the United States and the several States. Be it now, therefore

Resolved, That the American Bar Association proceeding only the manner provided in its constitution and bylaws expel from its membership any and every individual who is a member of the Communist Party of the United States, or who advocates Marxism-Leninism; and be it further

Resolved, That this resolution be referred immediately by the president of the association to an appropriate committee of the association for prompt action.

RESOLUTION II

Be it resolved, That resolution I be referred to all State and local bar associations with the recommendation that they expel from their membership any and every individual who is a member of the Communist Party of

Implicit in this action by the Association is the conviction that Communists and communism constitute a menace to the integrity of the American constitutional system which the association through its membership is sworn to uphold and defend

In the debate on the resolution it became evident that there is widespread ignorance and confusion throughout the United States concerning the nature of communism and concerning the objects and purposes of those people in this country and elsewhere who embrace and follow Communist teachings. In large part the confusion is deliberately created by the Communists themselves. The advancement of the Communist movement in America depends for success upon a general misunderstanding of Communism and of Communist aims on the part of those outside the fold

If the real purposes, aims, tactics and practices of communism were as clear to all Americans as they undoubtedly are to the Communists themselves, the popular revulsion of patriotic Americans against all who follow the conspiratorial cult and the Communist "line" would stop this subversive movement in its tracks

Hence, the purpose of this brief is to acquaint the American people with what communism really is—not by way of objective interpretation but essentially by letting communism speak for itself through its official spokesmen in their authoritative texts:

The Communist Manifesto (C M), Marx and Engels

State and Revolution (S R), Lenin
"Left Wing" Communism: An Infantile Disorder" (L W), Lenin

Foundations of Leninism (F L), Stalin.
Problems of Leninism (P L), Stalin

"History of the Communist Party of the Soviet Union" (S H) (Bolsheviks) authorized by the Central Committee of the C P S. U. (B), edited by a Commission of the Central Committee of the C P S. U. (B) and edited by a Commission of the Central Committee of the C P S. U. (B) and published by International Publishers (N. Y. Inc. Copyright 1939, published 1938)

The Communist Manifesto (36 pages—price 10 cents) was published in 1848—but it became and is the Old Testament of and for all Communists. It states the basic theory of communism

Lenin implemented the theory of Marx into actual revolution and (1917) his two books became the new testament of and for all Communists. (For extended reading see Lenin's Collected Works—some 60 volumes.)

Stalin in his two basic volumes has extended the "theory" of Marx and practices of Lenin into the present practical application that now controls the thoughts and actions of 800,000,000 people of the world

The History is a short course—required reading for all Communists, has been translated into some 200 languages and dialects. From time to time in new editions as historical materialism may require, the facts of history are changed or obliterated. It is the

the United States or who advocates Marxism-Leninism; be it further

Resolved, That a copy of this report be sent to all State and local bar associations in the United States for the information of the members thereof.

RESOLUTION III

Be it resolved, That the American Bar Association recommend that all State and local bar associations or appropriate authorities immediately commence disciplinary actions of disbarment of all lawyers who are members of the Communist Party of the United States or who advocate Marxism-Leninism (Adopted by House of Delegates, ABA, February 1951).

² For the sake of brevity the initials of these books will be used in this brief.

party bible and replaces the necessity of reading the Old and New Testament.

THE COMMUNIST MANIFESTO (1848)—THE THEORY OR PHILOSOPHY OF MARX AND ENGELS

Seizure of power and retention of power throughout the world by the proletariat is only a matter of time. The establishment of the dictatorship of the proletariat is inevitable

"The theory of the Communists may be summed up in one single sentence: Abolition of private property."

"And the abolition of this state of things is called by the bourgeois, abolition of individuality and freedom. And rightly so. The abolition of bourgeois individuality, bourgeois independence, and bourgeois freedom is undoubtedly aimed at."

"In a word, you reproach us with intending to do away with your property. Precisely so, that is just what we intend."

"The charges against communism made from a religious, a philosophical, and, generally, from an ideological standpoint, are not deserving of serious examination."

"The proletariat will use its political supremacy to wrest, by degrees, all capital from the bourgeoisie, to centralize all instruments of production in the hands of the state, i. e., of the proletariat organized as the ruling class."

The manifesto then lays down 10 preliminary steps to be attained before the dictatorship of the proletariat takes over.

1 Abolition of property in land and application of all rents of land to public purposes

2 A heavy progressive or graduated income tax

3 Abolition of all right of inheritance.

4 Confiscation of the property of all emigrants and rebels

5 Centralization of credit in the hands of the state, by means of a national bank with state capital and an exclusive monopoly.

6 Centralization of the means of communication and transport in the hands of the state

7 Extension of factories and instruments of production owned by the State; the bringing into cultivation of waste lands, and the improvement of the soil generally in accordance with a common plan

8 Equal obligation of all to work. Establishment of industrial armies, especially for agriculture

9. Combination of agriculture with manufacturing industries, gradual abolition of the distinction between town and country, by a more equitable distribution of the population over the country.

10 Free education for all children in public schools. Abolition of child factory labor in its present form. Combination of education with industrial production, etc

The final paragraph of the manifesto:

The Communists disdain to conceal their views and aims. They openly declare that their ends can be attained only by the forcible overthrow of all existing social conditions. Let the ruling classes tremble at a Communist revolution. The proletarians have nothing to lose but their chains. They have a world to win

REVOLUTION—FORCE AND VIOLENCE

Is the dictatorship of the proletariat to come into power by revolution in the sense of a peaceful political or economic change within the framework of any government, or does revolution mean force and violence?

We have already said above and shall show more fully later that the teaching of Marx and Engels regarding the inevitability of a

³ As defined by the authors: (1) We are all "bourgeois," (2) we are now living in the epoch of imperialism; (3) "peasants" are human beings as distinguished from "bourgeois," "workers," and "intelligentsia."

violent revolution refers to the bourgeois state. It cannot be replaced by the proletarian state (the dictatorship of the proletariat) through withering away, but, as a general rule, only through violent revolution. * * * The necessity of systematically fostering among the masses this point of view about violent revolution lies at the root of the whole of Marx's and Engels' teaching.

The replacement of the bourgeois by the proletarian state is impossible without a violent revolution (Lenin, S. H. 19-20).

It is clear that the liberation of the oppressed class is impossible not only without a violent revolution, but also without the destruction of the apparatus of state power.

"The dictatorship of the proletariat is the most determined and the most ruthless war waged by the new class against the * * * enemy * * * the dictatorship of the proletariat is necessary, and victory over the bourgeoisie is impossible, without a long, stubborn and desperate war of life and death, a war which requires perseverance, discipline, firmness, inflexibility, and unity of will" (Lenin, L. W. 9).

"It follows that for revolution it is essential, first, that a majority of the workers (or at least a majority of the class-conscious, thinking, politically active workers) should fully understand the necessity for revolution and be ready to sacrifice their lives for it; secondly, that the ruling classes be in a state of governmental crisis * * * and makes it possible for the revolutionaries to overthrow it rapidly" (Lenin, L. W. 65).

Stalin confirms.

"Can such a radical transformation of the old bourgeois system of society be achieved without a violent revolution without the dictatorship of the proletariat?"

"Obviously not. To think that such a revolution can be carried out peacefully within the framework of bourgeois democracy * * * means one of two things. It means either madness, and the loss of normal human understanding, or else an open and gross repudiation of the proletarian revolution" (Stalin, P. L. 20).

"Lenin always taught that without a revolution of the working class capitalism cannot be overthrown" (S. H. 168).

Finally, as to the Marx, Engels, Lenin definition of "Revolution" (Lenin is contemptuously castigating his "fellow travelers", (the Mensheviks) who argued for "Revolution" as a theory to be accomplished by peaceful means):

"Have these gentlemen ever seen a revolution? Revolution is undoubtedly the most authoritative thing possible. It is an act in which one section of the population imposes its will on the other by means of rifles, bayonets, cannon, i. e., by highly authoritative means and the victorious party is inevitably forced to maintain its supremacy by means of that fear which its arms inspire in the reactionaries. (Would the Paris Commune have lasted a single day had it not relied on the authority of the armed people against the bourgeoisie? Are we not, on the contrary, entitled to blame the Commune for not having made sufficient use of this authority?) And so, either—or; either the anti-authoritarians do not know what they are talking about, in which case they merely sow confusion; or they do know, in which case they are betraying the cause of the proletariat. In either case they serve only the interests of reactions" (Lenin, S. R. 53).

IS THE REVOLUTION LIMITED TO CONTINENTAL RUSSIA?

"International imperialism with all the might of its capital and its highly organized military technique, which represents a real force, a real fortress of international capital, could under no circumstances, under no possible conditions, live side by side with the

Soviet Republic, both because of its objective situation and because of the economic interests of the capitalist class which was incorporated in it, it could not do this because of commercial ties and of international financial relationships. A conflict is inevitable. This is the greatest difficulty of the Russian Revolution, its greatest historical problem; the necessity to call forth the world revolution" (Stalin, P. L. 20).

Stalin quoting Lenin (Collected Works, Russian edition) says:

"We are living," Lenin writes, "not merely in a state but in a system of states, and it is inconceivable that the Soviet Republic should continue to exist for a long period side by side with imperialist states. Ultimately one or the other must conquer. Meanwhile a number of terrible clashes between the Soviet Republic and the bourgeois states is inevitable. This means that if the proletariat, as the ruling class, wants to and will rule, it must prove it also by military organization."

"Clear, one would think!" (Stalin, P. L. 67.)

Stalin quotes Lenin again on world revolution:

"Hence, the victory of socialism is possible, first in a few or even in one single capitalist country taken separately. The victorious proletariat of that country, having expropriated the capitalists and organized its own socialist production would rise against the rest of the capitalist world, attract to itself the oppressed classes of other countries, raise revolts among them against the capitalists, and in the event of necessity, come out even with armed force against the exploiting classes and their states" (Collected Works) (Stalin, P. L. 69).

Again he quotes and states:

"The existence of two diametrically opposed social systems gives rise to the constant menace of capitalist blockade, or other forms of economic pressure, of armed intervention, of restoration. Consequently, nothing but a victorious socialist revolution in a number of countries can provide the guaranty for the final victory of socialism, that is to say, guaranties against restoration. * * * Leninism teaches that the final victory of socialism, in the sense of full guaranty against the restoration of bourgeois relations, is possible only on an international scale" (Stalin, P. L. 71).

"Imperialism has not only made revolution a practical necessity, it has created favorable conditions for a direct attack on the citadels of capitalism" (Stalin, P. L. 13).

"The main task of contemporary communism in western Europe and America is to acquire the ability to seek, to find, to determine correctly the concrete path, or the particular turn of events that will bring the masses right up to the real, decisive, last and great revolutionary struggles" (Lenin, L. W. 78).

"We do not know which spark will kindle the conflagration" (Lenin, L. W. 79).

"Then there is the question: can a country in which the dictatorship of the proletariat has been established, consider itself fully guaranteed against foreign intervention, and consequently against the restoration of the old order, without the victory of the revolution in a number of other countries, a question which must be answered in the negative" (Stalin, P. L. 62).

"What is needed is the ability to find at any moment that particular link in the chain which must be grasped with all one's might to gain control of the whole chain and pass without a hitch to the next link" (Lenin) (Stalin, P. L. 190).

POWER AND POWER ALONE IS THE FUNDAMENTAL CONCEPT OF THE DICTATORSHIP OF THE PROLETARIAT

Both in theory and in practice the ultimate aim of communism is the establish-

ment throughout the world of the dictatorship of the proletariat.

"The question of power is the fundamental question of revolution. The seizure of power is only the beginning. Therefore, the important thing is to retain power, to consolidate it and make it invincible. What is required to attain this end? At least three main tasks confronting the proletariat on the morrow of its victory must be fulfilled. They are: (a) to break the resistance of the landed proprietors and capitalists now overthrown and expropriated by the revolution, and to liquidate every attempt they make to restore the power of capital; (b) to organize construction in such a way as will rally all toilers around the proletariat and prepare the way for the liquidation, the extinction of classes; (c) to arm the revolution and to organize the army of the revolution for the struggle against the external enemy and for the struggle against imperialism.

"The dictatorship of the proletariat is necessary in order to carry out and fulfill these tasks" (Stalin, P. L.).

"The supreme principle of the dictatorship is the preservation of the alliance between the proletariat and the peasantry, in order that the proletariat may continue to retain the leading role and state power" (Stalin, P. L. 24).

"It by no means follows that during the period of construction, the coercive side of the dictatorship has fallen away, or can fall away. The organs of suppression, the army and other organizations, are as necessary now in the period of construction as they were during the civil war period" (Stalin, P. L. 27).

"You will have to go through 15, 20 or even 50 years of civil and international war" (Marx) (Stalin, P. L. 47).

"The dictatorship of the proletariat is a revolutionary power based on violence against the bourgeoisie" (Stalin, P. L. 41).

"The concept of the dictatorship of the proletariat is a concept of the state. The dictatorship of the proletariat must necessarily include the concept of violence. There is no dictatorship without violence. If dictatorship is to be understood in the strict sense of the term Lenin defines dictatorship of the proletariat as 'power based directly on violence' (Collected Works) (P. L.).

"To put it briefly: the dictatorship of the proletariat is the domination of the proletariat over the bourgeoisie, a domination that is untrammelled by law and based on violence and enjoys the sympathy and support of the toiling and exploited masses (cf. Lenin, State and Revolution)" (Stalin, P. L.).

"THE PARTY" IS THE DICTATORSHIP OF THE PROLETARIAT, AND ARE THE MASSES THE PARTY?

"One of the most important ideas of Marxism on the subject of the state, namely, (1) the idea of the 'dictatorship of the proletariat'.

"The state, that is, the proletariat organized as the ruling class" (Lenin, S. R. 23).

"The proletariat needs state power, the centralized organization of violence" (Lenin, S. R. 23).

"Only the class conscious minority (that is, the party, J. S.) can lead the broad masses of the workers. That it is precisely in this sense that by the dictatorship of the proletariat we mean, in essence, the dictatorship of its organized and class conscious minority" (Stalin, P. L. 36).

"Not a single important decision is arrived at by the mass organizations of the proletariat without directions from the party" (Stalin, P. L. 36).

"The party, with a membership of several hundred thousand, leads the Soviets, with their national and local ramifications, which embraces several millions of people" (Stalin, P. L. 39).

"Any other conception of leadership is syndicalism, anarchism, bureaucracy or anything you please; but not Bolshevism, not Leninism" (Stalin, P. L. 53).

"Every army at war must have an experienced staff if it is to avoid certain defeat. All the more reason, therefore, why the proletariat must have such a general staff if it is to prevent itself from being routed by its accursed enemies. But where is this general staff? Only the revolutionary party of the proletariat can serve as this general staff. A working class without a revolutionary party is like an army without a general staff. The party is the military staff of the proletariat."

The disciplined party, says Lenin, will not enroll:

* * * every professor and student.
* * * every sympathizer and striker (Lenin, F. L.).

"Only the Soviet state organization can definitely destroy at one blow the old, i. e., the bourgeois administrative and judicial apparatus" (Stalin, F. L.).

"The Soviet power combines the legislative and executive functions in a single state body" (Stalin, F. L.).

"It follows that the existence of factions is incomplete with party unity and with iron discipline * * * the parties of the Communist International * * * cannot afford to be liberal or to permit the formation of factions. The party is synonymous with unity of will, which leaves no room for any factionalism or division of party control" (F. L.).

The peasants, the largest class and the great majority of the people in Russia, are not part of the dictatorship of the proletariat.

The peasants, says Stalin, are the "proletariat's greatest reserve power" (Stalin, F. L. 42).

"Its quintessence (that is, of the dictatorship—J. S.) lies in the organization and discipline of the advanced detachments of the toilers, of their vanguard, their sole leader, the proletariat" (Stalin, F. L. 26).

"Now we must consider the dictatorship of the proletariat from the point of view of its structure, of its mechanism, of the role and significance of the belts, the levers, and the directing force, the totality of which comprise the system of the dictatorship of the proletariat and with the help of which the daily work of the dictatorship of the proletariat is accomplished" (Stalin, P. L. 29).

The organizations are. First, of all these are the workers' trade-unions. They are not party organizations. They constitute a school of communism. They unite the masses of workers with their vanguard.

Secondly, we have the Soviets. The Soviets are mass organizations of all the toilers of town and country. They are not party organizations. The Soviets unite the vast toiling masses with the proletarian vanguard.

Thirdly, we have cooperative societies of all kinds. These are mass organizations of toilers, not party organizations.

Fourthly, there is the Young Communist League. Not a party organization.

Lastly, there is the party of the proletariat, its vanguard. The party's strength lies in the fact that it draws into its ranks all the best elements of the proletariat from all the mass organizations of the proletariat. Its function is to combine the work of all the mass organizations of the proletariat, without exception, and to guide their activities toward a single goal, that of the emancipation of the proletariat. Only the vanguard of the proletariat, its party, is capable of combining and directing the work of the mass organizations of the proletariat. Only the party of the proletariat, only the party of the Communists, is capable of fulfilling this role of chief leader in the system of the dictatorship of the proletariat." (Stalin, P. L. 29 to 32.)

"The party realizes the dictatorship of the proletariat. The party is the direct governing vanguard of the proletariat; it is the leader" (Lenin). In this sense the party takes power, the party governs the country" (Stalin, P. L.).

"The dictatorship of the proletariat must not be contrasted with the leadership (the 'dictatorship') of the party. It is inadmissible because the leadership of the party is the principal thing in the dictatorship of the proletariat" (Stalin, P. L. 45).

"Here in the Soviet Union, in the land of the dictatorship of the proletariat, the fact that not a single important political or organizational question is decided by our Soviet and other mass organizations without direction from the party must be regarded as the highest expression of the leading role of the party. In this sense it could be said that the dictatorship of the proletariat is in essence the 'dictatorship' of its vanguard, the 'dictatorship' of its party, as the main guiding force of the proletariat" (Stalin, P. L. 34).

"The political party can organize only a minority of the class in the same way as the really class conscious workers in capitalist society can represent only a minority of all the workers. That is why we must admit that only this class conscious minority can lead the broad masses of the workers" (Collected Works, vol. XXV, p. 347, Russian edition) (Stalin, P. L. 35).

The Short History in its "Conclusion" states:

"The history of the party teaches us that to leave the proletariat without such a party means to leave it without revolutionary leadership, and to leave it without revolutionary leadership means to ruin the cause of the proletarian revolution.

"The history of the party teaches us that the ordinary Social-Democratic Party of the West-European type, brought up under conditions of civil peace, trailing in the wake of the opportunists, dreaming of 'social reforms,' and dreading social revolution, cannot be such a party.

"The history of the party teaches us that only a party of the new type, a Marxist-Leninist party, a party of social revolution, a party capable of preparing the proletariat for decisive battles against the bourgeoisie and of organizing the victory of the proletarian revolution, can be such a party.

"The Bolshevik Party in the U. S. S. R. is such a party" (S. H. 353).

"* * * in the Soviet Union the Bolshevik Party and the State are inseparable" (S. H. 285).

Comment:

(a) Executive, legislative, and judicial powers is confined to the party. Actually it is confined to 10 men who having seized power retain it. There is no majority rule. There is Government only by and from a select few of the minority—the Politburo.

(b) When Lenin seized power from the people who overthrew the Czar in 1917 the Bolshevik Party membership did not exceed 40,000 or 45,000.

In the February 1951 meetings of the American Bar Association, when the house of delegates was considering the resolution to authorize this document a delegate suggested that he had looked up the definition of Bolshevik, and it meant the majority. It does.

Bolshevik—majority.

Menshevik—minority.

By force and violence the Lenin-Stalin Party became the majority and liquidated the minority—the Mensheviks.

The first all-Russian Congress of Soviets met June 3 (16) 1917. The Bolsheviks had 100 delegates. The Mensheviks, Social-Democrats, and others 700 or 800 delegates (S. H. 192).

The Sixth Congress of the Bolshevik Party met secretly July 26 to August 3, 1917. "At

that time the party had a membership of about 240,000" (S. H. 195-6).

(N. B. Of those present only the names of Comrades Stalin and Molotov are names now extant.)

The seventh congress opened March 6, 1918. "This was the first congress held after our party had taken power * * * the membership at this time was not less than 270,000" (S. H. 218). However, the delegates represented only 145,000 party members (id.).

The eighth congress met in March 1919. It represented 313,766 party members (S. H. 232).

The ninth congress met in March 1920, 611,978 party members (S. H. 254).

"In March 1922, the party held its eleventh congress. It was attended by 522 voting delegates, representing 522,000 party members. The reduction in the membership was due to the party purge which had already begun" (S. H. 260).

"The party is strengthened by purging itself of opportunist elements" (F. L. 118).

In April 1923, the party held its twelfth congress, 386,000 party members (S. H. 282).

In May 1924, the party held its thirteenth congress, 733,881 party members.

"The marked increase in membership * * * was due to the admission of some 250,000 new members under the Lenin enrollment" (S. H. 269).

Lenin died January 21, 1924.

Stalin's vow

"We vow to you, Comrade Lenin, that we will not spare our lives to strengthen and extend the union of toilers to the whole world" (S. H. 269).

The fourteenth congress opened in December 1925, 643,000 party members.

"The reduction was due to a partial purge, a purge of the party organizations in universities and offices to which anti-party elements had gained entrance" (S. H. 276).

The fifteenth congress met in December 1927. In October preceding * * * 724,000 party members voted for the policy of the Central Committee; 4,000, or less than 1 percent for the block of Trotskyites and Zinovievites" (S. H. 285). Zinoviev (later liquidated) and Trotsky, formerly commander in chief of the Red army, and "the chief instigator and ringleader of this gang of assassins and spies was Judas Trotsky" (S. H. 327), were expelled.

The sixteenth congress met June 26 1930—1,260,874 party members (S. H. 320).

The seventeenth congress met in January 1934—1,874,488 party members (S. H. 320).

Apparently as far as the "History" is concerned it was not necessary to meet again. However, it did meet in March, 1939.

"One cannot but recall Lenin's golden words uttered at the Eleventh Congress of our party 'Among the masses of the people, we (Communists—J. S.) are but drops in the ocean'" (Stalin P. L. 59).

Thus the word "Bolshevik"—now "The Party" means the "Majority"; i. e. a "minority" holding control by

(a) "Firm discipline" (S. H. 42).

(b) "The finest members of the class" (S. H. 48).

(c) "Democratic centralism"—Government from the top down—"the subordination of lower party bodies to higher party bodies." (S. H. 49, 89).

(d) The "purge": "Condemnation of all the opposition groups" (S. H. 254).

"This resistance to the party policy was one more reminder that the party needed to be purged of unstable elements. Accordingly, the Central Committee in 1921 organized a party purge, which helped to considerably strengthen the party. Lenin advised that the party be thoroughly cleansed 'of rascals, bureaucrats, dishonest or wavering Communists, and of Mensheviks who have repented their ficade' but who have remained Mensheviks at heart" (S. H. 259).

One hundred and seventy thousand were purged in 1921.

"The party became more closely welded and better disciplined." (S. H. 250) better "disciplined" from the top. The first stage is the purge—(S. H. 295, 360)—the final—liquidation.

However, after a purge and/or liquidation—and death from natural causes, if any, the party requires new members upon whom it can depend to keep the leader in control.

New members are "admitted," but only "on the basis of a strictly individual enrollment of 'people really advanced and really devoted to the cause of the working class, the finest people of our country, drawn above all from among the workers, and also from among peasants and active intelligentsia, who had been tried and tested in various sectors of the struggle for socialism'" (S. H. 329).

THE PRACTICES OF THE DICTATORSHIP OF THE PROLETARIAT

Reading the Communist manifesto was, before the Short History, a must for Communists.

However, assuming the Communist reader could not digest or even read all of the manifesto, or could not read, he was then and now compelled to believe implicitly in the 10 postulates and to believe in but one formula—the dictatorship of the proletariat—where the powers of government, the executive, legislative, and judicial are combined in one body. He must believe that to function the dictatorship of the proletariat shall be controlled by the party; that as a member of the party or a party organization he must obey every edict from the top; that discipline, the purge, liquidation are essential elements of party power.

As in the past, a Communist today must believe that he who makes the laws shall likewise execute the laws and the party in power sit in judgment on its own action.

The individual Communist belongs to the state—not the state to him.

And he does believe it is his duty to the party—not to God, because he has no God—to serve mankind by establishing for him all over the world—the dictatorship of the proletariat.

It was logical, therefore, that there be set up in 1919 (March) the Comintern—a Communist-controlled international organization which through long-range planning would prepare the way for the dictatorship of the proletariat in all alien lands.

Stalin in stipulating as a condition to recognition of the Soviet Union, by the United States, that the Comintern would not pursue its objectives in this country, was only zig-zagging and zagging entirely in accordance with Soviet policy (S. H. 73).

Supposedly dissolved during World War II, this international organization now operates as the Cominform under direct orders and financing from Moscow (See congressional committee reports).

Hence, the Communists have "strenuously fought and preserved the viewpoint that it is obligatory to combine legal and illegal forms of struggle, that it is obligatory to participate even in the most reactionary parliament and in a number of other institutions that are restricted by reactionary laws. (Insurance societies, etc.) (Lenin, L. W. 21.)

"It is necessary to agree to any and every sacrifice, and even—if need be—to resort to all sorts of devices, maneuvers, and illegal methods, to evasion and subterfuge, in order to penetrate into the trade unions, to remain in them, and to carry on Communist work in them at all costs (Lenin, L. W. 38).

"When conditions are such that it is often necessary to hide leaders underground, the development of good, reliable, experienced, and authoritative leaders is an especially hard task, and these difficulties cannot be successfully overcome without combining legal with illegal work, without setting the

leaders, among other ways, also on the parliamentary arena" (Lenin, L. W. 47).

Every effort must be made to save the Left Communists and the West European and American revolutionaries, devoted to the working class . . . from deviation from Marxism (Lenin, L. W. 53).

To the one's hands beforehand, openly to tell the enemy who is now better armed than we, whether and when we shall fight him is being stupid, not revolutionary . . .

These politicians of the revolutionary class who are unable to maneuver, to compromise in order to avoid an obviously disadvantageous battle are good for nothing (Lenin, L. W. 58).

In "parliament and every other type of reactionary institution, you must work inside them, precisely because in them there are still workers who are stupefied by the priests and by the desolation of village life; otherwise you run the risk of becoming mere babblers" (Lenin, L. W. 42).

"Revolutionaries who are unable to combine illegal forms of struggle with every form of legal struggle are very bad revolutionaries" (Lenin, L. W. 76).

"What is the difference between revolutionary tactics and reformist tactics? Some are of the opinion that Leninism is opposed to reforms, opposed to compromises and to agreements in general. That is absolutely untrue. Bolsheviks know as well as anybody else that every little bit helps, that under certain conditions reforms in general, and compromises and agreements in particular, are necessary and useful" (Lenin, L. W. 100).

"The revolutionist will accept a reform in order to use it as a means wherewith to link legal work with illegal work, in order to use it as a screen behind which his illegal activities for the revolutionary preparation of the masses for the overthrow of the bourgeoisie may be intensified" (Stalin, L. W. 101).

So the Communists have (a) infiltrated the labor unions, (b) worked "within parliament", (c) placed their personnel in key positions within the Government; (d) organized front after front; (e) recommended in current official literature more and more infiltration in all schools and universities, (f) infiltrated the press—the radio—the movies—the publishing houses; (g) organized smear campaigns upon both the living and the dead; (h) rewritten their own history of the Soviet Union and distorted our factual history; (i) accepted the benefits of our Bill of Rights in order to destroy our Constitution and form of government, (j) attempted to disorganize our courts and bring judges and justices into disrepute.

In this connection, in 1934, the International Labor Defense (Comintern) issued its pamphlet No. 5 entitled "Under Arrest—Workers Self-Defense in the Courts":

"HOW TO DEFEND YOURSELF IN COURT—WHAT TO DO WHEN ARRESTED AND QUESTIONED"

"FOREWORD"

"This pamphlet is being issued in order to better prepare our whole organization to give leadership to workers on what to do when arrested and questioned, and how to defend themselves in the courts of the capitalist class justice."

A few excerpts are taken from the pamphlet:

"The dignity and 'sanctity' of the courts, are a means of paralyzing the struggle of the workers against capitalist institutions.

"The class struggle goes on in the courtroom as well as it does on the picket line, in the shops, and in the mines. The worker must learn to carry into the courtroom the same determined militancy that brought him there.

"Even though capitalist law makes what you have done a crime, you must plead 'not guilty,' never plead 'guilty.'"

There is a specific section which deals with the conduct to be observed in the courtroom, part of which reads as follows:

"MAKE THE COURT YOUR FORUM"

"Bring out the class issues at the trial. If you are charged with criminal syndicalism, i. e., with teaching or advocating the overthrow of government by force or violence or charged with membership in an organization that advocates and teaches such a doctrine, and then the proof by the district attorney consists of speeches that you made, articles that you wrote, newspapers that you read and support, then it is absolutely necessary for you to use the court for a clear and correct explanation of the economic and social views which you hold, of the facts of the class struggle as applied to your case.

"It is important that you insist upon answering questions put to you in your own way. Do not allow yourself to be bulldozed by the prosecutor and judge who may demand of you a 'Yes' or 'No' answer. You either answer your own way, or not at all."

Note how well the instructions in that pamphlet were followed by defendants and their counsel at the historic trial before Judge Medina and a Federal court jury in New York. Observe the conduct of the Mass Workers during the trial in picketing the court house, jamming the court room, flaunting party line banners and chanting Communist slogans. It was all right out of the book.

WHAT DO THESE GENTLEMEN THINK OF THE UNITED STATES

"Marx splendidly grasped this essence of capitalist democracy, when, in analyzing the experience of the Commune, he said that the oppressed were allowed, once every few years, to decide which particular representatives of the oppressing class should be in parliament to represent and repress them.

"To decide once every few years which member of the ruling class is to repress and oppress the people through parliament—this is the real essence of bourgeois parliamentarism, not only in the parliamentary-constitutional monarchies, but also in the most democratic republics" (Lenin, S. R. 40).

Lenin quotes Engels on Marx:

"The ultimate political aim is to overcome the whole state, and therefore democracy as well" (Lenin, S. R. 67).

"Democracy for the vast majority of the people, and suppression by force, i. e., exclusion from democracy of the exploiters and oppressors of the people—this is the modification of democracy during the transition from capitalism to communism" (Lenin, S. R. 73).

"In Western Europe and America parliament has become an object of special hatred to the advanced revolutionaries of the working class" (Lenin, L. W. 45-46).

Lenin argues that it is impossible "to bring about victory of the Soviets over parliament without getting our 'Soviet' politicians into parliament, without disrupting parliamentarism from within, without preparing the ground within parliament for the success of the Soviets' forthcoming task of dispersing parliament" (Lenin, L. W. 61).

THE COMMUNIST PARTY OF THE UNITED STATES

To those not familiar with and who do not fully understand the language of dialectical materialism, as employed by the Communists, it might well appear that the present constitution of the Communist Party of the United States is within the framework of our system of government. To the uninitiated it might be argued convincingly that the Communist Party of the United States is a "political party."

The precepts of our own Declaration of Independence and the Constitution of the United States are known to most of us. (Cf. The Key to Peace—Clarence Manion, dean of the College of Law at Notre Dame.)

Most of us will probably agree that our political Old Testament is the Declaration of Independence:

"We hold these truths to be self-evident: That all men are created equal; that they are endowed by their Creator with certain unalienable rights; that among these are life, liberty, and the pursuit of happiness; that to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed" (preamble).

Our New Testament is the Constitution of the United States:

"We the people of the United States, in order to form a more perfect union, establish justice, insure domestic tranquillity, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this Constitution for the United States of America" (preamble).

In contrast, note the preamble to the constitution of the Communist Party of the United States:

"The Communist Party of the United States is the political party of the American working class, basing itself upon the principles of scientific socialism, Marxism-Leninism."

The application for party membership when in use contained the preamble:

The membership card of the Communist Party of the United States of America under "Rights and duties of party members" did provide that the members shall "strive to master the program and policies of the party, the principles of Marxism-Leninism."

To make it more difficult to prove that Mr. X is a member the membership cards have been abolished, the membership list is "underground."

However, irrespective of what the body of the constitution of the Communist Party of the United States may seem to say, the members must endorse and absorb the dialectic "principles of scientific socialism, Marxism-Leninism."

WHAT IS MARXISM?

Lenin defines it.

"A Marxist is one who extends the acceptance of class struggle to the acceptance of the dictatorship of the proletariat" (Lenin, S. R. 31).

WHAT IS LENINISM?

Stalin defines it.

"Leninism is Marxism in the epoch of imperialism and of the proletarian revolution, or, to be more exact, Leninism is the theory and tactics of the proletarian revolution in general, and the theory and tactics of the dictatorship of the proletariat in particular" (Stalin, F. L.).

"Leninism is a school of theory and practice which trains a special type of worker for the party and the state and creates a special Leninist style. What are the special features (a) the wide outlook of the Russian revolutionist and (b) American practicality."

"Only a party which has mastered the Marxist-Leninist theory can confidently advance and lead the working class forward. The Marxist-Leninist theory is the science of the development of society, the science of the working-class movement, the science of the proletarian revolution, the science of the building of a Communist society" (S. H. 355).

WHAT IS THE DICTATORSHIP OF THE PROLETARIAT?

Stalin defines it:

"To put it briefly, the dictatorship of the proletariat is the domination of the proletariat over the bourgeoisie, a domination that is untrammelled by law and based on violence and enjoys the sympathy and support of the toiling and exploited masses" (Stalin, F. 4, supra).

Comment: If it be suggested that nothing has been said about the Constitution of the

U. S. S. R., the answer is that little need be said. Its constitution is camouflage for the unwary.

The U. S. S. R. is governed under that constitution precisely as directed by Stalin and the Politburo. We need pay no more attention to that constitution than does the party's own Short History.

The Eighth Congress of the Soviets (not the Party) adopted a new constitution in November 1930 (S. H. 341-6).

"The Soviet Country thus acquired a new constitution a constitution embodying the victory of socialism and workers' and peasants' democracy" (S. H. 346).

In the Short History, the word party referring to the Bolshevik Party is always spelled with a capital "P." The word "democracy" is spelled with the lower case "d." Dealing with historical materialism the spelling is significant. To the Communist, democracy is a front for capitalism and with the small "d" it is purged. The party with a capital "P" is power—power over and destructive of democracy.

No matter the language used in the body of the constitution of the Communist Party of the United States, to assert the claim that it is a political party the member must accept the doctrine of Marxism-Leninism.

You may now understand why the American Bar Association has resolved to expel and recommends the disbarment of all lawyers who are members of the Communist Party of the United States, or who advocate Marxism-Leninism.

The advocate of Marxism-Leninism, whether or not a party member, is a Communist and as such must believe in the dictatorship of the proletariat. He must and does, no matter what he says, believe in the overthrow of our Government by force and violence. He has ceased to be an American.

The Communist Party of the United States is not a political party.

It is dominated by Moscow and exists above or below ground awaiting the day of the Revolution.

Perhaps before closing we should "explain" another confusing term—"dialectical materialism."

The Short History devotes pages 105 to 131, inclusive, in explanation of "dialectical and historical materialism" and uses words only to make other words more confusing.

However, being material, if not scientific, we proceed.

In life and time there is neither God nor truth.

Facts are what you make them, if they qualify "in the market place," that is the truth for today. Tomorrow it may be a different market place and an entirely different truth.

Two and two do not make four if the leader determines the answer is three or five.

Being materialists the truth is what those in power say it is.

In history facts, dates, individuals, groups, ideas, and reasons are changed to fit the present occasion, and in the next publication realigned to meet the then present occasion.

Obtain Orwell's "1984" from your library or book seller. Read it and compare it with the stated plans that Marx, Lenin, and Stalin have for us.

But with each set of changing truths, remember that the fact finders have their vision fixed on the terminus of the long road ahead—the ultimate goal—the dictatorship of the proletariat "all over the world."

The writers of this brief enjoy the following quotation from Lenin above all others.

"We want the Socialist revolution with human nature as it is now, with human nature that cannot do without subordination, control, and 'managers.' But if there is subordination, it must be to the armed vanguard to the proletariat" (Lenin, S. R.).

Perhaps that is why "in Russia we abolished the bourgeois legal bar, but it is

returning in the guise of Soviet legal defenders" (L. W.).

CONCLUSION

Adolf Hitler in *Mein Kampf* told the world precisely what he was going to do. Nobody believed him until he did exactly what he said he was going to do. Marx, Engels, Lenin, and Stalin are just as frank. "Clear, one would think," says Mr. Stalin (P. L.). And Stalin is doing precisely as they and he have spelled out the words.

Since the Communist Party of the United States is an integral part of the conspiratorial whole of communism, it is not a political party in any conceivable sense of that expression.

While all members of the Communist Party of the United States are Communist conspirators, all Communist conspirators are not members of the Communist Party. The most important, dangerous, and influential Communists or fellow travelers may be forbidden by their leaders to hold official membership in the party. They may and do have special work to do (cf. Hiss, White, and the like).

The safety of constitutional freedom in the United States demands, first, an exposure of Communist tenets and objectives—Marxism-Leninism—and, secondly, resistance to the advancement of their principles and the promotion of these objectives by any person, party, group, or organization.

Communism, Marxism-Leninism—establishment of the dictatorship of the proletariat, is definitely not a reform movement to make mankind happier, more prosperous, and free. It is a system which destroys freedom and establishes the complete slavery of all who are subject to it. Violence—force—is the only law it recognizes. Violence to obtain power and force to retain it.

Under the thesis of the Communist writers, supra, the individual will have lost both his liberty and his property. His very life hangs precariously on the whim of the dictator.

It was precisely to protect these three basic rights that the American constitutional concept was established by the founding fathers. The avowed purpose of communism is to destroy by force all that our constitutional system was designed to protect.

How can anyone after reading the official Communist writers, seriously contend that the Communist movement is a legal or constitutional project in the United States—where our Federal Constitution and that of all the States expressly calls for the protection of life, liberty, and property?

While they are ridiculing our courts, exciting and inflaming our "minority groups," infiltrating Government departments, labor unions, schools, the press, movies, and radio, you may depend upon the Communist conspirators to promote socialism and socialistic enterprises with their whole heart and to the full extent of their extensive resources. Pointing as they are toward the all-powerful state, they may be depended upon to support the increased domain of government in business, in credit, in transportation, in communication, in housing and power projects. If these socialistic enterprises were not conducive to the advancement of the Communist cause, the Communists would not support them—but they always do.

The conflict between communism and the American Republic is a conflict of basic ideas. It is a war of faith and freedom against despair and despotism. The American constitutional system was, as James Madison said, staked upon our faith in the capacity of

¹ *Dowd's case* (339 U. S. 382, 94 L. ed. 925, 956); *Schneiderman v. U. S.* (330 U. S. 118, 87 L. ed. 1796); *U. S. v. Dennis* (183 Fed. (2d) 201); *U. S. v. Dennis* (U. S. Advance Sheets, June 1951), *Martin v. Law Society of British Columbia* (3 Dom. L. rep. 173).

mankind for self-government. Our Government, rightly restricted by constitutional provisions, checks, balances and Bill of Rights, was given a very narrow, very special assignment. It was not designed to control all of us all around the clock, because the men who designed it were confident that the overwhelming majority of their fellow Americans would always be capable of controlling themselves according to the moral law of Him who created them. Our political and governmental coercions were meant to operate on the periphery of our society; for the eccentric few who had lost the moral power to control themselves. To construct such a system required great faith in God and in man. If our forefathers doubted and distrusted any one thing it was the power of government itself which Washington said was "like fire, a dangerous servant and a fearful master." They had faith in personal freedom as the gift of the Creator and they were confident that freemen under a constitutionally restricted government would build the best of all known civilizations.

It is this citadel of faith and freedom that the Communists now proceed to undermine with their materialistic dispensation of despair. The man whom God made in his own image the Communists would remake into a soulless serf. Read their Communist manifesto and see what they have in store for us—and how much of it they have already accomplished—right here in the United States of America.

That is why the American Bar Association became the vanguard in resolving to oust the fellow travelers of communism and Marxism-Leninism from its rolls, and recommended disbarment by the local bars.

Otherwise, unless we, the people of the United States establish an impassable barrier, as stated by one of the distinguished authors of the God That Failed, the final battle will be between Communists and ex-Communists—because the latter understand precisely the dictatorship of the proletariat—freedom versus slavery.

Defense Appropriation Bill

EXTENSION OF REMARKS OF

HON. CLEVELAND M. BAILEY

OF WEST VIRGINIA

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. BAILEY. Mr. Speaker, under leave to extend my remarks in the RECORD, I wish to include the following letter which was received from a serviceman's wife protesting the provisions of the defense appropriation bill, section 628:

WEST POINT, N. Y., September 24, 1951.
Representative CLEVELAND M. BAILEY,
House of Representatives,
Washington, D. C.

DEAR SIR: The defense appropriation bill contains a provision (sec 628) which may force the services to close their commissaries if the food prices are raised. The closing of these commissaries will cause a hardship for servicemen and their families.

In establishing the present pay scale for the armed services the advantage of low commissary prices was taken into consideration.

If this provision is approved and the prices are raised, causing the commissaries to close, it will amount to a substantial reduction in pay to the servicemen. If this happens a new bill should be approved by both

Houses at once—a new pay raise for the armed services based on the rise in the cost of living.

Little good has been gotten out of the past two pay raises. Quarters allowances were raised from \$37.50 to \$67.50; our rent was raised to \$67.50. Then the allowance was raised from \$67.50 to \$85; so up went our quarters rent to \$85. If the rent had stayed at the \$37.50 level the servicemen could say they had a pay raise; actually they haven't gained a cent.

If the prices in the commissaries are raised 20 percent then the pay should be raised 20 percent or higher.

If the Senators and the Representatives could change places with the service wives for a month, then they would see how foolish the provision is.

I hope you will consider the above facts when the bill comes to a vote.

Yours truly,

(Mrs.) LEVY H. COOK.

In Defense of Freedom

EXTENSION OF REMARKS

OF

HON. LISTER HILL

OF ALABAMA

IN THE SENATE OF THE UNITED STATES

Tuesday, October 2, 1951

Mr. HILL. Mr. President, on last Wednesday, September 26, 1951, Hon. Charles F. Brannan, Secretary of Agriculture, delivered an address at a meeting which was held under the auspices of the Alabama State Agricultural Mobilization Committee at Montgomery, Ala. It is a most informative and interesting address. I ask unanimous consent that it be printed in the Appendix of the RECORD.

There being no objection, the address was ordered to be printed in the RECORD, as follows:

IN DEFENSE OF FREEDOM

(Secretary of Agriculture Charles F. Brannan)

It is a real pleasure to have a part in this meeting devoted to one of the most urgent tasks in American history—the mobilization of our agriculture for the defense of freedom in the United States and in the world.

Let me express my pleasure also at being here in the home city of Alabama's distinguished senior Senator, LISTER HILL, who has served in the House and Senate for nearly 30 years. I want to pay tribute also to your very able junior Senator, JOHN SPARKMAN; and to GEORGE GRANT and the other members of the Alabama delegation in the House. The farmers of Alabama and of the Nation are fortunate in having two great friends of the caliber of LISTER HILL and JOHN SPARKMAN. No State in the Union is represented by more diligent Senators, nor by men more deeply concerned about the genuine welfare of American agriculture.

The whole Nation is fortunate in having the benefit of their knowledge and energies as we mobilize for defense—as we gather our resources—and as we defend our freedom.

We have made progress in these tasks. We have made so much progress that the plans of those who seek to grind the whole world under the heel of Communist domination will have to be modified.

That could not have been more evident than it was in San Francisco this month.

Out there a group of free nations of the world signed a peace treaty with Japan—a treaty that is unique in history. It is not a document of reprisal, involving huge reparations and other crippling penalties. It is a treaty that will help a defeated people—will help them regain stature and self-respect in the family of nations.

What these free nations did at San Francisco marks a great step forward in international relations.

But that is not all. These free nations gave the Soviet Union and its satellites a real diplomatic licking.

And the man who chiefly administered that licking was Dean Acheson, who has guided with a sure and steady hand the foreign policies of our country in the most critical years of our entire history.

After San Francisco, even most of his critics had to admit that Dean Acheson had done a superb job.

We've made a lot of progress—on the diplomatic front—on the military front—and on the economic front.

Yet the very fact that we have made this progress is one of the reasons why the present situation is critical.

Our enemies are confused and uncertain, and you can never tell what a confused, uncertain enemy is likely to do.

This is no time to relax. This is a time to increase our defense efforts. So I am happy to have this chance to discuss with you the part that agriculture plays in our national mobilization.

It's a good idea at a moment like this to step back and try to look at ourselves from a distance. Otherwise, as the saying goes, we might not see the forest for the trees. We might not see the whole picture—and it is absolutely vital to an understanding of agriculture's role in defense that we do see the whole picture as clearly as possible.

In recent months we've been reading about the plans scientists have for building a space platform, a station of some sort a few hundred miles off the earth.

Not being a scientist, I don't know whether such a platform in space is a practical possibility or not. But for the purpose of stepping back and looking at ourselves—of getting the whole picture of what's taking place on this globe—let's suppose we have such a platform. Let's suppose that we are on it. We're looking at the earth through giant telescopes. We direct our gaze first toward certain areas in Asia. What do we see?

We see a great mass of people seething with unrest. We see four persons out of five living as peasants on the land. We see them working long hours, working with the crudest kind of agricultural implements or no implements at all. We see them cultivating two or three acres and turning over up to nine-tenths of their crop to the landlord.

We see a mass of people, hungry and malnourished, their bodies preyed on by disease, their minds unawakened by education.

We see, in short, a fertile field for the seeds of communism—an eager willingness to turn to any person or any idea that promises a better life.

That's why we must tell the wonderful story of democracy to the whole world. We must show the power of democracy to solve these bitter problems. And we must live democracy here at home as an example of hope for the less fortunate everywhere.

In some areas of the world circumstances have led to the imposition of ruthless, cold-blooded Soviet dictatorship—and there's little that the people of those areas can do about it now.

Now that they are enslaved they are trained by their masters to look only to the state. They live, they work, and they die for the state.

So we see in much of Asia a vast seething lake of communism, a lake that is seeking to push outward, to overrun other lands—like the flooded rivers in the Middle West last summer overreached their boundaries and spread destruction over a large area.

That is the danger the free nations are defending against. Just as the people of the Midwest fought the flooded rivers with dikes, sandbags, and levees, and now seek more effective permanent protection, so the free nations of the world are working today to build up military dikes, economic levees, and permanent measures in defense of freedom to hold back this restless, dangerous Communist lake.

We can turn our telescope on Korea. We see one of the finest armies that ever existed fighting under the flag of the United Nations, determined to hold and drive back the flood wherever it attempts to surge forth.

We can turn our telescope to Indochina. There we see the traditionally fine French soldiers fighting their bitter and bloody battle against another part of the Communist lake.

We can turn to Western Europe. There we see the biggest united effort of all—a total of 12 nations in the North Atlantic Treaty Organization building a network of dams in economic, cultural, and military fields to preserve the cradle of western civilization against the major threat of the Red flood.

Are we going to succeed in this mighty effort in defense of freedom? Are we building fast enough and strong enough so that the Red lake will be contained—so that it will not break through and have to be drained in blood?

The next few years may provide the answer.

And that brings us to the purpose of this meeting tonight. That brings us to agriculture and its role in defense—and to the mobilization committees and your role in defense.

It is hardly necessary to say that agriculture has an important part to play in the defense picture—in the military aspect and in all other aspects.

Preparedness is not merely steel and manpower.

Preparedness is also food and fiber.

Neither war nor peace can be won without food and fiber.

American food and fiber are both muscle and hope.

It is the great good fortune of this Nation that we have a strong and healthy agriculture.

Only about one working person out of eight in the United States is actually engaged in farming. The other seven have been released from the need to cultivate the land—released by the productivity of our agriculture for work in manufacturing, mining, transportation and other industries. Our Nation is able to use most of its available manpower to build the tremendous industrial economy which gives us our position of leadership in the world today.

From time to time we have all heard a great deal about the alleged advantage in manpower the Soviet Union and its satellites possess over the United States. In terms of population numbers alone it is perfectly true. The Soviet Union and its puppet states comprise about 800,000,000 persons—about one-third of the population of the entire world. This is immense manpower. It impresses one just by its size—especially when we compare it with our own population of a little over a 150,000,000 persons—or with the 275,000,000 persons in the free nations of Europe. The Communist world outnumbered the United States and free Europe almost two to one.

But the United States and free Europe—though outnumbered two to one—outpro-

duce the Soviet bloc in terms of industrial output by about three to one. We in this country produce about as much industrial output as all the rest of the world combined.

Let us never forget that without an efficient agriculture which has released seven-eighths of our manpower from the need to cultivate the soil, we could not have the industrial or the military might that we possess today.

Nor is this all. The fact that we produce an abundance of food helps to make American labor the most efficient labor in the world. It helps make the American fighting man the best all-around fighting man in the world.

The fact that we produce an abundance of fiber is also vital. This year, as you well know, farmers were asked to increase their acreage of cotton by more than 50 percent—and I want to congratulate farmers and the mobilization committees on the way they went over the top.

There were very good reasons why the Nation needed this big increase in cotton production. Cotton is a war crop. It is used to make light, strong, weather-resistant and water-repellent fabrics, yarns and thread. It is used in airplane and balloon fabrics and parachute cloth. It is used for tenting and for clothing the Armed Forces. And cotton linters are used in making smokeless powder, plastics and photographic film. A bale of cotton linters provides enough smokeless powder for 100,000 rounds of rifle ammunition, over 20,000 rounds of machine gun ammunition, 2,700 antiaircraft shells, or 85 rounds of heavy tank ammunition.

These facts are all part of the whole picture of agriculture's role in defense.

Our agriculture, as I have already said, is strong and productive. Farmers are geared up to the job of producing a good 50 percent more per man-hour than they did before World War II. We are producing this year a third more food and fiber than we did in 1940—with fewer people in agriculture and only about the same acreage in cultivation.

There are a good many reasons behind the ability of our agriculture to produce more. Farmers have put back into their business a large share of the income they have earned in the past 10 years. In 1940 American farmers used about \$5,000,000,000 worth of equipment. This year, they are using \$17,500,000,000 worth of equipment. Even allowing for price increases, agriculture is now using two and a half times as much farm equipment as it did in 1940.

This has a great deal of meaning as a factor in farming efficiency. It means that a man can do his field work when conditions are right. He can finish plowing when otherwise he would be caught by a rainy spell. More often now, he can get the weeds out of the fields before they do too much damage. He can harvest his crops faster and more conveniently.

Another big factor in farming efficiency is the immense progress that has been made in bringing electric power into rural regions. Nearly 9 out of 10 farms throughout the country now have power line service—back in 1935 when the REA was started the reverse was true, nearly 9 out of 10 farms did not have power line service.

In the past few years farmers have improved their buildings and fences. Many have invested in higher quality livestock and in improved varieties of seed. With the aid of the soil conservation programs, many farmers have adopted practices and systems which maintain or improve the soil and increase yields.

Another factor of great importance in today's production is the increased use of fertilizer, and more efficient application of fer-

tilizer. Back in 1940 farmers used about 1,800,000 tons of plant nutrients in the form of commercial fertilizers. This year they are using nearly 5,000,000 tons.

Since the end of World War II, several important new insecticides and other chemicals used in farm production have become generally available.

These are statements that apply to the country as a whole. But I am entirely sincere in saying that I don't think any section of the country has made as much agricultural progress in recent years as the South.

You have diversified your production.

You have expanded your livestock industry.

You have increased mechanization.

You have improved your pastures.

You have proved that the old belief that the South had poor soils is just a myth. On the contrary, given proper nutrients and wisely used, your soils compare very well with those of any part of the country. Corn yields in the South have gone up 75 percent in the past 5 years.

These changes are reflected in the general condition of your agriculture.

The proportion of farms operated by tenant-croppers has sharply declined.

Ownership has increased, and many other farmers who are not owners have become independent tenants.

I venture to say that the greatest gains in the country in the level of living of farm-operators are being made in the South.

The South has used to great advantage the programs for price support, conservation, electrification, and agricultural credit. These programs were brought into existence by cooperation and mutual understanding on the part of people in all walks of life and from all parts of the country.

All this has shown up in the production records that are being established this year. In all sincerity I congratulate the farmers of the South on the very good job they are doing.

Now what does all this progress mean? Does it mean that we can slow up—that we can coast along for a while?

Not if we want to play our full role in the defense of freedom.

This year's farm production is setting a new all-time record. But next year we will want to push the record even higher. I'm talking now about over-all production, not about any one crop.

The Department will do its best to provide the information farmers will need as they plan their operations.

Already we have announced guides for wheat and other fall-seeded crops.

The national wheat goal is a little higher than this year's planted acreage. Although wheat is not one of your big crops, I might mention that in Alabama the goal calls for a 36-percent increase over this year's indicated acreage.

The goal for oats in Alabama calls for an increase of 59 percent over this year's indicated acreage.

For winter vegetables, the national acreage suggested is about 6 percent more than the 1951 acreage.

Goals for spring-seeded crops will be announced later this fall.

To assure adequate supplies of feed grains we have just recently announced a higher level of support price on 1952 crop oats, barley, rye, and grain sorghums.

So the immediate future is not going to relax the pressure on agriculture. On the contrary, the pressure is increasing—and I would say that the pressure on the mobilization committees particularly is going to increase.

Agricultural productivity depends more than ever before on machinery, fuel, rubber,

chemicals, as well as scientific management and skilled manpower. Not much new land is immediately available for economic production. Farm labor is growing scarcer. Most of the supplies and equipment needed are made in part from scarce or critical materials, which are becoming harder to get.

We need adequate supplies of farm machinery, together with essential repair parts to relieve in part the growing manpower shortage. Without the machinery and parts agriculture needs, production would be badly handicapped. We can't go back to horses to take the place of a shortage of tractors or of fuel. First, we don't have the horses, and, second, even if we did, the result would be less production per man and less production for human consumption.

Fortunately, the rate at which farm machinery was produced during the first 6 months of this year set an all-time record. But for the current quarter of the year, production fell to about the level reached in 1949. And in the fourth quarter of this year, we expect a drop to about 80 percent of the 1949 level. On the demand side, according to a recent survey, farmers need 15 percent more new machinery and 20 percent more parts than they received in 1949.

As matters stand right now, farmers in general still seem to have a fairly adequate supply of machinery on hand. But some farmers don't. And some items of farm machinery are scarcer than others, for example, cotton pickers, crawler tractors, and crawler-tractor repair parts.

What worries us, therefore, is not so much the present supply situation as the downward trend in machinery production.

So far as pesticides are concerned, the supply this crop year has been generally adequate. Industry has increased production of preferred types of pesticides this year to about half again as much as last year's production. There were some distribution problems which prevented some farmers getting supplies when they wanted them, but where these problems were brought to attention, measures were taken to meet such scattered shortages.

One of our biggest headaches, however, is the fertilizer situation.

Increased and more efficient use of fertilizer could be a valuable asset in future abundant farm production. As I mentioned earlier, the fact that farmers are using about 5,000,000 tons of plant nutrients this year in the form of commercial fertilizers, compared with about 1,800,000 tons back in 1940, is partly responsible for this year's record farm output.

But though we have greatly increased the use of fertilizers, we need to speed up the rate of increase in the years ahead. We are not using enough fertilizer this year. The Department estimates that the Nation fell 500,000 tons short of the desirable quantity of nitrogen for use in feed grains and pastures this year. Besides this current deficit, we need to add another 100,000 tons of nitrogen a year to take care of our growing population.

We seem to be in a relatively better position to supply potash needs, but supplies of phosphates are expected to decline next year because the sulfur and sulfuric acid needed for superphosphate production are scarce.

We are working on these problems in two principal ways. First, we are pressing hard for increased industrial production of fertilizer materials in order to bring about a better balance between supplies and needs. Second, we are promoting more efficient use of fertilizer materials within agriculture.

It is in this second part of the over-all job that we look to the agricultural mobilization committees to do a bang-up job in the States and counties. That's where it counts. You can do a tremendous service to the cause of freedom and security by carrying out your part of the mobilization task day by day and week by week.

By urging and example you can help farmers to use their equipment and supplies more effectively.

You guide them on production needs and on shifts in production.

You can help them make better use of their grasslands and pastures through the conservation programs and other programs.

You can help them control the enemies that hold back production—whether insects, rodents, disease, fire, accidents, or whatever.

I want to say that the mobilization committees have been doing a grand job.

We deeply appreciate your efforts. We wish we could tell you that you might take a rest now, because, goodness knows, you've earned it. But instead, I must ask you to work at this vital job of agricultural mobilization even harder, longer, more intensely than ever.

I have complete confidence in you. I know that you will continue to do your part.

Death of Sole Surviving Wisconsin Veteran of Civil War

EXTENSION OF REMARKS

OF

HON. ALEXANDER WILEY

OF WISCONSIN

IN THE SENATE OF THE UNITED STATES

Tuesday, October 2, 1951

Mr. WILEY. Mr. President, on Saturday, September 29, the sole surviving veteran of the Civil War in my State, Lansing A. Wilcox, of Cadott, formerly of my county, died in the Grand Army Home for Veterans at King, Wis., at the age of 105.

I could not allow the passing of this fine American to go unremembered without reference to him and to the Grand Army of the Republic. As a young man, I remember seeing him march down the street. As I have said, he lived to be 105. Therefore, I send to the desk a statement which I have prepared on this subject. I ask unanimous consent that it be printed in the Appendix of the Record, along with an article from the Milwaukee Journal giving the history of the GAR in our State and in the Nation.

There being no objection, the statement and article were ordered to be printed in the Record, as follows:

TRIBUTE TO THE MEN IN BLUE (Statement by Senator WILEY)

"Under the sod and dew
Waiting the judgment day
Under the one, the Blue
Under the other, the Gray."

There remain today but five surviving veterans of the epic struggle of 1861-65 between the States of the American Union.

Last Saturday the sixth such survivor passed on to his eternal reward. With the death of Lansing A. Wilcox, of Cadott, Wis., there closed for my State the final chapter in the history of the unforgettable Grand Army of the Republic, a splendid, patriotic organization with which we in Wisconsin have been particularly familiar, based upon the tremendous role played by our Badger veterans in it.

Lansing Wilcox had served as national senior vice commander of the GAR, and for several terms as State commander. In 1949, he attended and participated in a one-man meeting of the GAR in my State.

He was born in Kenosha County on March 8, 1846, and enlisted in the Union Army at 18. He was discharged after 3 years of service. He taught school at Cadott, which is very close to my home of Chippewa Falls, in Chippewa County, and served as postmaster there. We of Wisconsin were mighty proud of this stalwart American.

Today there remain, of course, the various affiliated organizations of the GAR in my State including the Women's Relief Corps, which is the official auxiliary of the GAR, the Sons of Union Veterans, and its auxiliary, the Daughters of Union Veterans, and the Ladies of the GAR.

I should like to point out that it is often difficult for succeeding generations to remember the sacrifices made by those who gave their all in order that this country might endure amidst the great crises of its history. It is comparatively easy for us of 1951 to forget the sacrifices of Gettysburg, or Antietam, or for that matter the sacrifices of San Juan Hill and Belleau Wood. The great events of more recent years live in memory far more easily, and even in those instances, oftentimes we forget what our heroes did for us at Iwo Jima and Normandy. And so as we of Wisconsin honor Lansing Wilcox, we summon up these endearing, inspiring memories. We honor all of the men in Blue who with but five exceptions have now gone on to greater glory. We wish for these remaining veterans and for their survivors many more years of continued life. We pledge to them remembrance of the great deeds which they and their comrades performed. We are grateful indeed for these men in Blue who bequeathed for us a Republic intact and unimpaired.

We of the North honor, too, the heroes in Gray who fought so well, so long, and so devotedly for their convictions and principles. Fortunately, we of America are one today. Fortunately, we have never gone the way of Europe with its divided, quarreling states, and for this we should be eternally thankful.

And so, I say for Wisconsin: Hail and farewell, Lansing Wilcox, God bless and rest your eternal soul. May the ideals of you and your comrades be ever our ideals. May Americans ever be united. May the wounds and scars of disunity be closed forever.

[From the Milwaukee Journal of September 30, 1951]

THE LAST LEAF FALLS, WISCONSIN GAR DEAD—
ONCE VIBRANT FORCE OF CIVIL WAR VETERANS
FADES INTO HISTORY ON DEATH OF WILCOX

"And if I should live to be
The last leaf upon the tree * * *
Let them smile, as I do now
At the old forsaken bough."

—Oliver Wendell Holmes

The last leaf fell Saturday from the gnarled old Grand Army of the Republic in Wisconsin, and with it died the tree.

For the death of 105-year-old Lansing Wilcox, of Cadott—the State's last veteran of the Civil War—knelt the end of Wisconsin's oldest veterans' organization.

Wilcox was the fragile tie to the past, to the days of the boys in blue. His role in the war between the States was minor. It was sufficient that he was in it and out-lived his Wisconsin comrades in arms.

ONLY FIVE LEFT

As long as he lived, the GAR lived. When he died, the colorful, once bolsterous, always patriotic GAR died. The organization lives on in four other States, held together by the existence of five feeble old men whose ages total 629 years.

They are: Douglas T. Story, 106, Los Angeles; William A. Magee, 105, Van Nuys, Calif.; Israel Broadward, 104, Samuels, Idaho; Albert Woolson, 104, Duluth, Minn.; and James A. Hard, 110, Rochester, N. Y.

It was decided at the last Wisconsin GAR encampment in June at Kenosha that the

four allied orders of the GAR would continue in the event of the death of Wilcox.

The groups are the Women's Relief Corps (the official auxiliary of the GAR), the Sons of Union Veterans and its auxiliary, the Daughters of Union Veterans, and the Ladies of the GAR.

REUNION HERE SAVED GAR

When Gen John A Logan, national commander of the GAR, proclaimed the first national Memorial Day in 1868, he wrote:

"Let no vandalism of avarice or neglect, no ravages of time, testify to the present or coming generations that we have forgotten the cost of a free and undivided republic."

Today the ravages of time against which General Logan warned have all but destroyed the great organization of the boys in blue, the army of comrades once more than 400,000 strong.

Wisconsin has long had a special interest in the Grand Army of the Republic. This State was in the vanguard of the organization's founders 85 years ago. A Wisconsin reunion is credited with saving the organization from extinction in 1880, and the city of Milwaukee was the site of great national encampments in 1889 and 1923.

As a national organization the Grand Army of the Republic has now virtually ceased to exist. The last national encampment was held in Indianapolis in 1949, with only six members attending. They ranged in age from 100 to 108. All were deaf; one was blind. Nurses and military police pushed them around the city in wheelchairs. Then they voted to discontinue their national encampments. The man they elected as their final national commander, Theodore A Penland, died September 13, 1950, in Vancouver, Wash. He was 101.

FIRST GAR POST FOUNDED IN 1866

The men of the Union Army formed their first comradeship in battles now famed in American history—Gettysburg, Antietam, Vicksburg—and around "the watch fires of a hundred circling camps" which Julia Ward Howe immortalized in song. The national organization which was to perpetuate this comradeship was founded on April 6, 1866, when a handful of Civil War veterans met at Decatur, Ill., and formed the first post of the Grand Army of the Republic.

The original promoters of the GAR movement were Dr. Benjamin F Stephenson and the Reverend William J Rutledge, surgeon and chaplain of the Fourteenth Illinois Infantry, who had shared a tent during the war.

Wisconsin was quick to join this movement. A soldiers and sailors' league at Madison, headed by Gen James K Proudft, reorganized itself into a GAR post almost immediately after Illinois started the movement rolling. The first Wisconsin GAR encampment was held in Madison June 7, 1866, and Proudft was elected State commander.

STATE LED NATION

The Wisconsin GAR department was actually the first State organization in the Nation. The Illinois department was organized July 12, 1866, more than a month later. However, since the movement originated in Illinois, Wisconsin was content to accept second rank, marching directly behind Illinois in parades.

The Madison GAR post was chartered June 10, 1866. It was named after Cassius Fairchild, a colonel of the Sixteenth Wisconsin Infantry, and later renamed after Lucius Fairchild, a charter member who died in 1896.

The Berlin (Wis.) Post, chartered September 8, 1866, was the only post in the Nation to keep an unbroken record of activity while the other posts were dissolving and reorganizing periodically. For that reason it called itself the oldest post in the Nation.

ONE POST HAD 600 "BOYS"

Other Wisconsin posts organized in 1866, the first year of GAR history, were Ripon, organized June 13; Mazomanie, June 14, Greenbush, June 28; Ahnapec, June 29, and Milwaukee's Phil Sheridan Post, July 31.

Milwaukee posts organized later were named after Gen. John Sedgwick, Robert Mueller, Robert Chivas, E B Wolcott, and George C. Drake. Two other city posts were called the Veteran and Rank and File Posts. The Wolcott Post, organized January 5, was given the coveted No. 1 by the State organization after the older Madison Post had allowed its organization to slump temporarily. The Wolcott Post at its peak had 600 members.

BERLIN POST FORMED CORE OF REVIVAL MOVE

The first 4 years of GAR history were filled with great enthusiasm. In the State of Illinois alone 330 posts were organized before 1870. But this early vigor was followed by a nationwide slump which saw the organization almost disband in its infant years. The period of 1866-77 was marked by an almost complete collapse. In its Illinois birthplace only 25 posts remained on the record books, and only one of these, Rockford, was really active.

Loyal Wisconsin veterans were alarmed by this decline. The slump was dramatized by a State encampment held at Berlin in January 1879 attended by only 3 posts. Collapse of the GAR seemed inevitable.

LETTER SOUNDED RALLY

But the Berlin Post formed the core of a revival movement. The Wisconsin Reunion Association was formed and an all-out effort was begun to revitalize the disbanded army. Letters went out to Union veterans asking them to gather together all their records and reminiscences of the war years and send them to State headquarters. The rallying cry read:

"Comrades, attend to this at once or we shall not know whether you are dead, proud, or gone to Texas."

The association was a smashing success. It organized the great reunion held in Milwaukee June 8, 1880, one of the biggest days in the history of the Civil War veterans' movement.

GENERAL GRANT A GUEST

The 1880 Milwaukee reunion not only revived the GAR and probably saved it from extinction but also earned Milwaukee a great reputation for hospitality. The reunion brought 100,000 people to the 34-year-old city. Neither the hosts nor the guests had seen anything like this tumultuous celebration.

The 40,000 soldiers who attended, many of them not members of the GAR, encamped on North Point, a city of tents situated on what is now Lake Park. The city was elaborately decorated with arches, flags, and miles of bunting.

Gen U S Grant, the ex-President, and Gen Philip H. Sheridan were the honored guests. Old Abe, the famed bald eagle mascot of the Eighth Wisconsin Infantry made one of his last public appearances at the reunion. A huge parade paced by soldiers carrying their tattered battle flags rekindled the old spirit of comradeship. The reunion was called one of the greatest the boys in blue ever had.

IN 1890, ORGANIZATION HAD 409,489 MEMBERS

The Wisconsin revival was repeated all over the Nation. The year 1890 saw the GAR reach its all-time peak, with 409,489 members. (The Union Army had had a total roster of 2,213,365 soldiers. Wisconsin had sent 91,327 men off to fight in the war; 3,801 were killed.)

Milwaukee was also the site for the GAR's national encampment in 1889. Gen. William Tecumseh Sherman made his last visit to the city on that occasion. A mock naval

battle staged on Lake Michigan between the revenue cutters *Michigan* and *Andy Johnson* highlighted the celebration.

The Wisconsin Veterans' Home for Civil War veterans, their wives and widows, was authorized at a State encampment held in Milwaukee in February 1887. The home was founded at the Greenwood Park Hotel near Waupaca and was later deeded to the State.

FAIRCHILD ELECTED IN 1886

The fifty-seventh national encampment of the GAR was also held in Milwaukee on September 2-8, 1923.

Wisconsin's Gen Lucius Fairchild, active in the organization almost from the beginning, was elected national GAR commander in 1886. Fairchild was remembered for a determined fight he waged at the 1890 encampment, insisting that Negro posts be admitted to full fellowship in the GAR.

The influence of the veterans' movement in Wisconsin is shown by the fact that in the 35-year period after the Civil War all but two of the State's Governors were Civil War veterans. They were Fairchild, Washburn, Smith, Rusk, Hoard, Peck, Upham, and Schofield.

DEMOCRACY IN RANKS

Originally the GAR leadership was top-heavy with generals and colonels. An early resolution met this threat to a democratic organization by banning military titles and ordering that all members be known as comrade. An attempt to establish a simple three-rank system within the GAR caused much resentment and was abandoned.

The motto of the GAR was "fraternity, charity, and loyalty." Its uniform was dark blue with a black slouch hat. The official badge was a bronze star hung from a strap and a ribbon flag.

MEMORIAL DAY CONTRIBUTED BY GAR

Memorial Day was one of the GAR's greatest contributions to American traditions. It was founded as a result of a suggestion from a GAR soldier who was a native of Germany. He wrote Commander Logan in 1868 and told him of a German custom "to assemble in the springtime and scatter flowers upon the graves of the dead."

The GAR eagerly took up his suggestion and the day quickly took hold throughout the Nation. The observance was later expanded to include homage to the dead of all the Nation's wars, with veterans of the Spanish-American and World Wars joining in.

TIME TOOK ITS TOLL

By its original articles the GAR was intended to stay aloof from the storms of partisan politics. That was a difficult rule to live up to in a period of turbulent political developments. Many GAR historians speak critically of the GAR sallies into the field of politics from time to time, and most of them blame politics for the various slumps in prestige and membership which the army suffered at times in its long career.

The ravages of time that Commander Logan spoke of were the GAR's greatest enemy, however. From its peak of over 400,000 members in 1890, the organization had slipped to 103,258 by 1920. The average age of its members even then was about 80.

By 1921 Wisconsin had only 2,433 members in 158 posts. This was a sharp drop from the 13,987 members and 264 posts of 1889, the peak year.

From 1920 on, the offensive of time rolled faster. By 1930 the national enrollment had plunged to 21,080. In that 1 year, 6,000 members of the Grand Army of the Republic died.

In 1948 the national membership was down to 47. In 1949 it was 10.

The Grand Army of the Republic is nearing the grave.

But when the soldiers are dead the colors will be carried on by affiliated organizations.

Suppression of Information by Government Agencies

EXTENSION OF REMARKS OF

HON. EDWARD J. THYE

OF MINNESOTA

IN THE SENATE OF THE UNITED STATES

Tuesday, October 2, 1951

Mr. THYE. Mr. President, Members of Congress have viewed with deep concern the announcement by the President of the issuance of an Executive order relating to the classification and release to the public of information by civilian, as well as military, agencies of the Government.

A very significant editorial, citing the dangers in such a restriction of information and possible abuses by bureaucratic agencies, appeared in the Minneapolis Star of last Saturday. It is significant not only because it is the considered editorial opinion of a great newspaper, alert to challenges to a free press and to the American principle that the people are entitled to know what transpires within their Government, but also because it was written by Mr. Nat S. Finney, editorial editor of the Star.

When he was Washington correspondent of the Minneapolis Star and Tribune, in 1947, Mr. Finney wrote a series of articles exposing a similar attempt by the administration to impose controls over the free flow of Government information. For his work in this connection Mr. Finney was awarded a Pulitzer prize in journalism, and he also received the Raymond Clapper award.

I ask unanimous consent that the editorial from the Minneapolis Star of September 21, 1951, entitled "Security Sickness Attacks Again," be printed in the Appendix of the Record.

There being no objection, the editorial was ordered to be printed in the Record, as follows:

SECURITY SICKNESS ATTACKS AGAIN

Unless the press of the country again stops him, President Harry S. Truman will on October 25 institute throughout the Federal Government a system of suppressing information which was considered necessary only in the military departments until 2 years after World War II.

The system Mr. Truman has announced he will impose is military in origin. It calls for classifying certain information, at the discretion of Government officials, as top secret, secret, confidential, and restricted and imposing the heavy penalties of the Espionage Act upon any Government employee who discloses such information without authorization.

Now, as in October of 1947, the justification offered for using this system throughout all executive departments is that they must occasionally handle classified documents from the State and Defense Departments and the Atomic Energy Commission, and must, therefore, have the same secrecy apparatus employed in these so-called sensitive departments.

Plans to institute the system were discovered in the Veterans' Administration in 1947 when that agency mistook a recommendation of the Security Committee of the State and Defense Departments for a directive and prematurely appointed a security officer and drew up regulations for the classification of information.

SWEEPING DEFINITION

The VA's definition of confidential information is worth repeating now because it recalls the spirit in which these regulations were then approached.

Confidential information was described as information the unauthorized disclosure of which, although not endangering the national security, would be prejudicial to the interests or prestige of the Nation, any governmental activity, or an individual; or would cause administrative embarrassment or difficulty.

The point should be made that the document from which these words were taken in October 1947 was itself classified as restricted, and that getting a copy of it required devious methods. It should be noted that then, as now, the Federal classification system promulgated by the White House describes minimum requirements, and leaves departmental regulations to the discretion of the departments.

Congress, alerted by an aroused American press, subpoenaed executive department officials and documents, and the entire official version of the plan was exposed. It thereafter became dormant, but the executive order under which it was drafted was not rescinded and Mr. Truman, far from acknowledging error, castigated the press for its criticism of the plan.

OPEN DOOR FOR ABUSES

Despite the careful assurances issued by the White House about the nature of the system now proposed, there is no substantial reason to believe it differs in any important respect from the one put forward in 1947. It is inherent in the nature of the system that it must be the same, and that it will contain all the abuses that are tolerated in the military departments because lives can be endangered there by leaks of information.

The essence of the system from the public's point of view is that it empowers officials in the executive departments—often very minor civil servants with no political responsibility—to determine what the public shall be told about what the Government is doing.

There should be no mistake about this, and no wavering confusion. The power to decide what the public shall be told is absolute and unlimited because officials of the executive departments will have complete power to prevent the public from learning what is being kept secret.

It is inherent in this system that no independent review can be had of how the unlimited discretion of officials is used or abused unless the system itself is broken down by Congress or by newspapermen willing to attract secret Government documents and brave the consequences.

The press and the public will be best advised not to place too great reliance in Congress for preventing the abuse of such a system. Congress itself now conducts a major share of its important business in secrecy of one form or another.

IS ALL THIS CALLED FOR?

Is the nature of the world situation such that wholesale subversion of the public's simple right to know what Government is doing is justified? The arguments that it is do not carry conviction.

It has been argued that the Federal Government stands in constant danger of being penetrated, and that this justifies the classification system. The argument is nonsense. If a Dr. Klaus Fuchs penetrates a Government department, the classification system will no more hinder than help him in his work.

Security of information invariably depends upon the reliability of personnel, and the classification system invites spies to place themselves at the defined crossroads of the

traffic in secret information, just as Fuchs placed himself.

Does the system tend to reduce negligence in the handling of secret information? Does it induce security consciousness? These questions have been argued up one side and down the other, and the inevitable conclusion seems to be that a classification system clogs communication to such an extent that the mathematics of probability are against both as much knowledge or as much disclosure. But there is no assurance that leaks of important information will be reduced by impeding the whole flow.

Why, then, adopt the system? Have there been any leaks recently that make it urgent that the executive departments decide what the public shall be told?

In the face of such a lock-up of information, the public might be forgiven for concluding there is some connection between it and the innumerable investigations in the current Democratic Congress. Many of these probes were prompted by unauthorized disclosure of information that led to administrative embarrassment and difficulty; and certainly these disclosures are not increasing our prestige abroad. But no one who understands the spirit behind official determination to adopt the classification system in all departments believes this uncharitable view is by any means the whole picture.

SOURCE OF THE SICKNESS

This stubborn insistence that the public business be conducted in private comes from a coterie of quite able public servants who believe the burden of continuous responsiveness to popular reaction to official acts is intolerable. These men—and any savvy Washington correspondent can name them—conspicuously lack the indispensable capacity of a politician to suffer fools gladly, and they almost visibly wince when required to face the great beast in all its (the people's) whimsicality.

These are men who have formed their executive habits in one of two traditions, each great but neither an adequate preparation in politics. One is the military tradition; the other is big business. Both permit arm-length relations with the public.

These gentlemen—and the word fits them in almost every sense—make vocal and persuasive a more subtle inclination of big government toward secrecy. The incredible growth of government's power has tended to make some government officials the spoiled children of power in much the same way that excessive concentration of economic power spoiled its possessors two generations ago. It is hard to put your finger on it, for the defensive instincts of the political animal are still very strong. But the truth is that big government, like big business, fosters the spirit of the public be damned.

Admission of Spain to the North Atlantic Treaty Association

EXTENSION OF REMARKS OF

HON. HERBERT R. O'CONOR

OF MARYLAND

IN THE SENATE OF THE UNITED STATES

Tuesday, October 2, 1951

Mr. O'CONOR. Mr. President, in attempting to enlist the aid of all friendly nations, in the world-wide effort to curb communism, I think it particularly important that we have the great advantages which are available through the cooperation of Spain as a member of the North Atlantic Treaty Association. An

editorial on this subject was published in the Baltimore News-Post, and I ask unanimous consent to have it printed in the Record.

There being no objection, the editorial was ordered to be printed in the Record, as follows:

LET SPAIN IN, TOO

The admission of Greece and Turkey to membership in the North Atlantic Treaty Organization makes the whole western world stronger, and thus safer.

It can be made still stronger and safer by similar action in the case of Spain.

All three of these vigorous nations have traditions and a heritage of sovereignty and independence.

They have opposed and resisted communism longer and more successfully than most of the rest of the world.

They are more gravely menaced by communism than most of the other free nations. They are relatively strong in a military sense, and they are genuinely friendly to the Western Powers and they would be loyal and valuable and probably indispensable allies in the event of a general war against the Communist world.

So it has been a mistake to isolate any of these friendly nations, as the North Atlantic Treaty Organization has done in the case of Greece and Turkey, and it is a sound decision which now remedies that mistake.

But it is a greater mistake to continue the ostracism of Spain, and the strength and security of the western nations will never be fully assured until that mistake is similarly repaired.

Political Influence in Loans by the Reconstruction Finance Corporation

EXTENSION OF REMARKS OF

HON. J. ALLEN FREAR, JR.

OF DELAWARE

IN THE SENATE OF THE UNITED STATES

Tuesday, October 2, 1951

Mr. FREAR. Mr. President, I ask unanimous consent that there be printed in the Appendix of the Record the Washington Report, by Bascom N. Timmons, the correspondent of the News-Journal Washington bureau, published in the Journal Every Evening of Wilmington, Del., on September 28, 1951.

There being no objection, the article was ordered to be printed in the Record, as follows:

WASHINGTON REPORT

(By Bascom N. Timmons)

WASHINGTON, September 28.—That hot water in which both Democratic National Chairman William M. Boyle and Republican National Chairman Guy George Gabrielson find themselves as a result of their alleged efforts on behalf of RFC loan applicants was brought to the boiling point largely through the efforts of one man.

He is Senator JOHN J. WILLIAMS, Republican, of Delaware.

Senator WILLIAMS surprised a number of persons when he took to the floor of the Senate to make public the fact that the chairman of his own party had been taking \$15,000 a year from a firm that has received an RFC loan and has been trying to get more favorable terms on repaying it.

The action of the Delaware Senator did not surprise those who know him, however, for

he has established an enviable reputation for integrity and for complete fairness. He voiced his own credo when he told the Senate that having initiated the criticism of Mr. Boyle for activities on behalf of an RFC loan applicant, he would insist that the same standard be applied to his own party and to its officials.

It is an interesting story as to how the Delaware Senator got Boyle onto the Washington hot-seat now shared by Gabrielson. Only because of Senator WILLIAMS' insistence that all aspects of the affairs of James P. Finnegan be investigated did Boyle and the American Lithofold Corp. hit the headlines.

Finnegan is the former collector of internal revenue in St. Louis. WILLIAMS, a member of the Senate Finance Committee, has been insisting that improper activities on the part of politically-appointed tax collectors be investigated. Early in the probe, the finger of suspicion pointed at certain activities in which Finnegan had been engaged. Finnegan abruptly resigned his job when the heat began to come on.

Shortly thereafter he was cleared by a Federal grand jury, but Senator WILLIAMS charged that certain derogatory reports on Finnegan's conduct had been withheld from that grand jury. Federal Judge George Moore, of St. Louis, immediately impaneled a new grand jury and when WILLIAMS read in the Senate the file and docket numbers of certain field reports from internal revenue intelligence agents, the grand jury renewed its probe of Finnegan.

One of those reports that had been lost somewhere in Washington detailed Finnegan's connection with American Lithofold, a printing firm from whom he had been getting legal fees. Investigation by the grand jury and by the St. Louis Post-Dispatch then turned up the fact that an attorney named William Boyle had shared in those legal fees and that Mr. Boyle was the one and same who is national chairman of the Democratic Party. The fact that date of the fees to Finnegan and Boyle coincided with granting of an RFC loan to the printing firm has attracted the interest of Senate investigators.

Had not Senator WILLIAMS persisted in demanding a full probe of Mr. Finnegan's business activities, the story might never have been disclosed. As it is, the investigation of American Lithofold is turning up a lot more evidence, including a story of gift cameras to White House Secretary Matthew J. Connolly and others.

Meanwhile, Senator WILLIAMS has demanded to know who was responsible for suppressing the incriminating report about Mr. Finnegan that touched off all the fireworks. He has never had a clear answer. The Federal district attorney for St. Louis, Drake Watson, and the Commissioner of the Bureau of Internal Revenue, George J. Schoeneman, have both resigned.

The story of intrigue may get deeper, but the man behind the eruption of Washington's newest and most sensational scandal, involving the heads of both political parties, is staying quietly in the background.

Senator WILLIAMS is an unassuming man who does not seek the limelight. A small town feed merchant in private life, he never participated in politics before his election to the Senate in 1946.

Delaware is probably one of the few States where a small-business man can be elected directly from private life to the Senate. WILLIAMS shies away from the spotlight, refuses to appear on radio or television programs, and will not write any books or magazine articles about his investigations.

The Delaware Senator displays a rare quality of modesty, integrity, and impartiality that are like a fresh breath of air on the Washington scene. He may not get much glory for the job he has been doing, but he deserves some credit.

The St. Lawrence Seaway

EXTENSION OF REMARKS OF

HON. HERBERT H. LEHMAN

OF NEW YORK

IN THE SENATE OF THE UNITED STATES

Tuesday, October 2, 1951

Mr. LEHMAN. Mr. President, in the light of the widespread interest expressed in the recent announcement that Canada might undertake the seaway alone unless we hurry and pass the necessary legislation, I think an editorial in yesterday's Washington Post might well be of general interest. I ask that this editorial entitled "St. Lawrence Seaway" be printed in the Appendix of the Record.

There being no objection, the editorial was ordered to be printed in the Record, as follows:

ST. LAWRENCE SEAWAY

President Truman and Prime Minister St. Laurent, of Canada, have put Congress in an embarrassing position with regard to the St. Lawrence project. Only 2 months ago the House Public Works Committee laid aside a measure authorizing United States participation in the construction of the long-awaited seaway connecting the Great Lakes with the Atlantic. In the hearings and discussion that preceded the vote it was frequently forecast that Canada would go ahead with the project alone if the United States was not ready to carry out its agreement of 10 years ago. That warning was generally shrugged off as propaganda. Now Mr. St. Laurent has removed all doubt as to what his administration intends, and Mr. Truman has given his blessing to an all-Canadian seaway in the event that Congress continues to balk. As the channel proposed by Mr. St. Laurent would be built on the Canadian side of the river, it is assumed that no consent on the part of the United States would be required.

If Canada thus decides to go it alone, Americans will probably pay the lion's share of the cost without acquiring the advantages of joint ownership and control. Shipping on the St. Lawrence is predominantly in the hands of United States interests and will doubtless continue to be so. The importance of this shipping is being enhanced by the opening of vast iron ore deposits in Labrador and northern Quebec to supply steel mills in or near the Great Lakes cities. American interests might be left at a serious disadvantage if Canada, having put up the money and done the work, should exercise complete control over the fixing of rates on the waterway. The St. Lawrence might even become a bone of contention between the two countries instead of a bond of common interest between them.

The understanding reached between the President and Prime Minister St. Laurent is to the effect that the two countries would proceed jointly in development of a \$400,000,000 hydroelectric power project near Massena, N. Y., even if the channel for oceangoing vessels should become a Canadian project. New York State is eager to go ahead with the power development regardless of the outcome of the seaway proposal. Congress could not stand in the way of such an arrangement without assuming a dog-in-the-manger attitude.

In our opinion, Congress ought to resurvey the entire project with less of the sectionalism that has so strongly influenced opinions in the past. Apparently a channel for

oceangoing vessels will link Detroit to the Atlantic a few years hence with or without the approval of Congress. Pressure would then be strong for a deep channel linking Lakes Superior, Michigan, and Huron to the seaway. The most practical course is to plan now for the entire undertaking with the United States and Canada sharing the responsibility, the costs and the benefits.

If Theodore Roosevelt Were Acting in Behalf of William Oatis

EXTENSION OF REMARKS OF

HON. JOHN V. BEAMER

OF INDIANA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. BEAMER. Mr. Speaker, there are many people in this country who feel that its past history can be studied to advantage in light of some of the present day's occurrences. This letter from William Loeb, editor, Manchester Union-Leader, New Hampshire, is an excellent illustration.

Under unanimous consent, I insert the letter in the RECORD:

SEPTEMBER 24, 1951.

Congressman JOHN V. BEAMER,
House Office Building,
Washington, D C

DEAR CONGRESSMAN BEAMER: Looking over the letter of mine which you so kindly inserted in the CONGRESSIONAL RECORD, along with the editorial, brought to mind another incident, the inside story of which you might enjoy. It concerns the time the Kaiser sent the German fleet over to the coast of Venezuela to collect some debts owed by Venezuela to various German nationals. The American reaction to this violation of the Monroe Doctrine of that day was as follows:

Back at the turn of the century when my father was a young man, he served as chief private secretary to Theodore Roosevelt at the time he was President of the United States. One day the President sent him to call on German Ambassador "Speck" von Sternberg.

My father said, "President Roosevelt has asked me to call your attention, Mr. Ambassador, to the fact that the German fleet is in Venezuelan territorial waters, contrary to the Monroe Doctrine. The President further asked me to inform you that you request your Government to remove the fleet within 24 hours' time."

Some 16 hours later my father returned to the German Embassy and told the Ambassador the White House had been informed that the German fleet was still in Venezuelan territorial waters and that no message had been received by the State Department or the White House as to the future movement of the fleet.

To which von Sternberg replied, "Surely you were not serious in bringing the message from the President. It would be worth my diplomatic career to convey such a message to the all highest. Yours is a fine country, Mr. Secretary, but, after all, I represent His Imperial Highness and the German Empire. Furthermore, your own father, Mr. Secretary, came from Germany. We are good friends. I gave your son, Billy, a large christening cup when he was born. Surely we can settle this matter."

To this my father replied, "I am sorry, Mr. Ambassador. It is true that my father came from Germany and we have many ties

with the old country. But you must remember that our family left Germany for one reason—we preferred freedom.

"Besides, President Theodore Roosevelt is one who, once his mind is made up, is not swayed from acting in accordance with his firm principles.

"The President has instructed me to tell you further that, since we have had no reply at all in the 16 hours, we have no intention of waiting the remaining 8 hours.

"The Atlantic Fleet, under Admiral Dewey, is at Guantanamo Bay in Cuba. President Roosevelt, early in the day, ordered Admiral Dewey to get steam up and strip his ships for action.

"If no word is forthcoming from your Government inside of 4 hours, the President will order Admiral Dewey to set sail for Venezuela immediately to take whatever action is necessary."

With that, my father withdrew from the German Embassy.

In about 2½ hours, the American minister to Venezuela reported that the German fleet had pulled up anchor and was moving out to sea.

I thought this story might be of interest to you, in contrast to what happens nowadays. This story is a bit of unpublished history.

Usual regards and best wishes.

Very sincerely,

WILLIAM LOEB,
President.

Income Tax on Rural Electric Cooperatives

EXTENSION OF REMARKS OF

HON. KARL M. LECOMPTE

OF IOWA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. LECOMPTE. Mr. Speaker, the Iowa Rural Electric Cooperative Association has made great strides in providing farm families throughout the State with electricity. During World War II and since then our farms have produced more than ever before, and the splendid record is partially accounted for by the fact that more and more of our farms now have electricity. At a meeting of the Iowa Rural Electric Cooperative Association last week a resolution was adopted opposing any change in the tax regulations with respect to cooperatives, and I wish to bring this resolution to the attention of all Members of Congress. Under leave to extend my remarks in the RECORD, I include this resolution:

IOWA RURAL ELECTRIC

COOPERATIVE ASSOCIATION,

Des Moines, Iowa, September 24, 1951.

HON. KARL M. LECOMPTE,

House Building Office,

Washington, D C.

DEAR MR. LECOMPTE: At the annual meeting of the Iowa Rural Electric Cooperative Association last week, the following resolution was unanimously adopted:

"Whereas there have been recent proposals affecting the income tax status of cooperatives; and

"Whereas cooperatives now complying with the requirements of the Federal laws and regulations have no taxable income, but rather contribution to capital through price adjustments; and

"Whereas the changing of tax treatment of contribution to capital by patrons will cripple the established financial plans of cooperatives, many to the point of financial ruin: Now, therefore, be it

"Resolved, That the Iowa Rural Electric Cooperative Association express its unqualified opposition to any change of the existing Federal laws and regulations with respect to the income-tax status of cooperatives, and be it

"Resolved, That a copy of this resolution be forwarded to each Senator and Congressman from Iowa."

Please consider this.

Very truly yours,

WM. H. WISDOM,
Acting Executive Secretary.

Victory for the South

EXTENSION OF REMARKS OF

HON. FRANK E. SMITH

OF MISSISSIPPI

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. SMITH of Mississippi. Mr. Speaker, under unanimous consent, I include the following editorial from the Memphis Commercial Appeal:

VICTORY FOR THE SOUTH

Thanks to the fairness and courage of the people of Indianola and Sunflower County, Miss., a victory of incalculable value to the South has been achieved. It is a victory of decency over brutality—of honesty over the most vicious sort of wrongdoing and fraud. It is a grim warning that the old-fashioned and outrageous theory of law enforcement that "anything for sake of a conviction is all right" has no place in modern, enlightened society, and particularly in the South.

The victory was symbolized by the sentencing of two white men for beating four Negroes so severely that they confessed to a "murder" which hadn't been committed. One was a deputy sheriff and the other a self-styled private detective later revealed to be an Illinois probation violator. He had been hired by a sheriff too busy to do his own investigating. The now-dismissed deputy was in charge of the jail where the four innocent Negroes were imprisoned and beaten until they "confessed."

Both assailants pleaded guilty to four charges of assault and battery. The sentences imposed are the maximum permitted—6 months imprisonment and a \$500 fine. They should be compelled to serve every day and pay every dollar.

The Commercial Appeal is proud of the part it played in bringing their outrage to the attention of Mississippi's people but infinitely more proud of the manner in which, from Governor Wright down, the people reacted to their sense of great indignation. Especially are we gratified by the response which came from the citizens of Indianola and Sunflower County. They and their prosecutive and judicial processes are responsible for the outcome. They even provided for the employment of a special prosecutor to assist District Attorney Sanders. They were determined that there would be atonement to outraged justice and their will has prevailed. Every honest law-enforcement officer in the South will rejoice that it is so.

The two guilty assailants violated not only the constitutional rights of those they so falsely accused but their every action was repugnant to honest citizens in whose service they were sworn. Theirs was a crime

against law enforcement itself as well as against individuals.

The victims were of humble background but far from friendless for as their friends and as their champions, their State and all its good people stood forth. Let the memory of that spectacle be engraved in the minds of those who so readily and blatantly speak ill of Southern justice. Here was true Southern justice.

Federal proceedings against the discredited and imprisoned officers impend but whatever their outcome it is the lesson of local handling of local problems—of local justice prevailing to rectify a terrible wrong that it is so impressive and so expressive of the goodness of the people of Mississippi as this newspaper has known and recorded it for more than 100 years.

Legislation Affecting the Postal Service

EXTENSION OF REMARKS

OF

HON. GARDNER R. WITHROW

OF WISCONSIN

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. WITHROW. Mr. Speaker, under unanimous consent to extend my remarks in the RECORD, I include therein portions of the testimony of President William M. Thomas, of the National Postal Transport Association, before the Senate subcommittee considering S. 861.

I have introduced in the House a companion bill, H. R. 2331. We who are supporting these measures hope that soon after the convening of Congress in January, a thorough hearing will be held by the Post Office and Civil Service Committee of the House. I have asked for this unanimous consent in order that the Members of the Senate and the House might have an opportunity to acquaint themselves with the importance of this legislation. President Thomas, in his very excellent testimony, sets forth the facts and the necessity for the passage of this legislation. I hope that all Members of the Senate and the House will go over the testimony given by Mr. Thomas thoroughly:

STATEMENT OF W. M. THOMAS, PRESIDENT, NATIONAL POSTAL TRANSPORT ASSOCIATION, RELATIVE TO S. 861

Mr. Chairman and members of the subcommittee, my name is W. M. Thomas, president of the National Postal Transport Association, and represent approximately 27,000 postal transportation clerks. These clerks are engaged in the arduous and exacting duties of distributing and expediting transient mails moving over the rail and airlines of the Nation.

The need for mileage legislation as proposed by S. 861 can best be explained by stating that as early as 1936 the Post Office Department recognized the necessity for a speed differential in order to protect working assignments of postal clerks performing service in railway post office cars on the vast railroad systems that comprise the backbone of the postal transportation system.

Under date of May 25, 1936, the Post Office Department issued Circular Letter No. 4283, which provided that postal clerks assigned to duty in high-speed trains would be allowed a time credit of 8 minutes per mile when the average speed of the train exceeded

45 miles per hour, but not to exceed 60 miles per hour. In 1946 this time credit for speed was further liberalized by allowing credits to begin when the average speed of the train exceeded 42.49 miles per hour.

During the latter part of 1949 the Post Office Department notified the officers of the National Postal Transport Association that it would decline to continue the speed credits beyond July 1, 1950, without legislative authority from the Congress. At this time we seek such legislation.

In substance, S. 861 will give to the Post Office Department legal authority to grant speed credits which heretofore have been granted by administrative action.

A postal transportation clerk assigned to duty in a railway post office car has one of the most unique occupations in the world. He spends long hours of continuous duty, standing on the floor of a swiftly moving mail car, both day and night. Meals and sleep are irregular. The correct dispatch of the mail from the ever-varying standpoints of the trains of the postal transportation service demands expert knowledge and alert minds on the part of postal transportation clerks, which they attain only through long training and constant study. It must be remembered that the train is constantly moving, requiring instant knowledge of different connections covering thousands of post offices. The development of this system of distribution while mails are in transit is the only means by which mail matter can be kept moving constantly until it reaches its destination. Advantage is taken of the best available connections, even to the ultimate in connections where mail is dispatched from one train to another train at a station where neither train stops. It is easy to visualize the delay if all the mail were sent to a central distributing point. The postal transportation service has thus earned by its efficiency the nickname "backbone of the postal service."

The needs of this type of service prevent a normal work day. Train services and schedules dictate completely the working hours of clerks. The clerks are as dependent on the railroad schedule as is any engineer or fireman, and yet he is responsible only to the Post Office Department and the public. Thus, clerks are required to be on duty consecutive hours often much longer than the normal day's work, and they are, therefore, given compensatory time off on another day so that their average day approximates a normal work day.

The service of the individual postal transportation clerk has thus been standardized, to a certain extent, to be a period of time on duty and a period of time off duty. It is easy to understand that if a clerk were to work 20 hours a day for 2 days, he would have the same amount of time on duty as another clerk who worked 8 hours a day for 5 days. So the system of computation as to the number of trips a clerk per year consists merely of dividing the number of work-minutes per trip into the number of work-minutes per year, and the result is the number of trips the clerk shall be required to make per year. The number of these trips can be anywhere from 50 to a few hundred per annum, depending on the number of minutes per trip. It has become the custom to assign the individual clerk his trips in a regular cycle or tour of duty. Thus, a clerk may make one trip in 2 days, and have the next 2 days off duty. Or he can be assigned to make three trips in 6 days and have the next 6 days off duty.

The individual clerk, therefore, has to adjust himself to work a period of from 2 to 6 days away from home and a comparable rest period at home.

A postal transportation clerk assigned to duty on a high-speed train should have special consideration. The Honorable (then Senator) James M. Meade recognized this

fact on July 11, 1935, when he wrote the then Postmaster General, Hon. James A. Farley, as follows:

"MY DEAR JIM: I was glad to have your letter and a copy of your communication addressed to Senator McKellar in reference to H. R. 6990, known as the 40-hour-week bill. Recommendations pertaining to custodial and other employees will be readily agreed to, but I believe we will do a great injury to the employees of the Railway Mail Service if we eliminate the mileage feature from the bill.

"If labor is to receive any benefits resulting from the increased speed of our mail trains it must result from the adoption of a system giving remuneration for a certain number of hours or a certain number of miles, both factors being interchangeable. This principle is based on the sound theory that the faster a train moves the greater the hazard, the exertion, the responsibility, and likewise the greater becomes the amount and volume of production.

"The hour and mileage system has been in operation on our railroads for many years. It was recognized officially during the administration of former President Woodrow Wilson, and it is likewise recognized at the present time under the administration of the Railroad Coordinator. It is to my mind the best system of automatic compensation for technological displacements of manpower that has yet been formulated.

"Unless we adopt an hour and mileage system, with the coming of the Zephyrs and other fast trains many of our railway-mail clerks will be automatically penalized, and only the Department will benefit by this latest development in railroad transportation.

"A readjustment of schedules and the lengthening of advanced time periods will provide ample means for the Department to exercise fair and reasonable control over the employees of this service.

"I trust, therefore, that it will be possible for us to work out a fair hour and mileage provision, and assuring you of my willingness to cooperate at all time, I am, with best wishes,

"Very sincerely,

"JAMES M. MEAD."

The Honorable Senator Mead stated that the faster a train moves, the greater the hazard, the exertion, the responsibility, and likewise the greater becomes the amount and volume of production.

That the hazard is greater is easy to understand. Injuries frequently occur. Files of the Bureau of Employees' Compensation, Federal Security Agency, show many instances caused by a violent "lurch of the train."

Injuries caused by loss of balance because the train lurched are not the only hazards that are multiplied by high-speed operation of the trains. Wrecks, even though they are infrequent, are exceptionally dangerous to the postal-transportation clerks, because of the operation of the railway post office car very near the engine. The higher the speed of the train when a wreck occurs, the less are the clerks' chances of survival. Whether there is more likelihood of a wreck occurring in a high-speed train can be debated; but if the wreck occurs it is infinitely more dangerous in a high-speed train.

Exertion, as Senator Mead suggested, is another definite factor that increases in direct proportion to the speed of the train. As mentioned above, there are three distinct motions to the floor of the post-office car, in addition to the forward motion. These motions, side to side, up to down, and front to back, and combinations of these motions, make it very difficult for anyone to maintain a stable footing. Passengers, when walking from one end of a moving passenger coach to the other end, will hold to backs of seats to balance themselves. The postal transportation clerks, on the other hand, cannot hold

to anything, as both hands are occupied with their work. Thus they must not only maintain balance, but must maintain full production simultaneously. Distribution of mail on a speeding train is one of the most strenuous occupations.

The third point mentioned by Senator Mead is responsibility. A postal transportation clerk is responsible not only for the safety of the mail matter in his custody, but for the proper distribution and correct dispatch of the mails. In order to insure the correct dispatch, it is necessary for the clerks to have instantaneous knowledge of the location and train or other connection for each and every post office in several States. This requires intense study and prodigious memory. The post offices in any one State may number from a few hundred to several thousand, and the connections are continually changing. Each time a railroad changes time on any train, a number of connections are affected. The postal transportation clerk must know all this information, as on a high-speed train he has no time to look up an office or a connection. Clerks assigned to high-speed trains realize they have less time to complete their duties and thus put forth every possible effort to complete distribution on time. It is a spirit of honor and service that has grown up through long years, and the pride of workmanship and loyalty to duty.

The inequities arising out of employment on fast trains may be illustrated by the following example. Suppose a clerk lives in Chicago and is assigned to round trips between Chicago and St. Paul, Minn. The distance between these points is 410 miles. The clerk works 1 day running to St. Paul, spends the night there, and works the next day on the return run from St. Paul to Chicago. He is thus away from home 2 full days. Suppose the hours of duty on a slow train were 26. If that train were speeded up to make the run in 5 hours less time each way, his total hours of duty would be reduced to 16, but it would still require him to be away from home 2 days to make the trip. With no speed differential, it is necessary for him to make a much greater number of trips each year to complete his maximum annual hourly requirements at straight time. Clerks must spend substantial periods of time in home work, as is recognized in the present law by the allowance for lay-off periods of 50 minutes per day for class A and 1 hour and 35 minutes per day for class B. But in the nature of the situation, the clerk cannot carry with him his files, data, and written materials necessary for this work; he can complete these home duties only at his home. Thus a clerk assigned to work on a fast train who received no concessions because of any speed differential would have to work much harder to fulfill his annual requirements at straight time than would be the case if he worked on a slow train. In the example given above, a clerk running from Chicago to St. Paul, on the slow set of trains taking 26 hours for the round trip would make 62 round trips per year, 62 nights away from home, 124 days of 13 hours each on duty, but the clerk assigned to the set of fast trains would make 101 trips, 101 nights away from home, 202 days of 8 hours each on duty. And the clerk on the fast set of trains needs more time to recuperate, because of the added physical and mental strains.

The Government recognized and enforced certain rules governing the services of railroad employees during the period of Government operation of the railroads. The conditions affecting the postal transportation clerks are identical to those under which the railroad employees work, though the Government does not provide as favorable hours of service as that in effect in railroad services. Congress has enacted laws for a mileage limitation in the railroad service. The Na-

tional Postal Transport Association is now asking for the recognition of a similar factor for postal transportation clerks. It is fundamental and necessary, and more so now, in these days of faster schedules. The controlling factors in railroad service were set by the Railroad Administration in approving standards in effect at that time. The Railroad Administration said that 150 miles or less (a minimum of 135 miles) should be a day's work and carry a day's pay. Anything in excess of 7 hours 30 minutes should be paid as overtime, or if on a speed basis of 20 miles per hour. Thus the annual mileage requirements in railroad service are 54,750 miles maximum for base pay. Without the protection of such a law, there are many instances of postal transportation clerks traveling well in excess of 100,000 miles per year to fulfill their minimum requirements.

Legislation is needed to give credit to postal transportation clerks for miles or hours on duty. The factors must be interchangeable, because not all the time a clerk is on duty is spent en route. Advance time consists of time spent in the depot before the train departs, at work, both in preparation of the railway post-office car for the trip and in some distribution. Under varying conditions, the advance time may be as little as no time at all, to as much as 5 or 6 hours. The advance time is based, not only on the amount of time the car is available, but also on the amount of time necessary to prepare for the trip and the volume of mail available to be distributed before the train leaves. Advance time is necessary—a much larger crew would be needed if utilization were not made of the advance time available. Also, the clerks are not released from duty, as is the railroad crew, immediately upon arrival at the terminus of the run. They are required to remain in the post-office car until all mail is unloaded, and certain crew members must convey the registered mail to a post office or other designated point.

It is therefore evident that some provision is necessary to protect this branch of the Government service which has been conceded to be the backbone of the postal service, for without proper transportation facilities and proper distribution of mail en route, the entire postal service deteriorates and the delivery of mails is retarded. The worker should not be expected to bear additional burdens on account of these faster train schedules which are being placed in operation. These additional burdens can only be avoided by legislation adopting a speed credit, as provided in S. 861.

Time credits as provided for in the bills under consideration are comparable to those granted administratively for 14 years. In effect such credits would freeze the number of round trips required, once the speed of 42 miles per hour was exceeded. We note that the Department's report states that such legislation would result in personnel problems for the reason that it would grant shorter hours of employment to some clerks. In connection with this statement it should be pointed out that no such morale problems resulted from the operation of the administrative time credits during the entire period of 14 years it was effective.

Time schedules of runs, plus additional requirements for advance distribution and unloading, results in a situation where it is not possible to organize all clerks on a full 8-hour-day basis. Often these clerks are a few minutes a day deficient in time and such deficiencies are cumulative for the period of the fiscal year. It will be seen that during the period from July 1 to December 15 a considerable amount of time deficiency can accumulate against the record of a clerk. The heavy flow of mails during the Christmas season cannot be distributed by regular authorized crews and it becomes necessary

that the crews be informed, resulting in additional trips for the clerks. Often all time credits so earned are entirely absorbed in satisfying deficiencies which have accumulated and the clerks cannot be paid any overtime for the trips made. Thus it will be seen that when employees of private industries are given Christmas bonuses by their employers, and are often granted time off, even in addition to the legal holiday, postal transportation clerks assigned to road duty are required to work additional hours and without additional compensation. Such a condition does not exist in any other branch of the Government service and would surely not be tolerated in private industries. Thus the need for enactment of the last proviso of S. 861 which would provide for payment or overtime for any service in addition to that of the regular schedule. I should point out the fact that the enactment of this proviso would continue the present practice of charging time credits resulting from late operations of trains to accumulated deficiencies and that, while railway trainmen operating on trains, the average speed of which exceed 20 miles per hour, do have deficiencies, such deficiencies are canceled at the end of each trip and they cannot be required to perform additional duties as a result.

It is noted that the report of the Postmaster General states that there is no exact figure of cost computed, but estimates the cost at \$750,000 per annum. It is significant that the Seventh Division is used as an example, the cost in that Division being estimated at \$50,000 per annum. I would like to point out that the Seventh Division, comprising roughly the States of Missouri and Kansas, and being in the West, is served by transcontinental trains and has a greater percentage of speed trains than most divisions. In some divisions the cost resulting from time credits would be negligible. If we should use the First Division as an example it is thought that the cost of this item would not exceed \$5,000 per annum. Of the 15 divisions the cost would not be the same in any two, but it is our estimate that the entire cost of providing time credits to clerks performing service on high-speed trains would not exceed \$250,000 per annum. There would be an additional cost resulting from the last proviso of the bill which grants overtime for additional required service without regard to accumulated deficiencies. Again, it is not possible to accurately compute the cost of this proviso since it would depend, to a great extent, on unpredictable late running of trains during the period from July 1 to December 31 of the year, but any additional cost resulting from this item would surely be justified by the fact that, at long last postal transportation clerks assigned to road duty would be given treatment comparable to that given all other Government employees and to employees of private industries.

Finally, it is noted with a great degree of surprise that the report of the Postmaster General appears to be concerned about the morale of employees, since he states that the enactment of this bill could create a morale problem. While we could enumerate other arbitrary acts on the part of the Department during recent years which have had a strong tendency to completely destroy the morale of postal workers, surely there has been none more apparent than the discontinuation of time credits as was provided administratively over a period of 14 years. When we appealed to the Postmaster General that such time credits be continued, he replied under date of June 28, 1950, as follows: "The fact remains that there is no legislative basis for granting employees assigned to road duty a time credit for performing service in high-speed trains." Such time credits were first provided in 1936 at a time when there was no more legislative basis than in 1950. The credits were granted for the reason that the

Department recognized the merits of such an arrangement and such merits are as great, if not greater at this time than in 1936. The fact that officials discarded these benefits without cause destroyed all confidence many employees had in the Department. It appears very unusual that the Postmaster General should express concern in morale at this time. I have been an officer of this association for 16 years, including the entire period of time time credits were allowed, and knew of no morale problems arising as the result. At this time, I advocate enactment of this bill, but surely would oppose any measure which might result in a morale problem.

Mr. Chairman and members of the subcommittee, I deeply appreciate this opportunity of expressing the views of the National Postal Transportation Association relative to S. 861 and most sincerely urge you to give full consideration to the meritorious provisions contained therein.

Statement of Hon. Guy George Gabrielson

EXTENSION OF REMARKS

OF

HON. B. CARROLL REECE

OF TENNESSEE

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. REECE of Tennessee. Mr. Speaker, on Monday, October 1, Chairman Guy George Gabrielson, of the Republican National Committee, made a statement to the executive committee in which he analyzed the operation of the Carthage Hydrocol Corp., of which he is president, and its relationship with the RFC.

The committee was so impressed with Mr. Gabrielson's presentation and the honest, open, and aboveboard manner in which he had handled the company's affairs in connection with the RFC and other departments of the Government which have to do with conserving our natural resources that it unanimously gave him a vote of full confidence.

The statement is of such public interest that I am presenting it for the RECORD, that it may be widely available:

STATEMENT OF CHAIRMAN GUY GEORGE GABRIELSON TO THE EXECUTIVE COMMITTEE AND MEMBERS OF THE REPUBLICAN NATIONAL COMMITTEE FROM 21 STATES AND THE DISTRICT OF COLUMBIA AT THE MAYFLOWER HOTEL, OCTOBER 1, 1951

The purpose of this meeting of the executive committee and members of the National Committee from 21 States and the District of Columbia is to discuss plans for the coming campaign and our National Convention which will convene July 7, 1952, in Chicago.

It is customary and proper for such discussions to be held behind closed doors. Before going into executive session, however, I desire to read a statement and invite your comment and questions on a subject in which we have a mutual interest because of recent statements and headlines.

I am proud to be the president and general counsel of Carthage Hydrocol, Inc., a company organized to make high octane gasoline and chemical byproducts from natural gas by a process which does this at a cost competitive to making gasoline from petroleum.

Some of you know part of the story. I have a neighbor in New Jersey, Mr. P. C. Keith, who is an internationally known

chemist and inventor. During the last war, when it became apparent that the possession of high octane gasoline and its by-products might determine who won that war and future wars, Mr. Keith saw a problem.

He recognized that our petroleum reserves are limited. He also knew that we had a vast supply of natural gas. Just as the inventive genius of the United States developed synthetic rubber when the Japanese cut off our supply of natural rubber, Mr. Keith applied himself to the problem of making gasoline from dry gas. He found the answer in an adaptation of Germany's famed Fischer-Tropsch synthesis from coal.

Mr. Keith obtained private financing to construct a pilot plant which proved his process. He then went to Mr. Jesse Jones, who was head of the Reconstruction Finance Corporation, to see whether the Government of the United States would be interested in assisting in the development of a new industry which would contribute not only to the national defense, but to the utilization of a vital natural resource.

I have been asked why Mr. Keith went to the Government. He had two reasons. Instead of selling his process to one of the major oil companies on a royalty basis, and therefore perhaps encouraging a new monopoly, Mr. Keith wanted to share directly in the profits of his research and inventive genius. Second, and most important, he was unable in 1943 to interest sufficient risk capital to finance his venture.

He went to Mr. Jones. He also went to the Army, Navy, and the Department of the Interior. When they endorsed the project Mr. Jones told him that if he would raise half the necessary capital and obtain an option on a trillion feet of gas—enough to operate Carthage Hydrocol for 26 years—the RFC would loan the other half of the necessary funds.

Mr. Keith met these requirements. I was his legal counsel, and I became counsel for the company he organized—Carthage Hydrocol. After the first RFC loan was granted I was asked to become president of Carthage Hydrocol.

These facts were known when you did me the honor of electing me chairman of the Republican National Committee on August 4, 1949. It was also known to you that I would continue as president and general counsel for this company, which at that time owed the RFC \$18,500,000. It owes the same amount today—not a penny more. And I was about to say, not a penny less, except that last Thursday, 5 days before the due date, Carthage Hydrocol made its first repayment of the loan in the amount of \$250,000.

Now the reason I continued to serve this company as president, and my law firm as counsel, is that I felt an obligation not only to the taxpayers who put up \$18,500,000 for this pioneering industry, but to the stockholders who now have put up more than \$28,000,000, to contribute everything I could to making this venture a success. You understand, of course, that until the RFC loan is paid off the Government has a first mortgage on the entire property. Until the Government is paid off the stockholders can't get 1 cent of their money back, regardless of how profitable the company's operations may be. I want to say here it is as safe a loan as the RFC ever made.

I recognize that \$18,500,000 is a lot of money. But I think we almost must recognize that many times that sum is being spent through the Department of the Interior to develop synthetic fuels from coal and oil shale. The Bureau of Mines is presently asking legislation to authorize the spending of \$400,000,000 for this purpose. I believe implicitly in private enterprise, and I am proud that private enterprise has put up the bulk of the funds for Carthage Hydrocol.

Let me quote a portion of what Fortune magazine said of this venture:

"It is a mammoth conception in which three separate companies are interlinked. Carthage Hydrocol, Inc., the key unit, takes in a huge stream of natural gas and oxidizes it into some 7,000 barrels of gasoline and oil products a day. At the same time, it pulls out a mixed stream of water-soluble crude chemicals at the rate of 300,000 pounds a day and pipes it next door to a unit owned by Stanolind Oil & Gas Co. Stanolind separates and refines the mixed stream into some 20 basic chemicals—more to come later—including most organic acids, alcohols, a string of ketones and aldehydes, and pipes them on to a unit of United States Industrial Chemicals, Inc., which ships them elsewhere for further processing and marketing.

"The full engineering feat—collaborated in by all participants and based on process engineering by Hydrocarbon Research, Inc., and Texas Development Co.—cannot yet be explored, but some details will show its Texas scope. To get the amounts of oxygen required, the world's largest oxygen-from-air plant was built, of a new design, equal to all the rest of the oxygen-fixation capacity in the United States combined. To get the huge amounts of cooling water needed from arid Texas, cooling systems were devised to use salt water sucked in from the Brownsville Ship Canal at 144,000 gallons a minute. To handle the high heats and pressures involved, vessels of ponderous new shapes were designed. The big gleaming thermos bottles, for example, are gas-fired furnaces some 60 feet high. To get such a series of plants on stream—started in order, coordinated, and running simultaneously—is the top engineering feat of all."

The Fortune article concludes: "It is a giant pilot plant of a new order, built with great risk and courage."

Fortune did not exaggerate. The process has been proven. The plant has operated successfully over various periods during the last several months, but we also have encountered mechanical failures. We are not yet in continuous, full-time commercial operation.

As many of you know, the RFC doesn't loan money and then forget about it. It keeps a continuing check on its debtors. Since I have been chairman of the Republican National Committee, the RFC has called upon me, as representative of the debtor, for information on various aspects of Carthage Hydrocol finances and operations. Since the loans were made, there have been 30 resolutions and amendments by the RFC pertaining to this project, 10 of them since I have been your chairman.

When the RFC was managed by a board, before the recent reorganization, Mr. Harvey Gunderson was assigned to keep an eye on this loan, and I discussed details of Carthage Hydrocol with him and his staff on at least two occasions. I neither asked favors, nor received any, from him.

After Mr. Stuart Symington became RFC Administrator, I called upon him with two other top officers of Carthage Hydrocol to introduce ourselves. This occurred in the latter part of June or early July. During this visit, I asked Mr. Symington to have the Carthage Hydrocol files investigated, and to state publicly whether he found anything wrong or improper, and to also state publicly if he found nothing wrong nor improper.

During our conversation, he asked about our finances. I told him we had encountered mechanical difficulties, and our executive committee was considering making a request for deferment for 1 year of the first repayment of principal of two of the loans. This was a matter of information—not a plea.

On August 1, 1951, our treasurer, Mr. Allen K. Brehm, signed a formal application to the New York office of the RFC requesting this deferment. In view of recent comments, it is important to stress that this application conformed to the spirit of an agreement twice previously recognized by the RFC—namely, that there would be a lapse of 21 months between the start of operations of the plant and the first repayment of principal.

Owing to delays, the plant was not completed until late 1950. Since that time, we have had numerous difficulties with various pieces of equipment. The plant has operated on 10 different occasions for varying lengths of time turning out a fine product. The longest run was for 24 days, but we still have problems to solve before we can attain continuous operation on a commercial basis. We felt, therefore, that under the spirit of the two former RFC decisions, we were justified in requesting the deferment.

The RFC rejected this application, as was its right. The first repayments, due today, were made last Thursday. As president of Carthage Hydrocol and as chairman of the national committee, I haven't and don't intend to challenge the RFC decision, but I can't refrain from suggesting that it scarcely bears out the inference that I have any influence.

Early last March, I discussed the moral climate of the Truman administration in a speech at Elgin, Ill., and said that the exposure of corruption warranted the Republican Party to revive the old battlecry, "Turn the rascals out." I was warned in advance that if I spoke on this subject, the opposition undoubtedly would attack me because of my position with Carthage Hydrocol. I made the speech and I was attacked. On March 27, I addressed an open letter to all Republican leaders and the press giving full details of the history of this RFC loan, and making it plain that I was proud to be the Carthage Hydrocol president and have a part in the development of this challenging new industry.

Recently, because of information that the opposition intended to attack me again, a Republican Senator asked that all the facts be presented to the Senate subcommittee investigating influence-peddling by others. I promptly asked for an immediate hearing. When that was denied, I prepared a letter to the subcommittee calling attention to my statement of March 27, and bringing it up to date.

The subcommittee has notified me that it will hear me this Thursday. In my testimony under oath, I will answer all questions, and will state that in addition to my two talks to Mr. Symington, I also had two conversations with Mr. Oscar Chapman, Secretary of the Interior, to ascertain what steps Carthage Hydrocol should take to obtain certain nickel alloys required for resumption of operations of the plant. I have had a preliminary talk with the subcommittee's counsel, and have advised him that he can examine not only my income tax returns for 1949 and 1950, but the detailed work sheets from which they were prepared.

I have met, and will continue to meet, this issue with complete frankness. And in closing, let me say that I propose to continue to denounce, in the most vigorous terms, the scandals and corruption attached to the present national administration, and the refusal of President Truman to move promptly and vigorously against those responsible. I shall discuss mink coats, deep freezes, influence-peddling, pardons to gangsters, vote frauds, Pendergastism, and every other aspect of what has been called by a national magazine the underbelly of the Truman administration. I shall continue to try to convince the public that these scandalous years fully warrant, if for no reason, turning these rascals out in the election of November 4, 1952.

Center of United States Population Moves to Richland County, Ill.

EXTENSION OF REMARKS

OF

HON. EDWARD H. JENISON

OF ILLINOIS

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. JENISON. Mr. Speaker, with pardonable pride, I take this occasion to call to the attention of my colleagues in the House of Representatives the fact that the center of population in the United States, as revealed by the 1950 census, is now in the Twenty-third Congressional District of Illinois and specifically in Richland County, not far from the city of Olney.

Thus the theoretical center of American population is located in the heart of a typical, progressive American county well typifying the Nation and its people. For Richland County is representative of the backbone of strength in the country. Agriculture and oil contribute to its prosperity. Olney, the county seat, is typical of the best in community life and good citizenship. Thus the graphs and charts of the Bureau of the Census have placed a point of fame on an area and a community reflecting the substantial economy of a prosperous and patriotic people.

This important event will be observed with a Nation-wide ceremony centering on the site in Richland County October 17 and 18 when an official marker will be dedicated, to prevail as the official designation of the center of population during the next decade. The story is best told in the Olney Daily Mail of Saturday, September 29. Under permission granted me by the House, I include it as follows:

The center of population of the United States is in Richland County.

Director Roy V. Peel, of the Bureau of Census, United States Department of Commerce, today announced that the center of population, based on the 1950 census, is 8 miles north-northwest of Olney.

As can best be determined by maps and plat books, the center of the Nation's population falls on the farm of Carl Snider, adjoining the farm of Dewey A. Craig, chairman of the Richland County Board of Supervisors, in east Denver township. Maps on the center of population, as furnished by the Bureau of Census, appear elsewhere in this issue.

Mr. and Mrs. Snider and two small sons are a typical Richland County farm family. They have a 160-acre farm which 33-year-old Carl farms, and although virtually surrounded by oil production, do not have an oil well on their farm. The only oil venture on the 160 acres was a dry hole.

Census Director Peel also announced plans for a 2-day ceremony in mid-October to mark the transfer of the center of population from Indiana to Illinois. On Thursday, October 18, the dedication of a marker at the new population center near Olney will conclude the 2-day program.

Among those who will participate in the program, which will be presented on chain hookups over radio and television, are United States Secretary of Commerce Charles Sawyer; Census Director Peel; Gov. Adlai Stevenson, of Illinois; Gov. Henry Schricker, of Indiana; mayors and other representatives of the 17 places where the center of population has been located between

the first decennial census in 1790 and the seventeenth decennial census in 1950.

The previous day, Wednesday, October 17, a program marking the departure of the center of population from Indiana, after its slow travel across that State during a period of 70 years, will be conducted in Bloomington, Ind.

Although the exact center of population has not been officially designated, it appears to be on the Snider farm, a short distance west of the Snider residence in east Denver township. Official location of the exact spot is expected to be made in the near future and representatives of the United States Department of Commerce are expected to be here prior to the October 18 celebration.

The Richland County center of population is 42 miles west and 7½ miles south of the center of population in 1940, which was located 2 miles southeast by east of Carlisle, Ind.

The total westward movement of the center of population from 1790 to 1950 was 644 miles, from its 1790 location at a point 23 miles east of Baltimore, Md. The point farthest north was the 1790 location and the point farthest south the 1950 location in Richland County, but the north and south difference is only 30 miles. Thus the center of population has remained within a few miles of the thirty-ninth parallel, north latitude, in its long westward movement.

The population crawled westward across the country with the early trappers and backwoodsmen; rolled on with pioneers in their covered wagons, and is shifting nearer and nearer the Mississippi River with the growth of huge cities on the west coast.

The center of population is one of these imaginary but important reckonings, like the North Pole or the Equator. Just a dot on the map, it is a symbol that tells how the country is growing, it is an indication of trends and the movements of people and industry.

Several years ago, with the center definitely moved from Indiana westward into Illinois, it was believed the center of population was in the vicinity of West Liberty, in south Jasper County. The decided shift of 7½ miles to the south during the past 10 years moved the center into Richland County.

In the early days of the United States, the East was literally the whole Nation. The census of 1790 set the first official center of population 23 miles east of Baltimore and by 1800 the center had moved only 19 miles west of Baltimore. But thereafter, as the country's restless pioneers craved the perils of Indians and primitive living conditions to surge westward in wagon and flatboats, the move was in great leaps.

By 1810, the center had passed Washington, D. C. From 1820 to 1840 it shifted through West Virginia. It swept on even during the Civil War. By 1860 the center of population crossed the Alleghenies into Ohio, continuing its move across the State in 1870 and 1880.

In 1890, the center shifted from a point near Cincinnati into Indiana, in the vicinity of Columbus, Ind. Bloomington, Ind., where the October 17 celebration will be held, was the center in 1910. In 1920 it had shifted to near Spencer; westward and southward to Linton in 1930, then in 1940 to near Carlisle, near the border of Illinois.

It appears likely that the trends of the last 10 years will continue, mainly due to the fact that California's population hit 10,586,223 in the 1950 census, a gain of almost 3,500,000 from 1940. The big west coast State forged ahead of Illinois and Ohio to become the third most populous State in the Union, and the populations of Washington and Oregon also mushroomed.

Although a few of the States west of the Mississippi lost in population—North Dakota, Arkansas, and Oklahoma—the gain on the booming west coast was so great that the

center was still pulled westward 42 miles in 10 years.

New York has its Dodgers, Yankees, Giants, and the Statue of Liberty; California has its oranges and movie stars; but when you live in Illinois and Richland County, you're really in the center of things.

The approximate location of the center of population of the United States of each census from 1790 to 1950:

1790: 23 miles east of Baltimore, Md.
1800: 18 miles west of Baltimore, Md.
1810: 40 miles northwest by west of Washington, D. C. (in Virginia).
1820: 16 miles east of Moorefield, W. Va.
1830: 19 miles west-southwest of Moorefield, W. Va.
1840: 16 miles south of Clarksburg, W. Va.
1850: 23 miles southeast of Parkersburg, W. Va.
1860: 20 miles south by east of Chillicothe, Ohio.
1870: 48 miles east by north of Cincinnati, Ohio.
1880: 8 miles west by south of Cincinnati, Ohio (in Kentucky).
1890: 20 miles east of Columbus, Ind.
1900: 6 miles southeast of Columbus, Ind.
1910: In the city of Bloomington, Ind.
1920: 8 miles south-southeast of Spencer, Ind.
1930: 3 miles northeast of Linton, Ind.
1940: 2 miles southeast by east of Carlisle, Ind.
1950: 8 miles north-northwest of Olney, Ill.

Our Army (Forever Victorious)

EXTENSION OF REMARKS

OF

HON. JOHN V. BEAMER

OF INDIANA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. BEAMER. Mr. Speaker, by request, I include a new song dedicated to Our Army.

The composer has given me an autographed copy of his original composition. The above-mentioned song follows:

OUR ARMY (FOREVER VICTORIOUS)

(Lyrics by Grant S Ray, music by C. T. Loughner)

Our Army fought with skill
In its fight at Bunker Hill
Til the flag of foe came down
In defeat at old Yorktown
Our Army fought again
With a heart and will to win
So we met and whipped a foe
To avenge the Alamo.

Then we met ole Kaiser Bill
Stopped him cold at Verdun Hill
Then we went to war again
Licked Japan and Hitler's men.

Our Army now you know
Is at war in Korea
Where our men fight commie hordes
Shall be our great victory
Our Air Force is there too
Fight for God's way and you
United Nations will win
And save the world for the free.

Our Army of today
Is the pride of U. S. A.
All its men and WAC's are true
To our flag, red, white, and blue
Our Army stands near by
Where the stars and stripes fly high
To defend our liberty
And the freedom of the free.

Representative Edith Nourse Rogers, of Massachusetts, Wins Disabled Veterans' Admiration

EXTENSION OF REMARKS

OF

HON. J. ERNEST WHARTON

OF NEW YORK

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. WHARTON. Mr. Speaker, under leave to extend my remarks in the RECORD, I wish to include an article in the October issue of the Civil Service Reporter bearing upon the activities of our colleague, Representative EDITH NOURSE ROGERS, of Massachusetts:

REPRESENTATIVE EDITH NOURSE ROGERS WINS DISABLED VETERANS' ADMIRATION

The youngsters who have come back from Korea, shattered in mind and body, are pretty cynical about Congressmen and Senators in general. You can't expect boys of 18, 19, and 20 who have lost an arm or a leg, or both arms and legs, or who have been blinded or paralyzed in combat to display a calmly philosophical attitude toward the world as it is. They are full of a bewildered resentment toward everything and everybody, and it is not surprising that the legislators who breeze through the wards of Walter Reed Hospital with a jovial "Hi, Joe," and expressions of deepest sympathy are described as those phonies! And it may be childish, but it is very natural that they extend the resentment toward one or two Congressmen to include all Congressmen and Senators.

But there is one Congressman, or rather Congresswoman, who is exempt from their youthful (but sometimes alarming) criticism. To the boys at Walter Reed, and perhaps to all wounded veterans everywhere, EDITH NOURSE ROGERS is a gracious and wonderful woman, who by the greatest of good luck is in Congress and is on their side. Not only on their side, but, "I think she really likes us," one shy youngster said to me.

FIGHTS THEIR BATTLES

She really does like them, and is certainly on their side, fighting their battles to the last ditch. The picture in this issue which shows her cutting a birthday cake, is typical of Mrs. ROGERS. The boy at her left, Bruce Clemens was 21 on the day the picture was taken. Bruce lost both legs in Korea. He is a shy, well-mannered quiet boy who doesn't talk much, but does a lot of thinking, maybe too much thinking sometimes. When he came back to this country he didn't want to talk to anybody, and the secret thoughts of a boy of 20 who has just lost both legs are black and dreadful. It is a long, difficult job to persuade these boys that they are tough enough and strong enough to accept the world as it is and to enjoy life, even though it is a different kind of life than they planned on in high school.

Having a birthday party for a boy who has had tough luck is not part of a Congresswoman's job. She is fighting tooth and nail for legislation which will make life more bearable for seriously disabled veterans. Her life is full from early morning until late at night. She has earned the gratitude of all veterans as a group because of her untiring efforts in their behalf. So a birthday party for one wounded veteran doesn't make sense in terms of legislation or votes. It's just one of the things that Mrs. ROGERS does because she really likes the boys. And do they like her? Well, as one exuberant young man said, "I sure wish she was younger, or I was older. She's wonderful!" She seems to

share a niche in their hearts usually reserved for mothers and/or best girls.

A REMARKABLE WOMAN

Mrs. ROGERS is, to put it mildly, a remarkable woman. The much-abused word "lady" seems to fit her perfectly and she suggests a background of chippendale furniture, rose gardens, and heirloom silver, but she has been in Congress since 1925, when she was elected to fill the vacancy caused by the death of her husband, the late Representative John Jacob Rogers, and she has been there ever since. To get elected to Congress year after year from Mrs. ROGERS' district takes more than graciousness and charm. In addition to charm, she is equipped with amazing energy and determination. In the area of legislation, she has often played alternate roles of immovable object and irresistible force.

Her interest in disabled veterans dates back to World War I years when she devoted her time to their problems. She was one of the first members of the Gray Ladies of Walter Reed General Hospital and went on a special mission to France and England during the hostilities.

THREE COMMITTEES

Upon entering Congress, she was assigned to the Committee on Foreign Affairs, the Committee on Civil Service, and the Committee on World War Veterans' Legislation. She served on these committees until the Eightieth Congress when the Reorganization Act limited to one the number of major committees on which a Member might serve. In the Seventy-ninth Congress she was the ranking minority member on two committees and in the Eightieth Congress became the chairman of the newly formed Committee on Veterans' Affairs.

During the time she served on the House Committee on Civil Service she sponsored and succeeded in getting approval for numbers of bills benefiting Government employees and especially benefiting veterans in civil service. Much of the legislation which protects the jobs of veterans in Government service, and especially the jobs of disabled veterans is due, at least in part, to the devotion of Mrs. ROGERS to the cause of the veterans. She believes that one of the most important steps in the rehabilitation of a badly wounded veteran is when he is appointed to a job and realizes that he is still able to earn a living. The program of the United States Civil Service Commission to aid badly disabled veterans by emphasizing what they can, rather than what they cannot do, is one of its finest achievements. This program has had the wholehearted support of Congresswoman ROGERS since its inception.

Patriotism at a Price

EXTENSION OF REMARKS

OF

HON. GEORGE H. BENDER

OF OHIO

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. BENDER. Mr. Speaker, no one has yet managed to explain why it is necessary for the Air Force and the Army to spend \$688,000 for a radio-recruiting program. The Air Forces have been able to get plenty of young men through normal channels without indulging in these extravagances in the not too distant past. During the war era, in fact, young people were breaking

down the doors to get into the Air Corps. The Army has never had similar appeal, and it is at least doubtful that Frankie Layne's rendition of Mule Train will cause our boys to stampede into recruiting lines.

At last reports singer Layne and sportscaster Bill Stern were to be engaged for this radio appeal, at fees to be agreed upon by our Government spending experts. Mr. Stern was down for the mere pittance of \$1,000 per week and Mr. Layne apparently was earmarked for a bigger production job amount to a total of some \$434,000. These figures, although published generally, seem fantastically high for the purpose, and particularly so when viewed in the light of the statement that they have been reduced because of the patriotic purpose involved.

Patriotism at a price always seems shabby. When it is utterly unnecessary and a complete waste of taxpayers' funds, you can understand why lots of Americans are ready to be led away to the padded cell department screaming, "When does this business stop?"

Economy in Government

EXTENSION OF REMARKS

OF

HON. JOHN PHILLIPS

OF CALIFORNIA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. PHILLIPS. Mr. Speaker, under leave to extend my remarks in the Record, I include the following open letter by Charles L. Campbell, published in Connecticut Taxpayers News:

AN OPEN LETTER TO MEMBERS AND FRIENDS
OF THE COUNCIL

(By Charles L. Campbell, chairman of the board)

For a great many years I have been battling for economy in government. In recent months a number of people have expressed the opinion to me that the fight for economy seems to be petering out. These friends of economy are very pessimistic over the possibility of getting sensible and sound financing of government and most especially are they gloomy about the Federal Government. For a time I was inclined to feel that there was ample justification for the forebodings which they expressed, but I have been examining the situation and I have come to the conclusion that there is a considerable ray of hope existing.

In my experience as a businessman and in my association with the council, I have discovered that no budget is sacrosanct. In fact, one can say with reason that budgets are made to be cut. A small but determined and gallant group of Senators and Representatives in the United States Congress agree with this belief. In my judgment, they have been given inadequate support for their efforts. Men like Senators FERGUSON, BYRD, DOUGLAS, BRIDGES, DIRKSEN, McCLELLAN and Representatives TABER, JENSEN, PHILLIPS, and HOWARD SMITH, of Virginia, have been devoting their energies to a reduction of the vast Federal budget for fiscal 1952. That they have not been more successful is no measure of the time, energy, and diligence with which they have approached this task. One could wish

that the economizers might receive more support than they have had from some members of the Connecticut congressional delegation.

I want to take this opportunity publicly to acknowledge the work that these economy-minded Members of the House and Senate are doing and to give them a word of encouragement so that their endeavors will continue. Unless the citizens and taxpayers everywhere in the country give aid and comfort to their friends in the Congress, the spending will go merrily on and the pessimist will be proved right because congressional economy advocates will lose heart and give up the fight. We have the opportunity to bring some sanity into Federal finances, but we must continue to fight for it and to support those in Congress who are trying to achieve it.

Is Joseph Stalin the Real Author of Point 4?

EXTENSION OF REMARKS

OF

HON. HOWARD H. BUFFETT

OF NEBRASKA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. BUFFETT. Mr. Speaker, in recent months many of us have been amused by Russian claims of being first with various modern inventions and discoveries. Most of such claims from Moscow have been obviously humbug.

However, my attention has been called to an item which the Russians—and in particular, Joseph Stalin—can apparently legitimately claim as their origination. I refer to the proposal announced by President Truman under the title "Point 4." Here is the evidence.

On May 8, 1921, Stalin declared:

The fourth factor is that a new element has been introduced into the national question—the element of real (and not merely juridical) equalization of nations (helping and encouraging the backward nations to raise themselves to the cultural and economic level of the more advanced nations), as one of the conditions necessary for securing fraternal cooperation between the toiling masses of the various nationalities (Piauda).

Twenty-eight years later President Harry Truman made a similar declaration in these words:

Fourth. We must embark on a bold, new program for making the benefits of our scientific advances and industrial progress available for the improvement and growth of underdeveloped areas. (Inaugural address, January 20, 1949.)

I suppose it is by pure accident that the number "four" was affixed to almost identical proposals 28 years apart. If so, it is a startling coincidence.

But it raises the question whether point 4 is part of a Russian master plan to deplete our resources and destroy us economically. Although so far it is only a relatively small item, it certainly propels us down the road of unending global outlays.

Because of the similarity between point 4 and the fourth factor of Joseph Stalin, I am including the text of his remarks on this subject as recorded in Marxism and the National Question, by

Joseph Stalin, published in 1942, by International Publishers.

While on this subject, I would like to report my own opinion of point 4. I regard it as a type of meddling, professedly well-meaning in nature, that will make us enemies and lose us friends in foreign lands. I have only contempt for the glib propaganda that point 4 is a device that improves upon the efforts made by our foreign missionary societies. I believe that point 4 has been concocted and "sold" to the Fair Deal by so-called liberals whose real allegiance is to the philosophy of collectivism.

The Stalin excerpt is as follows:

The fourth factor is that a new element has been introduced into the national question—the element of real (and not merely juridical) equalization of nations (helping and encouraging the backward nations to raise themselves to the cultural and economic level of the more advanced nations), as one of the conditions necessary for securing fraternal cooperation between the toiling masses of the various nationalities. In the period of the Second International they usually confined themselves to proclaiming "national equality;" at best they did not go beyond demanding the realization of such equality. But national equality, in itself a very important political acquisition, runs the risk of remaining merely an empty phrase. Adequate resources and opportunities for exercising this very important right do not exist. There can be no question that the toiling masses of the backward peoples are not in a position to exercise the right of "national equality" granted them to the degree that it can be exercised by the toiling masses of advanced nationalities. The actual inequality of nations (cultural and economic), which is a heritage of the past and which cannot be abolished in 1 or 2 years, makes its influence felt. This circumstance is particularly perceptible in Russia, where a number of nationalities have never passed through capitalism, and some have not even entered the phase of capitalism, and have no proletariat, or practically no proletariat, of their own; where, in spite of the fact that complete national equality has already been established, the toiling masses of these nationalities are not in a position to make adequate use of the rights they have won in view of their cultural and economic backwardness.

This inequality will make itself felt still more on the morrow of the victory of the proletariat in the west, when numerous backward colonies and semicolonies, marked by the most varied levels of development, will inevitably appear on the scene. That is why it is essential that the triumphant proletariat of the advanced countries should render aid, real and prolonged aid, to the toiling masses of the backward nationalities in their cultural and economic development, that it should help them to rise to a higher stage of development and to catch up with the more advanced nationalities. Unless such aid is forthcoming it will be impossible to bring about the peaceful coexistence and fraternal collaboration of the toilers of the various nations and peoples within a single world economic system that are so essential for the final triumph of socialism.

But from this it follows that we cannot content ourselves with national equality and that national equality must be extended by means of measures for securing the real equality of nationalities, and that we must proceed to work out and put into effect practical measures in relation to—

1. The study of the economic conditions, social life, and culture of the backward nations and peoples;

2. The development of their culture;

3. Their political education;
4. Their gradual and painless incorporation into the higher forms of economic life; and
5. The organization of economic cooperation between the toilers of the backward and advanced nationalities.

Such are the principal factors which distinguish the new formulation of the national question as given by the Communists. (Pravda, May 8, 1921.)

Probe Polish Massacre

EXTENSION OF REMARKS OF

HON. DANIEL J. FLOOD

OF PENNSYLVANIA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. FLOOD. Mr. Speaker, under leave to extend my remarks in the Record, I include the following article which appeared in the Times-Leader, the Evening News, Wilkes-Barre, Pa., on September 26, 1951, entitled "Probe Polish Massacre":

PROBE POLISH MASSACRE

Adoption of a resolution by the House of Representatives in Washington, authorizing an investigation of the massacre of Polish Army officers at Katyn, near Smolensk, Soviet Russia, promises a solution to one of the greatest mysteries of the Second World War.

It was just a decade ago that the civilized world was horrified by the disclosure that the bodies of 5,000 Polish officers had been found in a common grave. Altogether, 16,000 officers disappeared, but the others, although presumed dead, were never located.

When the news came to light, the Communists immediately accused the Nazis of the slaughter. But subsequent developments indicated the massacre was decreed by the Kremlin. The purpose obviously was to weaken Poland so it would be ready for the kill when the Communists were free to take over the unfortunate land.

A United States Army officer, who investigated the crime during the war, wrote a detailed report in which he exonerated the Nazis and pinned the crime on the Reds. But this report disappeared from the files of the War Department in Washington. A great many documents were conveniently removed during that period when Red agents had access to secrets of our Government.

It will be recalled that the Katyn massacre did not figure in the Nuremberg trials, although genocide was among the charges against the Nazis. Apparently it would have been very embarrassing for the Red judges to have certain matters, connected with this crime, brought before the bar of international justice.

The Soviet Union has managed to put the quietus on Katyn until now. Thanks to the activity of Representative DANIEL L. FLOOD of Luzerne County, among others, the facts are going to be ascertained and the record filled in. Incidentally, Representative FLOOD has been named vice chairman of the investigating committee, headed by Representative MADDEN, of Indiana.

Not only Americans of Polish extraction but others who believe in justice will welcome this belated attempt to fasten the blame for this massacre where it belongs. There is no time to lose because many of the witnesses and documents that might throw light on the subject will disappear soon, if they already are not gone. But there ought

to be sufficient evidence in Washington and from Polish exiles and others to record a verdict that will arrive at the truth for the benefit of this generation and succeeding ones.

Republican Advice From the West

EXTENSION OF REMARKS

OF

HON. ANTONIO M. FERNANDEZ

OF NEW MEXICO

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. FERNANDEZ. Mr. Speaker, in the September 28 issue of the Santa Fe New Mexican, published at Santa Fe, N. Mex., there appears an editorial on the occasion of the meeting of the 18 Republican State chairmen. This editorial from a paper which nearly all, if not all, the 100 years of its publication has been a Republican paper, is I think very timely. That editorial reads as follows:

HEAR OUR STORY, GOP

Today we welcome 18 Republican State chairmen to Santa Fe.

In these times when many burning issues seem too complex for single minds to grasp, the leaders of this great political party may find a lesson in the history of our small but ancient commonwealth, New Mexico. Our first 80 years in the Federal Union—Territory and State—we spent mostly in Republican ranks. Nothing breeds conservatism like the frontier, where wealth comes only to those who tear it barehanded from the fangs of nature.

Life is not always ruthless to the weak and small. But life is implacably ruthless to those who cannot change. In the early thirties, when our State had the highest hunger, disease, and death rates in the country, it was the then dominant Republican Party which did not change. And it was the people of New Mexico who made the change.

For the next 13 years New Mexicans followed what they believed to be the inspired leadership of a great man in another party. When this historic figure passed on our people turned—in spite of profuse advice—to the man who picked up where he left off.

The people of New Mexico were not then moved by tales of ice boxes, fur coats, or Atlantic City week ends. After all, New Mexico had been the home of Albert B. Fall.

They were not stirred by mistakes or failures of untitled men, pressed reluctantly into the job or world leadership. These New Mexicans had seen their crops fail and their herds die, because they themselves had failed to outguess elements they did not understand.

They were not interested in how smart a candidate was—they laid no claim to being smart themselves. Or whether he had been a general—they had been privates, the most unimpressive privates in history. Or who called whom Communist—as long as they could apply their own best loyalty test of all: similarity to themselves.

They did not care who stood for inflation or deflation. All they wanted was a Government dedicated to keeping their earnings in step with their living expenses.

Regardless of what the party now in power may say during the coming campaign, the people will ignore its words and judge its record. That record they will judge less by administrative successes or failures than by whether the Nation's slow movement through history is in the direction their own hearts elect.

But as for the party out of power, the people can judge it only by its words. Are the Republicans the party of shrinking ourselves inward upon half a continent, the party of accepting would leadership which has been thrust upon us; or the party of launching new wars on distant continents without allies? The party out of power now speaks with all these voices.

Before the national convention ends, one or the other of the warring Republican factions will come out on top, or the different factions will get together on a compromise candidate. But during the past five national elections the people of New Mexico, once a Republican State, have demonstrated that they will make no man President until they are convinced that he and his party are wholeheartedly one, and will remain as one, on those few basic principles the people have already chosen for themselves.

Let's Quit Knocking America

EXTENSION OF REMARKS

OF

HON. GEORGE M. RHODES

OF PENNSYLVANIA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. RHODES. Mr. Speaker, under leave to extend my remarks, I include herewith an editorial from the Fort Worth Labor News:

LET'S QUIT KNOCKING AMERICA

It has become quite popular in recent months to run down the American Government. We hear it all about us—on the buses, at the cafe counter, and especially at the luncheon clubs. It even goes on, unfortunately, in some churches and Sunday schools.

The ironical thing is that the people involved are those who wrap the mantle of patriotism about themselves, and pose as the defenders of the American system. They are not. The type of lip service which they mouth is a far cry from the fierce patriotism of the mass of Americans who, however inarticulate they may be, stand up with deep, heartfelt pride in theirs, the best government in the word—because they are the government.

Yes, some of the best people today, having ceased to think for themselves, are throwing their hats in the air and handclapping over some of the most dangerous and subverting drivel ever dished out under the guise of Americanism. And you can put this in your pipe and smoke it. If freedom ever topples in this country, it will not be because the Communists could beat us on land, or sea, or in the air—or in the hearts of men. It will be because we listen to the sirens of distrust in our own midst, lose faith in our own wonderful system, and forget that by the grace of God and the heroism of our forefathers, we are the Government in America.

Yes, daily in Fort Worth—and all over the Nation—men of prominence are rising to their feet, often under the shadow of the American flag, and shouting against the Government.

We are not speaking of those who simply disagree with Mr. Truman, or think Mr. MacArthur was right, or don't like Secretary Acheson. Heaven knows, in the America we love, there is plenty of room for such disagreements.

We are talking about those luncheon club speakers and others who launch tirades against "the Government," who by emotional appeal set the people off on one side, and

the Government off on the other—as if the Government today had not been voted lawfully by the people, and may not well be voted out at the next election.

We are talking about those who, thru emotion, stir up one segment of our marvelous land against another, as, for instance, these same people stir up business and professional men against labor and the fine labor unions of this country, and contrive to make patriotic union men and women out as subversives. We are talking about those who wave the flag against "bureaucrats," and denounce as pink conspirators all those who have devoted their lives to one of the finest services a man may render—public service.

We are talking about the stream of hate for our own Government which flows from that slander mill known as Harding College in Searcy, Ark., which ladles out, ready-made, the most dangerous and undermining stream of propaganda now flowing loose in our country.

It is dangerous because it seeks to convince us that our Government—not just our present administration—is to be distrusted. In fact, it really seeks to convince us that all government is an evil thing—that positive community action to meet community problems is nothing but Russian-type communism in disguise.

To sell us this miserable bill of goods, it even distorts history and tries to convince us that Russian-type communism was what made Rome fall, and Athens fall—and is what motivates Britain today. Personally, we have no doubt that Russian-type communism would have been enough to make Rome and Athens fall, or any other nation, for that matter.

But to any careful student of history, such an interpretation is plain dishonesty, calculated to frighten uninformed Americans and turn them against their own democratic government. And it is surprising how many adult, supposedly educated men and women are drinking it in.

America's government remains the greatest in the world, and will remain so as long as the people zealously guard their possession of it, and their faith in it.

We're getting blamed tired of all the self-appointed prophets of doom who want to protect the American people from themselves.

We trust the people one whale of a lot more than the prophets.

Top Secret, Secret, Confidential, Restricted

EXTENSION OF REMARKS

OF

HON. GEORGE H. BENDER

OF OHIO

IN THE HOUSE OF REPRESENTATIVES

Tuesday, September 25, 1951

Mr. BENDER. Mr. Speaker, the blinders are on, boys, and you had better keep your mouth shut, too. This is the significance of the new Truman directive to all agencies throughout the executive branch of our Government. Henceforth, they are to issue no statements or other information which requires safeguarding in order to protect the national interest. The four categories employed by the State and Defense Departments to withhold significant items from publication, top secret, confidential, and restricted, are henceforth to become the watchwords of all executive agencies.

Just what this might mean is not difficult to guess. A congressional investi-

gator seeking to discover how many employees have been added to a special department might be told promptly that this was restricted data, whose revelation might give valuable tips to the potential enemies of the Nation. Nonsense of this kind has always been possible when censorship has been invoked in the name of national emergencies.

At this particular time, when so many of the Federal agencies are under careful scrutiny, the new order takes on particular meaning. Despite the President's assertion that it is not censorship, it will look like censorship, it will act like censorship, and unless the American press is very much mistaken, it will also smell like censorship.

What Do the People Want?

EXTENSION OF REMARKS

OF

HON. ANGIER L. GOODWIN

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. GOODWIN. Mr. Speaker, in the midst of a very genuine apprehension that the policies of the Truman administration seem to be inevitably leading us down the road toward state socialism, an editorial from the Everett (Mass.) News-Gazette of September 21, 1951, bolsters up our abiding faith that the majority of our people are really opposed to socialism and that they may be depended upon to act wisely at the ballot box. Under leave to extend my remarks, I include the editorial as follows:

WHAT DO THE PEOPLE WANT?

Do the people want socialized electricity? A great many politicians claim they do—or, at least, that they will accept it willingly. But the available factual evidence presents quite a different picture.

The Pacific Northwest is a good example. It contains some of the Government's largest power dams. The tax-paid Washington propaganda boys have beaten the drums for so-called public power for years. Everything possible has been done to make the voters believe that only Government can assure them an adequate electric supply at a low cost.

Between 1946 and 1950, inclusive, in Oregon, the citizens of 17 towns and areas voted on proposals for municipal electric plants, or for the creation of public utility districts which would supplant the private utilities. In 15 cases the proposals were voted down, often by heavy majorities. In only two were they approved.

This year two such proposals have been voted on in the State of Washington. Both were decisively defeated.

It's hard to see how anyone could argue that these votes do not represent public opinion. Both sides presented their cases in full, and in every instance public interest was high. The voters simply weighed the proposals on their merits—and marked their ballots accordingly.

In the case of the Federal socialized power systems, the people have no direct voice—it's a case where socialism is forced down our throats whether we like it or not. But when the people can speak out, at the ballot box, socialism almost always gets the ax.

Resolutions Adopted by Sixty-first Annual Congress, Sons of the American Revolution

EXTENSION OF REMARKS

OF

HON. JOSEPH R. McCARTHY

OF WISCONSIN

IN THE SENATE OF THE UNITED STATES

Tuesday, October 2, 1951

Mr. McCARTHY. Mr. President, I ask unanimous consent that there may be inserted in the Appendix of the RECORD resolutions which were adopted by the Sixty-first Annual Congress of the Sons of the American Revolution, on July 11, 1951, at San Francisco, Calif.: First, preamble to the report of resolutions committee; second, resolution regarding United Nations; third, resolution on world government and Atlantic Union; fourth, resolution challenging propaganda of Communists and Fabian Socialists; and, fifth, resolution regarding support of public-school system.

I ask unanimous consent, Mr. President, that all these resolutions be inserted in the Appendix of the RECORD. I may say that the Congress of the Sons of the American Revolution is one of the outstanding patriotic organizations of the country and that while I do not agree with all of the details of two of the resolutions which are submitted I have been asked to request their insertion in the Appendix of the RECORD, and am doing it for that reason.

There being no objection, the resolutions were ordered to be printed in the RECORD, as follows:

RESOLUTIONS ADOPTED BY THE SIXTY-FIRST ANNUAL CONGRESS OF THE SONS OF THE AMERICAN REVOLUTION, JULY 11, 1951, SAN FRANCISCO, CALIF.

PREAMBLE TO THE REPORT OF RESOLUTIONS COMMITTEE

We note with a feeling of chagrin that even at this hour of peril to this Nation, scores of organizations and groups of agitators are feverishly working to undermine the faith of our people in the form of government bequeathed to us by our forefathers and to destroy the way of life under which this Republic became the most potent factor in world affairs.

We are not deceived by the high-sounding phrases of those fostering these movements. Whenever and wherever the masks have been pushed aside it has invariably developed that back of such movements are men who prefer a different way of life from that we have learned to love. Many well-intentioned people have been misled by their false propaganda and their half-truths.

We recognize such movements for what they are in truth and in fact. We know that most of their leaders, either open or underground, are not friends of, but are enemies of this Republic.

We commend the officials of this great organization for a year of untiring efforts to tell the people of America the whole truth about communism, State socialism, collectivism, one-world government, and all such movements and we also commend our committee and the congressional Committee on Un-American Activities for their valued efforts to unmask the leaders of these movements and develop the fallacies of their teachings. We are happy to note that no longer are men and women afraid of the

pernicious assaults on all those who seek to learn the truth about such movements. We are happy to note that there is a growing sentiment in these United States, that the enemy shall not prevail by dividing us in our thinking and thus make victory for the enemy inevitable.

We renew our faith in our Republic, its Constitution, its Bill of Rights, its program for the basic human freedoms we have enjoyed for so long, and we pledge our efforts to help preserve these basic human freedoms from attack from whatsoever source—to the end that representative government, our free-enterprise system, our freedoms under our Bill of Rights shall be preserved for our children and our children's children. We would be untrue to ourselves and our posterity, untrue to our forefathers and their way of life if we did not wholeheartedly and uncompromisingly resolve that those who would take from us our basic human freedoms and enslave us, under whatever flag or slogan, shall not succeed.

Respectfully submitted.

RESOLUTIONS COMMITTEE, SIXTY-FIRST
CONGRESS, SONS OF THE AMERICAN
REVOLUTION

RESOLUTION REGARDING UNITED NATIONS

Whereas the United Nations are a group of nations banded together for the sole purpose of preserving peace in the world, and

Whereas the United Nations has not preserved peace but has become a sinister organization, seeking to control the economic conditions of the world and to promulgate rules controlling civil conduct and government of the world under the guise of creating and perpetuating world-wide peace and that the purposes of peace have not been realized but have resulted in war; and

Whereas the plans of the United Nations are usurping and will eventually usurp the vested rights and privileges of American citizenship; and

Whereas the Constitution of the United States by the powers vested in the United Nations can be destroyed and authority exercised over the individual American citizen in every phase of his economic and political life; and

Whereas the entry of our Government into this international organization has forced upon the American citizen heavy confiscatory taxes and that actually people of the United States have paid and are now paying and financing 85 percent of the cost of the operation of this international organization without receiving any financial support from certain members nations; and

Whereas the United Nations, under powers delegated to it by our National Congress, actually changes international law affecting the individual rights of the American people, and

Whereas power has been delegated by our National Congress so that the power of the United Nations is superior to the power of the United States, and such power is actually in the hands of eleven or more men speaking for their government as members of this world-wide international organization; and

Whereas the actions of the United Nations in the past and in the future have been without asking for divine guidance and its sessions are opened without prayer to Almighty God to guide the membership in its deliberations and its acts and its deeds; now, therefore, since the foundation and framework and laws of our Government are grounded firmly upon the individual rights of the citizen and our paramount law is the law as announced by our time-honored Constitution, all based upon our belief in a Supreme Being; and

Whereas 78,000 casualties have resulted in an undeclared war now being waged in Korea; Be it, therefore

Resolved, That the United States withdraw from the United Nations at the earliest reasonable moment; and until such time, be it further

Resolved, That the Sons of the American Revolution in congress assembled at San Francisco on July 11, 1951, invite the attention of the President and the Congress to the dangers that lie in the adoption of committee reports of the United Nations submitted to the United States for adoption and that we recommend that the Executive and the Congress be cautious in taking action under the provision of the United Nations Charter, lest the very rights granted by our Constitution and Bill of Rights be lost and that the United Nations Charter and the proposed changes to strengthen it be not used to the destruction of the United States; and be it further

Resolved, That we earnestly request the United States Senate to promulgate and put in force a resolution whereby all future action of the Senate in the ratification of any treaty, affidavit, agreement or other commitment having to do with the foreign affairs of the United States shall not offend, impair or supersede the Constitution of the United States or of any State thereof or be effective for any purpose unless and until legislation implementing the same shall have been duly enacted by the Congress of the United States.

RESOLUTION ON WORLD GOVERNMENT AND
ATLANTIC UNION

Whereas the National Society of the Sons of the American Revolution in Congress assembled in Atlantic City, N. J., on May 17, 1950, adopted a resolution opposed to the United States becoming a part of any world government; and

Whereas there was introduced in the United States Congress on January 15, 1951, Senate Concurrent Resolution No. 4 and House Concurrent Resolution No. 26, worded identically and known as the Atlantic Union Resolution, and

Whereas the ultimate object of these resolutions is the formation of a federal union composed of the 7 governments that were parties to the Atlantic Treaty, and as stated by the proponents of the resolutions, may be extended to include the 12 governments now in the Atlantic Pact and eventually include more nations; and

Whereas such an Atlantic Union and world federation requires the United States to surrender important basic sovereign rights to the vote and control of these nations, some socialistic, others with strong communistic tendencies, giving them power over matters that affect the independence, prosperity, and life of the United States, power to cancel rights now guaranteed by our Constitution, power to alter the form of our National Government, and power to nullify State laws: Now, therefore, be it

Resolved, That the Sons of the American Revolution reaffirm their opposition to the entrance of or participation by the United States in any world-government plan or negotiation pertaining thereto, and, particularly, are opposed to those resolutions now pending in the United States Congress and to the action of the Senators and Representatives who have given their names as supporting these resolutions, and be it further

Resolved, That the National Society of the Sons of the American Revolution is unalterably opposed to the adoption of said resolutions and opposed to any form of world government involving the United States of America;

Resolved further, That copies of this resolution be sent to the President of the United States, the Secretary of State, Governors of all States, and Members of Congress;

Resolved further, That all State societies, and specifically the Sons of the American Revolution State Societies in the States represented by the 27 Senators and 92 Repre-

sentatives be requested to have their constituents register their respective disapproval with their Senators and Representatives who have approved said resolutions.

RESOLUTION CHALLENGING PROPAGANDA OF
COMMUNISTS AND FABIAN SOCIALISTS

Resolved, That we deem it appropriate at this meeting, held on the one hundred and seventy-fifth anniversary of the signing of the Declaration of Independence, to promulgate the following statements concerning the propaganda attack being made on our Constitution and republican form of government.

First As to the alleged right of revolution asserted by the Communists

A vital part of the propaganda of the Communist Party is the repeated appropriation of a right to bring about revolution by force, violence, or other unconstitutional means; the misuse of quotations from utterances of American patriots such as Thomas Jefferson and Abraham Lincoln to create belief in such a right, and the claim that legal control over revolutionary activities is an infringement of civil liberty and a denial of free speech

There is no such thing as a right of revolution to accomplish the objectives of the Communist Party. Under the Declaration of Independence governments derive their "just powers from the consent of the governed." Dictatorship of the proletariat is tyranny. It is un-American and a violation of this Declaration to the same extent as any other dictatorship

These false claims of the Communists are a libel on the reputation and integrity of the great men who established free government in America.

It is time for all patriotic men and women to denounce and expose these false claims and to declare their true purpose, which is to furnish a legal basis for treason

Second In regard to the so-called right of infiltration used by Fabian Socialists and advocates of the social welfare state as a means of seizing and exercising governmental power without the knowledge or consent of the people

The signers of the Declaration of Independence pledged themselves "with a firm reliance on the protection of Divine Providence" to support it with their lives, their fortunes, and their sacred honor

Men accepting public office assume this legal and moral obligation. Public office is a public trust. The Federal Constitution requires Senators, Representatives, members of State legislatures, and executive and judicial officers of the United States and of the several States to take a solemn oath or affirmation to support its provisions. This oath imposes an obligation binding on the conscience of the one taking it, aside from any legal responsibility which may attach. From the moral and ethical standpoint, it is dishonorable and under present conditions equivalent to treason for any man to take such an oath without the intention of performing it. The disregard of the obligation of integrity represented by these oaths represents one of the most serious threats to the maintenance of our republican form of government

There is no right entitling any Fabian Socialist, National Socialist, or other revolutionary to accept public office as part of any infiltration scheme having for its object the substitution of some new or different form of government for our Federal Constitution without the consent of the people.

RESOLUTION REGARDING SUPPORT OF PUBLIC-
SCHOOL SYSTEM

Resolved, That we do hereby declare that we strongly support the public-school system and we recognize the absolute necessity for such a system, as an effective agency to support constitutional government and to make our Government workable in practice. As evidence of our support and fundamental belief in that system, we have, in recent

years sought to expose and eliminate the subversive practices which have in some instances injured that system and have attempted to convert it into a potential danger to the American people. We believe in the fundamental integrity of the average teacher. We are convinced that many of our teachers are misinformed and misrepresented by those who seek to dominate and control the public-school system, and that the teachers themselves will institute reforms once the facts are brought out into the open.

Miss Peggy Cannon's Work in the Battle Against Disease in Thailand

EXTENSION OF REMARKS

OF

HON. HERBERT H. LEHMAN

OF NEW YORK

IN THE SENATE OF THE UNITED STATES

Tuesday, October 2, 1951

Mr. LEHMAN. Mr. President, the World Health Organization, affiliated with the United Nations, issues a fine news letter which contains many interesting notes on what is being done by international effort to advance and protect the health of the peoples of the world, especially in the underdeveloped areas.

The August-September issue of this news letter carried a very interesting and well-written report describing one of these projects in Thailand. I ask unanimous consent to insert this article on the battle against disease in Thailand in the Appendix of the Record.

There being no objection, the article was ordered to be printed in the Record, as follows:

AN IRISH BROGUE IN THAILAND

(A report by Brian R. O'Brien, information officer for UNICEF Far East Headquarters, Bangkok)

In the remote northeast of Thailand, less than 100 miles from the Burmese border, is a rice bowl ringed by mountains. In this sheltered plain lies Chiangmai, chief town of the province of that name. There is an air about Chiangmai, a feeling that this is a land apart.

Perhaps it is its isolation, or maybe it is the many trees which stand their ground against the encroaching rice fields. Perhaps it is the hill of Doi Su Dhep with its mountain streams and many lacy waterfalls. In this dreamy Shangri-la you will find a people, kindly, smiling, and ingenuous almost beyond belief.

Closer acquaintance, though, would let you know that they have their troubles, from the dread malaria and other insect-borne diseases that plague the area. You would find out, too, that they have their worries about their children, for all too many of them die. So do many mothers bringing the children into the world.

That something can be done to prevent this loss of life, and the ill health of which those high mortality rates are only a reflection, is knowledge that is now being brought to the people of Chiangmai. A nurse from Ireland, straight from the hills of Donegan, is having an important part in that work.

MALARIA CONTROL AIDED BY WHO/UNICEF

She is Miss Peggy Cannon, who for more than a year now, has been in Chiangmai in connection with a malaria-control demon-

stration being carried on by the Thai Government with the help of two United Nations agencies, the International Children's Emergency Fund (UNICEF) and the World Health Organization (WHO). While teams travel from village to village spraying the habitations with UNICEF-supplied DDT, Nurse Cannon works with the women and children.

Her work means home visiting, conducting mother and child health clinics, supervising village midwives, and caring for the health of school children. Another assignment is to teach pupil nurses public health nursing.

A visit with Miss Cannon to a village clinic in the Chiangmai area is an enlightening experience. In some places the Government has erected buildings, but in most villages, clinics are held in any convenient place that will give shelter from the sun. Sometimes the tall trees of the forest lend their shade, at other times it may be necessary to assemble underneath the headman's house. Buffaloes with high scythe-like horns stand placidly by. Orchids cascade from the palms.

CLINIC FOR MOTHERS AND CHILDREN

The people arrive usually well ahead of time and wait patiently for attention. The children, impressed by the occasion, sit quietly on their heels like so many bronze images. A young mother holds her baby close. Obviously if it does not soon get attention it will die. On a rough bench is a basin of water, a towel, some soap, hypodermic needles and a small bottle of lymph. Water in an iron pot is being boiled for sterilizing purposes over a small Chinese oven. The clinic begins. Medicines are given or prescribed. Some are advised to go to hospitals while others are treated on the spot.

"How many babies for vaccination?" asks Miss Cannon.

The interpreter replies, "Ten."

Miss Cannon busies herself with needles and vaccines.

"I see the teacher's twins are here today," comments the interpreter.

"How is their weight?" asks Miss Cannon.

The interpreter looks at the record. "No gain since last check."

"Is she continuing the whole-milk formula?"

"Yes."

"Ask her about the vitamins. They should be getting C and D."

The interpreter duly inquires. "They're not getting their vitamins," is the reply.

"Tell her the children require them, particularly the one that's just had pneumonia."

Miss Cannon scrubs her hands while the mothers form a queue to have their children vaccinated.

"Everything is ready," announces the assistant.

"All right, Miss Aunchan. I'll prepare the skin. You do the vaccinating."

So the work is done.

MILK PROVIDED BY UNICEF

"When we started work here," relates Miss Cannon, "we discovered that most of the mothers considered it necessary to feed the baby only three times a day. Now we encourage the mor tam-yaes to let the mother breast-feed the baby 6 to 8 hours after delivery, and from then on every 3 or 4 hours, depending on the size of the infant. We encourage all new mothers, expectant mothers, and children over 12 months to take skim milk. Whole milk, which, like the skim, is provided by UNICEF, is distributed at the clinic by the public health nurse to babies under 12 months who require supplementary feeding or who, for one reason or another, cannot be breast-fed. Milk is an unknown food here, however, and its introduction will take time. Some mothers take it regularly; others will not drink it."

The mor tam-yaes are very ready to learn, and attendances at the monthly clinics are excellent. One old lady of 74 has never missed a clinic since they started.

CLASSES FOR VILLAGE MIDWIVES

There they learn not to feed the babies rice or bananas until they are at least 5 months old. They learn not to bathe a newly born baby in cold water, but to use warm water only. They learn cleanliness and simple asepsis. They learn not to interfere with the normal course of delivery, but to call for help if anything goes wrong.

Old practices and customs, if there is no harm in them, are respected. For instance, in some places, after the birth of a child, the placenta in the case of a boy is buried in the garden so that he will grow up to be a good worker and till the soil. In the case of a girl the placenta is buried at the gate of the house so that the girl will grow up to be hospitable and so get herself a husband.

Home visiting is one of the most useful and satisfying parts of Miss Cannon's work. This rural work for nurses is something entirely new to Thailand. First visits find the people shy. The children scuttle away into the forest and peep behind the tree trunks like little gnomes. But before many days have passed they are coming out to meet her and clinging to her skirts with obvious affection, and their parents, too, have a warm welcome for her. There are rapid conversations which need no interpreter.

FIRST NEED IS TRAINED PERSONNEL

A most important part of Nurse Cannon's work, though, is not what she herself does, but the help she is giving so that others can carry on in her place. Such is the purpose of her being here in Thailand, and others like her being in the other countries of South East Asia, for their work is part of a large effort being made in these countries to build up elementary services for women and children. A first need is for trained men and women, like the mor tam-yaes to work among the people, for until such people are trained other plans must remain on paper. The governments of these Asian countries are trying to meet that need, and to that end they are asking for, and receiving, help from WHO and UNICEF. The World Health Organization provides the technical knowledge, UNICEF the "tools"—dried skim or whole milk, mid-wifery kits, medical equipment and supplies, and the like needed to get the work started. It is a down-to-earth type of international assistance, undramatic perhaps, but far-reaching. And it involves many Nurse Cannons and their counterparts in the villages and towns of all of South East Asia.

One County Contributes \$60,000,000

EXTENSION OF REMARKS

OF

HON. T. MILLET HAND

OF NEW JERSEY

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. HAND. Mr. Speaker, the Ham-monton (N. J.) News points out that Atlantic County alone will contribute more than \$60,000,000 toward the current Federal budget. It is useful that the people back home should know about these costs. The editorial follows:

Taxpayers of Atlantic County will contribute \$60,382,000 toward the \$68,400,000,000 which the Federal Government aims to spend by the end of the current fiscal year June 30, 1952, the New Jersey Citizens Committee for the Hoover report estimate.

The county figure is based on a per capita apportionment of \$2,156,884.192 estimated as New Jersey's proportionate share of the pro-

jected Federal spending. The \$68,400,000,000 figure is the estimate of Budget Bureau Director Frederick J. Lawton, made during a recent interview in Washington.

At that taxpayers will be asked to contribute even more than the figure indicated. Appropriation bills, yet to be passed by Congress, may go as high as \$100,000,000,000—far and away a record for peacetime Government spending. Thus, Government bureaus will have to step up their spending to keep pace with appropriations.

New Jersey taxpayers still have a chance to have their say on the astronomical spending program, by writing to their Congressmen urging support of the 20-point Hoover economy program which was introduced in Congress last spring.

To date, Congress has given only token attention to the program, which is based on the detailed recommendations for governmental efficiency, streamlining, and economy made several years ago by the bipartisan Hoover Commission. If the legislation were enacted it would not only save nearly \$10,000,000,000 now wasted annually but would serve notice on the Government that the folks back home still have a watchful eye on the purse strings.

Pack of Lies?

EXTENSION OF REMARKS

OF

HON. ANGIER L. GOODWIN

OF MASSACHUSETTS

IN THE HOUSE OF REPRESENTATIVES

Thursday, September 27, 1951

Mr. GOODWIN. Mr. Speaker, those of us who have consistently urged the adoption of the remaining recommendations of the Hoover Commission cannot be blamed for feeling that it is perhaps a futile endeavor in view of the apparent lack of interest on the part of the President. The need for stopping unnecessary Government spending, however, becomes more urgent day by day. Bearing on this vital problem is an excellent editorial from the Melrose (Mass.) Free Press of September 27, 1951, and I append it hereto under leave to extend my remarks:

PACK OF LIES

President Truman has strongly defended his proposed Federal budget, contending that no major cuts can be made in any part of it without endangering the welfare of the Nation. In a recent speech the President took his most aggressive position yet, when he stated that charges of waste and extravagance in the Federal establishment amount to a "pack of lies."

The President has every right to his views. But if he is correct in this instance, the country certainly is full of "packs of lies," and they abound in the Democratic as well as the Republican Party. Senator BYRD, for instance, holds—and substantiates his position with masses of facts and figures—that the budget could be reduced by something like \$8,000,000,000 without harming any essential government activity. Senator Douglas has waged a gallant but losing battle against pork-barrel spending which cannot be defended except on vote-seeking political grounds. The Hoover Commission, which was entirely nonpartisan, showed precisely where billions are being wasted in the administration of the Government. Only a few of the Hoover Commission recommendations have been adopted and those

that have been are of a relatively minor character.

The President's stand is logical only if we assume that centralized government must do everything for everybody. In essence, this assumption says that the people are incapable of taking care of themselves, and that, consequently, they must be wards of the state. That is a philosophy of defeat and despair, and no nation could accept it and retain its strength and freedom.

Unbridled government spending is a cancer that can destroy the richest nation.

More Powerful Than the A-Bomb

EXTENSION OF REMARKS

OF

HON. GEORGE M. RHODES

OF PENNSYLVANIA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. RHODES. Mr. Speaker, under leave to extend my remarks, I include herewith an article by Mr. Ralph J. Bunche, in the Progressive magazine, a publication founded by former Senator Robert M. La Follette.

Mr. Bunche is Director of the Department of Trusteeship of the United Nations and is one of the most celebrated American figures in world affairs. Best known for his successful mediation in Palestine conflict he has performed a host of less widely known services in the cause of peace and international understanding. The article is adapted from a talk Dr. Bunche gave at the World Affairs Institute at the University of Denver recently:

MORE POWERFUL THAN THE A-BOMB

(By Ralph J. Bunche)

It would take great prophetic power to predict how the two great issues of our time—freedom and peace—will be resolved. The only prediction any of us in the United Nations can make with certainty is that the world will be gravely troubled so long as deep fear and suspicion persist among its peoples, and so long as governments succumb to aggressive ambitions.

If the future is unclear, the present is not. The world of today is drifting dangerously. In it both peace and freedom seem clear-cut and decisive to Americans. We regard freedom as something well-defined government of, for, and by the people, the inalienable rights of man, the dignity of the individual; freedom of speech, press, and conscience, the right to boo the umpire and the President alike—we indulge as abundantly in one as the other. To us, the issue of peace or war is also simply defined. War, we contend, is something which can only be forced upon us by direct threat to our national security.

It is imperative that we in America realize that these same issues are by no means so well defined in the thinking of many other peoples in the world. It is important for us to bear in mind that vast millions of people—indeed, most of the world's peoples—have had little or no familiarity with the concepts of freedom to which we in America are dedicated.

This is no mere question of peoples and concepts of the West as against peoples and concepts of the East. The issue of human freedom covers the globe. In varying degrees of intensity, it is to be found in Asia, Africa, the Middle East, Latin America, the Caribbean, Western Europe, and in some aspects at least, it is as yet unresolved even in our

own country. We ourselves have still much to do in the development of our freedom. We have bigotries to eradicate, undemocratic limitations on suffrage to abolish, poverty, and insecurity for many of our citizens to eliminate.

The issue of human freedom, to be sure, is implicit in the desperate ideological conflict between western democracy and communism, but it is by no means confined to that conflict, nor would the resolution of that conflict find the issue of world freedom resolved. In this sense, the impasse between west and east often leads us to oversimplify grossly the universal problem of human freedom.

We speak glibly these days of the "free peoples" and the "free world," and in doing so we not unnaturally think in terms of our own freedoms. But in actual fact, many among those who are allied with us or whom we hope to have allied with us, against the Communist threat, would not measure up at all as "free" by our standards of freedom. To a considerable extent, what we really mean by the "free world" or the "free peoples" are those who are opposed to communism and aggression, rather than peoples who are actually "free."

Taken in this sense, one of the most serious weaknesses of the "free world" is to be found in the fact that so many of its peoples are not really free and do not enjoy those fundamental rights and freedoms which inspire peoples voluntarily to make heroic sacrifices for their heritage of freedom, or, for that matter, to understand clearly the essential issues between democracy and communism.

In this regard, the Western World today pays dearly for some of its unfortunate policies of the past. The concepts and practices of freedom and democracy have been cultivated primarily as western notions and assets, and have in the past been withheld from or only grudgingly conceded to peoples elsewhere in the world. Freedom and democracy were not in the past generously exported by most of the colonial-minded, imperialistic west, and consequently the millions of Asia and Africa have lagged far behind in the development of human freedom and democratic institutions of government, as they lag far behind in the material standards of life.

In other words, freedom heretofore has been too much confined to an exclusive group of societies, the dominant and favored few of the world. But now, the western concept of freedom is everywhere challenged and threatened by the Communist creed. It can be preserved for those of us who enjoy it only by the widest possible mobilization of those who believe in it. To believe in freedom, people must have some knowledge and understanding of it, and this can come only from experience with it. Recruits for freedom—and they are desperately needed—can be won only by the widest extension of freedom.

It should be obvious that the free peoples of the world, in the protection of their own freedom, must exert every effort to rectify the errors of the past.

They should embark upon a universal crusade for the extension of maximum freedom to all peoples.

They should carry the gospel of freedom to the most remote corners of the earth.

They should seek the rapid dissolution of colonialism.

They should give encouragement and substantial material support to the development of free institutions among every people they can reach.

No such concerted effort is today being made by free nations and peoples. There is much lip service to freedom which is counteracted by a disposition to hold firm to many of the outmoded notions and attitudes of the past regarding peoples long treated as backward.

The west has not sufficiently sensed the revolutionary ferment in process all over the world, and has not fully realized that the old tempo of human progress, the traditional gradualism, is far too slow for peoples who have for so long known only misery and repression, and who have been shocked into a new awareness and aspirations by the two World Wars.

We must never forget that the most vital issue is the peoples of the world—their progressive well-being, the realization of their aspirations, their changing attitudes, and the way of life they may choose or may have forced upon them.

The preponderance of the world's population is found in Asia and Africa. These vast millions, on whom the eyes of an anxious world are now focused, are not really "backward" or inferior or different, they have been and largely still are neglected, suppressed, long-suffering, and miserable.

But they have awakened or are rapidly awakening. Revolutions are in progress among them. They seek freedom and a better life—education, housing, health protection, security. All this has little or nothing to do with communism or any other ideology.

These revolutions cannot be stopped, nor can they be slowed down. The fateful questions are two:

Will the revolutions be violent, or can they be achieved without bloodshed as the United Nations strives for?

Will the revolutions lead into democratic or totalitarian channels?

The western democratic and freedom-loving world can do much to determine the answers to these questions. But the sands are running fast.

To do so, the West must quickly accommodate itself to a new orientation. Peace in the world must be paced by human progress, by equality and dignity for all peoples. The west must learn how to approach the Asiatic and African peoples understandingly and how to win their trust and friendship.

We in the west must realize that despite the undoubted benefits which the west has brought to these formerly far-off lands, there is a long and unsavory history of western imperialism, suppression, and exploitation to be overcome. It will not suffice to offer them only our sophisticated concepts of "western democracy."

Our ideals and professions will have significance in this world-wide struggle only as they find concrete expression in policies and deeds. We must demonstrate our sincerity with regard to the principle of the equality of all peoples by accepting and treating all peoples as equals. We must prove our friendship by extending to them a friendly, not a paternalistic, hand.

In that hand must be many of the things they have so long lacked and now desperately seek, and with no strings attached—technical assistance of many kinds, friendly advice, goods, mechanical equipment, medical supplies, foodstuffs, and assurance that they can have freedom and be secure in it if they will but join with those who stand for peace and freedom.

This will be costly, to be sure, but a tremendous program could be supported for the cost of only a short period of warfare in Korea or anywhere else. Freedom is worth any cost.

I trust that I may be pardoned for noting that my own group, the American Negro, has an especially acute concern for human freedom.

Despite the substantial progress made since the end of slavery the Negro has not yet won his full freedom in this society. Four score and eight years after the great emancipation he is still burdened with undemocratic and un-American restrictions and handicaps, with racial discriminations

and indignities which deny to him that full measure of freedom which is the rightful heritage of every American.

II

I am an American but I am also a Negro; I am proud to be both. Inevitably, as a Negro, I have had no little experience with racial handicaps, rebuffs, discriminations, and indignities, not a few of which were encountered in the capital of the greatest democracy on earth. But I have also had more than one man's share of good fortune. I believe in my country and the American way of life. I have a deep faith in its future and in its ability to correct the undemocratic practices which persist.

It is easy for me to be a good and loyal American. There are great numbers of my race who can lay far better claim than I to unselfish devotion to our country. I think, for example, of the Negro soldier in the hazardous foxholes of Korea, fighting and dying for your future and mine, for security and freedom for you and me that he has never himself enjoyed in full measure at home, solely because his skin is black. This is Americanism at its finest and should put to shame the racial bigots and those small men who, with loud irresponsibility, parade about the country as self-appointed guardians of Americans and Americanism, sowing vicious crops of suspicion, mistrust, confusion, and loss of faith in our democratic institutions.

In this dangerous age it is not enough to have and enjoy freedom. Those who are privileged to enjoy it have the obligation to use it wisely and responsibly. This holds particularly true for Americans because of our heavy responsibilities of leadership, and because the eyes of so many peoples the world over are intently focused upon us. In the end, it is how we use our freedom that will count most heavily.

On this score, we have much to be concerned about at home. There are some within the society, more vociferous than numerous, who, for reasons of hysteria or from more sinister motivations, would take advantage of the deep anxiety induced by the world crisis to stifle independence of thought and the right of criticism, to restrict and circumscribe our traditional rights and freedoms, and generally to invoke a reign of suspicion, terror, and intimidation not unfamiliar to Nazi Germany.

In such soil freedom would quickly wither away. The objectives and tactics of the handful of internal Communists are now well known and are readily identified. We are, perhaps, less well prepared to identify and deal with neofascists in our midst. They, too, threaten our liberties. It took great sacrifice and unrivaled courage to win our American freedom. It will take great sacrifice and unceasing vigilance to preserve it today.

It is because I believe that the American way of life—for all the shortcomings and imperfections of our society—is the best blueprint yet devised for dignified living among free and self-respecting men that I am deeply disturbed at some of the signs of our times. These are signs of American conduct that weaken and divide us as a people and undermine our traditional liberties.

There are demagogues busily at work misleading the people with half-truths and purposeful falsehoods. There are radio commentators and newspaper columnists who concentrate on pouring forth venom and lies with the apparently deliberate purpose of misleading and confusing the public, and breaking down their faith. There are character assassins at work who respect not even those public servants whose lives have been fully dedicated to the Nation.

We see partisanship running hog wild. For some, freedom is only a convenient vehicle in the service of selfish individual political or economic ends. It seems to me that

there are too many people in high as well as low places who are using our traditional freedom to serve their selfish ends without regard for the well-being of the Nation.

III

Some of those who proclaim most loudly and frequently their concern for Americanism and the security of the Nation serve it least. They do us much damage at home and abroad. Our future will be in most serious jeopardy if our principles, high moral values, and our ideals are to be sacrificed on the altar of petty partisanship by petty men.

Moreover, it is impossible to calculate the damage done to our cause throughout the world by evidences of violent racial intolerance like the recent sordid episode in Cicero, Ill. These incidents make more virulent propaganda against us than any enemy could possibly invent. We cannot ever explain such deeds to those nonwhite peoples who constitute the great majority of the world's population and whose confidence and friendship we seek and need.

The world crisis calls us to a firm rededication to the ideals and moral values that have made us free and great. We need men who are national patriots before they are party partisans. We need men of courage who will stand forth as true partisans of freedom, equality, and democracy. We need men who will hold country above party.

I have mentioned the issue of peace or war. We in America have our liberty, our superior standard of living; for us, war is a last resort in the defense of our security and freedom. We would fight again to protect our heritage. But there are other peoples in the world who seek the freedom they do not now enjoy and who, if no alternative is left to them, will fight to achieve it even as we fought for our own 175 years ago.

We have witnessed such determination recently in Southeast Asia and the Near East. There are ominous rumblings of similarly burgeoning nationalism in Africa. Peoples, otherwise peace-loving, will wage war for their freedom. But today, every war, no matter how small and local, poses a threat to the peace of the world. Peace can never be secure in the world until peoples who aspire to freedom may be assured of it without recourse to violence.

The universal struggle for human freedom can be won. But war is no longer the way to win it, either for those who have it or for those who seek it. Peace and freedom in the world are closely allied. Victory in war for the free world, in eliminating one threat to freedom, would inevitably set freedom back everywhere, would leave the basic problem unresolved, and would create conditions which could only beget further war.

There can be peace in the world. But it can be achieved only through the resolute application of collective security. It is folly in this age to speak of any nation saving the peace or protecting its security by unilateral action.

The principle of collective security is neither mystery nor plot. Every man in the street knows well enough that if one faces the prospect of a fight it is both comforting and good sense to be accompanied by friends. That is precisely the purpose of collective security—it draws together in a bond of common purpose, in the interest of their own security, all nations and peoples who are opposed to armed aggression and who are prepared to oppose it with force if necessary. It was necessary in Korea, and collective security is at work there, more promisingly today than at any time since the North Korean forces launched the aggression against the Republic of Korea in June 1950.

The successful U. N. intervention in Korea may well prove to be the decisive event in our times. Those voices which speak of the uselessness of the Korean action speak falsely. They deliberately ignore the highly signifi-

cant fact that the Korean decision was the first instance in history of collective police action to repel aggression. They avoid the vital truth that Korea sounded the harsh alarm for the free world and purchased invaluable time in which free peoples might mobilize their strength. Korea has demonstrated the immense potentiality of collective action by peoples whose sights are true. It has provided a most solemn warning to all would-be aggressors of the future.

If the lessons of Korea are learned well and if nations will but take the preventive actions which these lessons demand, there can be an end to aggression in the world and an era of far greater security for all peoples.

But collective security is a means, not an end. It can be no more effective than the firm determination of nations and peoples will make it. As Secretary of State Acheson has recently written: "Collective security is like a bank account. It is kept alive by the resources which are put into it."

We must realize that peace cannot be cheaply or quickly won. It is only by patient, unrelenting, and undismayed effort that secure peace can be achieved. There are no easy roads to peace, no short cuts or pat solutions.

Nor can there be any question of peace at the price of appeasement, or surrender of fundamental principle. Peace, clearly, cannot be won in this way. But, on the other hand, neither can peace be won by threatening war, by sword-rattling, or intangence. The tried and true and fully honorable instrument in the conduct of international affairs is negotiation. The settlement of international disputes by negotiation and compromise is a difficult and tedious, and, today particularly, a frustrating process. But the dividend is peace.

There can be no doubt that the American people seek peace. They would not, to be sure, take peace at any price, at the fatal cost of appeasement. But given any honorable alternative to war they will welcome it enthusiastically.

Nevertheless, there are voices among us today which speak loosely and lightly of war. They do not reflect the American desire for peace, and, indeed, they seem to imply that it is an evidence of weakness to strive for peace. There are some who talk as though the only relevant question concerning our going to war is whether we can be certain to win it. We hear some who boast of our ability to defeat any enemy and who seem to regret that we are not hastening to do so.

If I understand them correctly, there are some Americans today who would have us conduct our foreign affairs on the juvenile basis of drawing lines, issuing dares, and swaggering about with an atomic chip on the shoulder, crying aloud that we can lick anybody.

We are a great Nation with tremendous responsibilities of leadership to discharge. In this threatening hour we must be strong, but our strength must consist of more than arms and production lines and armies of fighting men, indispensable as these are. Our effective strength must depend also upon great wisdom and understanding and upon an unimpeachable moral position.

IV

To meet the challenge confronting us, we shall find restraint, composure, and cool calculation indispensable. We shall dissipate our strength or we lose sight of the fact that a weapon of even greater effectiveness than the atom bomb is the strong appeal of peace to the peoples of the world.

A fundamental issue in the world today, as it has been for centuries, continues to be the fate of human freedom. It must become increasingly clear to all, if there are any who really ever doubted it, that peace in the world can be fully secure only when there

is universal human freedom, when men as individuals are free to go and come; to speak, think, worship, assemble, and associate freely; to earn their daily bread, and enough of it, by voluntary labor; to feel secure and without fear in their daily lives; when every man, whatever his race or color or creed, whatever his culture or origin, can walk with full dignity and on a plane of equality with all other men.

Soil Conservation Progress—Part I

EXTENSION OF REMARKS

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following address by H. H. Bennett, Chief, United States Soil Conservation Service, Pennsylvania Teachers' Laboratory, State College, Pa., July 15, 1950:

SOIL CONSERVATION PROGRESS

It always gives me great satisfaction to have the opportunity of talking about soil and water conservation with people who are sincerely interested in helping to solve the problem, as you so obviously are.

Being engaged in the educational side of the matter, you are naturally concerned with the solid facts and figures relating to the conservation of our natural resources and the job of making the wisest possible use of them. As a practical soil conservationist, I likewise am concerned with the facts—not with theories, guesswork, halfway jobs, or the representations of those who howl about duplication and forget about cooperation.

One of the things needed at this crucial stage of our national life, it seems to me, is more of what you are doing here in this Teachers' Laboratory: cooperating with one another and preparing people to help with the solution of our national problems.

There are some, perhaps, who feel that only farmers need be interested in the problem of soil conservation—the biggest of all our problems, in my opinion. It's my conviction we should all be very deeply interested in this stupendous job of soil defense, whatever our occupation or wherever we live. Soil defense is an indispensable part of our first line of national defense. Stout soldiers with guns and shells, and ships and planes, are an indispensable part of that first line of defense, too. The two are mutually sustaining, as everyone knows.

And farming according to modern soil conservation methods is not limited in its effects and benefits just to the farms on which such methods are practiced. It is closely related to the profitability of industry, the well-being of municipalities, and the health and welfare of all the people.

I believe I can say that our national policy and public thinking, with few exceptions, are agreed on the utter necessity of conserving and making productive use of our interlocking resources of land, water, forest, grass, cultivated crops, and wildlife. Research, education, land inventories, and the successful use and profitable results of soil conservation have brought us to this new concept of the importance of land and, also, of the need for keeping the land permanently productive. The practical application of this concept is being demonstrated on a progressively wider scale from year to year all over the country by farmers in soil conservation districts. These farmers, in the finest spirit of coopera-

tion, are striking effectively at the root of the evil. Those of us in the Soil Conservation Service are proud to have been asked to help the districts with technical assistance. By enlisting the cooperative efforts of landholders, government and the public, working together, are demonstrating their special adaptability for getting conservation accomplished.

PRODUCTIVE LAND'S IMPORTANCE IN OUR ECONOMY

It would be most convenient for the rest of us if we could pass all the responsibility for soil conservation back to the farmer—the Pennsylvania tobacco grower, the Iowa corn farmer, the Kansas wheat producer, the Texas cattleman, or the Alabama cotton planter—and let the matter rest there. But our economy isn't built that way. The land is still the source of a very large share of our original wealth. Manufacturers, bankers, merchants, doctors, teachers, ministers, writers, and all the rest of us, in Philadelphia, Atlanta, Dallas, San Francisco, are directly affected by what happens to our productive land which is the base of our national vigor and welfare.

We are affected, basically, as consumers of the things that are produced from the land; and we are affected, too, with respect to our income. Some of us are doubtless affected through the effect of poor land on the nutritional value of food.

The importance of productive land in our economy hardly can be overemphasized. A suit of clothes or a pair of shoes is manufactured in Pittsburgh or St. Louis, but the wool or leather which goes into the finished product may have been produced on a western ranch, more than a thousand miles away. And many people, beginning with the rancher himself, are dependent wholly or partly for their income—their living—on the processes involved in getting that suit of clothes or pair of shoes into your clothes closet or mine. There are railroad men and truckers, weavers, leather workers, advertising men, stenographers, bankers, package manufacturers, salesmen, wholesalers, retailers, and many more. I hardly need to go into further detail because the same situation is true of every package of bacon, piece of furniture, or the many other soil-produced items processed or manufactured by the great industrial plants of the Nation. These producers, processors and distributors are, in turn, buyers of goods and services on their own account. They patronize doctors, dentists, lawyers, garden supply shops, and nurseries, barber shops and beauty parlors. They go to the movies and ball games. They buy houses, automobiles, radios, television sets, newspapers, electric irons, and light bulbs. They ride in Pullman cars. They hunt and fish, play golf, and take pictures. Their taxes help build roads and bridges, schools and hospitals, ships and airplanes.

AMOUNT OF PRODUCTIVE LAND IS LIMITED

So it is that every interest in the country has a stake in getting the quickest possible solution to this problem of safeguarding our remaining limited supply of productive land—which is the source of all but a small fraction of our food, as well as of all our wood products.

Although we in this country are not in danger of going hungry any time soon because of our land's running out, the amount of productive land we have left is much more limited than is commonly supposed, and the supply is still shrinking. We have left in the United States as a whole only about 460,000,000 acres of good, first-class land, counting all the good land that is in cultivation now and all that can be brought into profitable cultivation by presently feasible means. In recent years, we have been using for crop production and rotational pasture around three hundred and fifty to four hundred million acres annually. Something like 70,000,000 acres of this

farmed area, however, is unfavorable for use as cropland and should be diverted permanently to grass or trees. All but about 100,000,000 acres of the 460,000,000 acres of good, productive land, in use or available, is, or would be without protection, susceptible to severe damage by erosion, waterlogging, floods, accumulation of alkali.

Our land capability survey indicates that more than 47 percent of Pennsylvania's land falls in classes I, II, and III—land which is suitable for continuous cultivation, with careful conservation treatment of classes II and III lands. Nine percent consists of class IV, a borderline type which can be cultivated safely only occasionally; and about 29 percent consists of land of classes V, VI, and VII, suited only for growing trees or grass. Class VIII land, the only other class, is useful for wildlife and recreation.

Erosion, according to our soil-conservation surveys, has been severe on about 430,000 acres of Pennsylvania's farmland and serious on some 14,275,000 acres. Altogether, 51 percent of all the land in the State has been seriously or severely damaged (and this is more than half of the State's farmland). Pennsylvania is not as bad off in this respect as some of the other States, but the problem, nevertheless is quite serious enough.

DOING SOMETHING ABOUT LAND WASTAGE

Because eroded land is scattered around the country in many thousands of parcels—a gullied field here, a sheet-eroded slope there—many people are inclined to overlook what is happening to our productive land, and to discount its importance because they can't visualize the enormity of the damage. There are too many details for summarization through "picture windows."

But with good land, like some of yours, worth \$125 an acre or more, 14,700,000 acres seriously or severely damaged brings the cost of erosion, if we assume only \$65 per acre damage to the land, to nearly a billion dollars worth of Pennsylvania farmland wastefully depreciated. And, of course, the cost, in the absence of effective soil conservation, goes on in some measure year after year.

What would happen, I wonder, if anything like that kind of preventable damage and depreciation were eating away at your industrial plants and stores, your machinery, buildings, railways, and so on? You would do something about it—that's what would happen most certainly, especially if the damage should get worse and spread more and more, like erosion damage does with every rain, where the land is not protected.

And for precisely the same reason—because it's good business to protect and prolong the productive life of the productive land on which our biggest and most basic business, our agriculture, depends—we are doing something to halt the dissipation of our irreplaceable soil. We are doing it—State-wide, Nation-wide, community by community, farm by farm, acre by acre (of entire farms)—through modern soil conservation farming.

Today you will find this relatively new but already tried and proved kind of farming in constantly wider use as far as United States land extends in any direction. I have reference to the soil and water conservation farming which landholders of the Nation are carrying on themselves through their farmer-organized and farmer-managed soil conservation districts, with the technical help of the Soil Conservation Service and the support and assistance they draw from various other sources, governmental and private. And now some other countries also are adopting this conservation pattern in their agriculture, with soil conservation districts to help—as in the Union of South Africa, Mexico, and some of the countries of Australia.

WHAT MODERN SOIL CONSERVATION IS

Before we discuss the subject any further, I think we should stop a moment to examine the meaning of modern soil conservation:

Modern soil conservation consists of the kind of sound land use and protection needed to keep the land permanently productive while in use.

It means contouring and terracing land that needs such treatment, and strip-cropping and stubble-mulching the land as needed, along with supporting practices of crop rotations, cover crops, green-manuring crops, etc., wherever needed. It means gully control, stabilizing water outlets, building farm ponds, locating farm roads and fences as nearly on the contour as practicable, planting steep, erodible land to grass or trees, development of good pastures, and devoting good management to them after they have been developed.

Where land is too wet, modern soil conservation calls, moreover, for drainage, with full consideration given to wildlife needs. If it is too dry it calls for irrigation; if subject to wind erosion, it calls for wind-tripping, tree planting, growing cover crops, and stubble-mulch farming. If plant nutrients, lime, and the humus supply of the soil have been depleted, it calls for fertilization and addition of lime and organic matter. If water-soluble salts have accumulated in toxic quantities (alkali), as in parts of the West, it calls for both drainage and leaching out of the salts by flooding. And modern soil conservation calls also for the use of the best of the most adaptable varieties of crops as well as the most efficient of available adaptable tools.

Modern soil conservation likewise calls for flood control and reservoir protection (municipal and other kinds) by treatment of whole watersheds with the right combinations of practices, land use, and small structures in the smaller, upper watersheds where floodwaters start. Applied at the right time and place, such watershed treatment saves soil and reduces flood and sedimentation damage, stores water in the soil for plant use and, where conditions are favorable, in the underground strata for pumping. As a part of the modern soil-conservation job, city sewage should be kept out of the streams and treated for use on the land, as some cities are now doing.

And, of course, an indispensable part of modern soil conservation is a supporting program of research, such as will provide for the welfare of the land at all times, and give farmers all the advantages that progressive science can contribute. Also, a continuing, vigorous program of soil-conservation education should be made a part of our teaching from kindergarten on through college. And, modern soil conservation calls for the maintenance of all effective work, that has a chance for permanency. Such measures are not intended to be used for just a single year or cropping season. They are the basis of land permanency and that is necessary if we are to have a permanent agriculture.

ONLY ONE CORRECT CONSERVATION FORMULA

There is only one correct formula for doing the soil and water conservation job right—regardless of what anybody may try to tell you. That formula consists of treating the different kinds of land on a farm according to their individual needs as determined by condition, and using each kind according to its capability for continued safe and economical production—whether that be for field crops, pasture, timber, or wildlife.

If there is any activity of mankind that requires the most scrupulous use of all that land science and hydraulics and agronomy can provide, it is the work of keeping our land permanently productive and making the best possible use of our water supply. There are in the neighborhood of a hundred

soil and water conservation measures now being used in the program of the Soil Conservation Service to halt erosion, conserve rainfall, and improve the land. Each measure is used, as the situation demands, to meet a definite land need or to produce a specifically desired result. Usually, combinations of several measures are essential.

A hundred years of farming experience in this country has proved definitely that no single practice, applied arbitrarily on a whole field or a farm, will control erosion and maintain soil productivity permanently, except perhaps the planting of an entire field or farm to grass or trees. And we can't live by grass and trees alone. Except where the land is used for grass or forest, single-practice soil conservation can't be successful, in the great majority of cases, because it almost always is inadequate to cope with the diverse land conditions and complicated requirements of sound land use and protection, imposed by nature. Some single practices, such as contouring, stubble-mulching, rotation, or manuring will bring some temporary benefits to entire fields or farms; but they cannot get the job done on anything approximating a permanent basis, except on the relatively small areas of the very best quality land (land of capability class I).

NO SHORT CUTS TO LASTING SOIL CONSERVATION

So I want to emphasize as strongly as I can, that there is no substitute for quality and completeness in the protection, development, improvement, and proper use and management of our land and water resources—in Pennsylvania or anywhere else. Each acre of land, as already pointed out, must be used according to its individual capabilities and treated according to its needs, because each acre of land, like each human being, is different from any other acre.

Likewise, each watershed, whether large or small, must be used and treated according to its specific physical peculiarities, if we are properly to conserve, develop, and use the water and land resources of that particular watershed—or any watershed.

If there were some simple remedy for our land and water problems that could be applied everywhere, according to a standardized treatment or formula, the job would be relatively easy. But there is no cure-all, no short cut to the solution of these problems. Nothing less will suffice than a painstaking study of each acre, each field, and each watershed, and the appropriate application of all needed conservation measures that the study indicates as necessary to get the job done right. To ignore these facts is to invite further damage to our diminishing supply of productive land, as well as to waste time, opportunity, and money for the landholder, the community, the Nation—for everybody.

Some will say: "Soil conservation must be profitable." Well, sure, it must be profitable. And it is profitable, practically without exception under normal conditions and where it's done properly and in time. Looking ahead, we cannot keep our sloping land—and the great majority of it is sloping—unless we effectively protect it. And, looking beyond that, land means food and food means strength and life.

That this method is the only possible way to ever provide adequate safeguards for our land is a physical fact devised by nature. It is one of the things we know; there's no guessing about it. It is a fact of precisely the same order as the physical fact that water will not run uphill on its own power.

As a matter of fact, we took our Soil Conservation Service program out of nature's pattern for developing and safeguarding productive land. Nature's laws were so contrived that land, water, plants, and animals (with the exception of civilized man) should—and under natural conditions do—exist in harmony and interdependence for

perpetual productiveness of our basic resources.

So, it likewise is a mandate of nature of precisely the same order that the land, and the water which makes land productive, must be treated and used according to need and capability. I am repeating this because it needs all the emphasis we can give it.

Soil Conservation Progress—Part II

EXTENSION OF REMARKS

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave granted to extend my remarks in the Record, I include the following address by H. H. Bennett, United States Soil Conservation Service, Pennsylvania Teachers' Laboratory, State College, Pa., July 15, 1950:

PROGRESS IN PENNSYLVANIA

In the spring of 1932, I was invited to give a talk at Pennsylvania State College on the subject: Is There an Erosion Problem in Pennsylvania?

Not only was there a very serious erosion problem in Pennsylvania, affecting some 15,000,000 acres of land, but there was the very serious additional problem of few people being aware of the fact and nobody doing anything about it. I don't mind confessing that some of us in Washington, including myself, and a handful of people in the State, had to do the educational work needed to arouse Pennsylvania, both to a realization of the problem and to action. About all that was being done was that an occasional farmer undertook to stop his gully erosion by dumping trash into the washes. In some localities an occasional farmer was field stripping; but at the time strip-cropping was only in process of development on the regional erosion research station. And most cultivation everywhere was up-and-down-hill. You could pretty nearly put down the amount of effort being devoted to soil conservation in Pennsylvania as close to zero.

Now there is a going soil conservation program in the State. This is improving all the time and gaining momentum. True, the district movement has not gone ahead fast enough in Pennsylvania, but in the 27 active districts work is progressing very nicely. From year to year the rate of progress is picking up, as it throughout the Nation. Nationally, in 1942, the Soil Conservation Service finished the job of treating farms according to the need and capability of the land on approximately 5,000,000 acres. In 1949 the amount of work of the same type and quality completed was 22,000,000 acres. This was a gain of 340 percent, and it was accomplished with an increase in facilities amounting to only 43 percent. (I am still talking about what even the bureaucrats can do when they cooperate wholeheartedly with farmers in soil conservation district.)

In 1942 the Service completed only 1 percent of the unfinished part of the Nation-wide soil-conservation job; but last year the annual rate of progress went up to 34 percent of the unfinished job. This year we are hoping it will go up to something above 4 percent. In 1941 only 0.6 of 1 percent of the remaining job was completed, and for the 7-year period from September 19, 1933, to December 31, 1940, we completed altogether only 1.1 percent of the unfinished total.

Some of the accomplishments in Pennsylvania, as of January 1, 1950, were 172,480

acres of contour farming, 156,807 acres of strip cropping, 88,055 acres of tree planting, 347 miles (about 5,000 acres) of terraces and diversions, 6,938 acres of farm drainage, 149,574 acres of crop rotations, and 530 farm ponds.

Now we are moving ahead better and better, partly because the cooperation we are getting in the State is steadily improving. In a period of a little over 4 years our cooperation has extended from working with 12,000 farmers in 6 soil-conservation districts to 80,000, or 46 percent, of the farmers of the State, in the 27 soil-conservation districts. That is good; but I wish we could have the whole State covered by districts by tomorrow night, so we could move still faster with the total job.

One reason why we have been able to move ahead so much faster in this State—and all the other States, too—is because of soil-conservation districts. In my opinion, the soil-conservation district is the most effective instrument for getting conservation on the land that man has yet devised, especially under the plan of local operation of the districts by local farmers who get technical assistance from the Soil Conservation Service and other types of assistance from other Federal, State, and local agencies.

NATION-WIDE PROGRESS

In soil-conservation districts alone 800,000 complete soil-conservation plans had been prepared Nation-wide by the beginning of 1950. These plans covered some 220,000,000 acres, and the area treated amounted to 112,000,000 acres—that is, for the Nation. Counting work done by the Soil Conservation Service in other programs (not including some of that in small irrigation and flood-control programs), we have completed altogether over a million farm plans. Detailed soil-conservation surveys adequate for farm planning had been completed on 322,000,000 acres, and reconnaissance soil-conservation surveys helpful in farm planning had been completed on 180,000,000 acres.

And still the big job stands ahead of us and we are still losing in the neighborhood of half a million acres of farm land annually as the result of unnecessary erosion. This much land is being annually damaged to the extent that it has little or no value for further immediate cultivation.

Certainly the soil-conservation-district movement is the greatest land movement of history. Since the first district was established in my home county of Anson County, N. C., on August 4, 1937, 2,346 other districts are in operation today (as of June 1, 1950) and they include 1,237,141,000 acres, or 81 percent of the farms in the United States.

In these soil conservation districts farmers are working together as they never have done before, and that is an asset which makes me feel confident that we are going to get the job of applying the basic conservation measures to the land, according to kind and need, done before it is too late. I am so sure of this that I can say to you today with much confidence that the job is going to be finished up to the stage of maintenance some time during the 1970's. I wish it could be done before that time, but this would be an accomplishment vastly greater than I ever expected to live long enough to see; as a matter of fact, what has been done already is vastly greater than I ever expected to see as late as 15 years ago.

COOPERATION IN PENNSYLVANIA

I think I should say something more about the fine cooperation we are getting in Pennsylvania with such agencies as the department of agriculture, the department of forests and waters, the Pennsylvania Game Commission, the Pennsylvania Department of Highways, the Pennsylvania Fish Commission, and the State soil conservation commission. All of these agencies have a men-

orandum of understanding with the State soil conservation commission.

Vocational agriculture has admirably supported the movement in the formation of soil-conservation districts in Pennsylvania and is now being considered by the State Commission for a Memorandum of Understanding to assist districts with the educational phase of the program.

I think we are over the hump and are winning the battle of soil conservation in the State of Pennsylvania. A little while ago the situation was much less favorable. Cooperation was the touchstone in this instance.

LET'S GET THE JOB COMPLETED

The main thing now is to go even faster. There are many things people like yourselves can do to help. I doubt if there is any instrument aside from soil-conservation districts that can help more to get along with the job than the public schools of this State and the Nation. I think you have a wonderful opportunity to help out with the task, and I am hoping arrangements can be made so that you can do in this connection the highly effective kind of work that you are so capable of doing. I have in mind a matter which I believe we very much need in this country to make the conservation work that is put on the land stay on the land permanently. First, of course, farmers must work together as they are doing more and more in the soil-conservation districts, and, secondly, we must get soil conservation into the bloodstream of our youth so that it will become a national habit. We may have to do some arguing to get soil conservation adequately placed in the schools, but let's go ahead with the argument and keep at it until we get the job done. There will be criticisms surely, but it will all be overcome in time. That interval will be how long it requires to educate the people properly, starting in the lower schools.

Some misinformed people will be pulling back with statements about duplication. I can assure you there is no duplication on our part of anything that went before in the program I am talking about today. If there is duplication, it has been brought about by other agencies undertaking to duplicate the work that the Soil Conservation Service was set up to do in Public Law 76, Seventy-fourth Congress, approved April 27, 1935—the first soil-conservation act for our farmlands passed by Congress—whose preamble reads as follows:

"That it is hereby recognized that the wastage of soil and moisture resources on farm, grazing, and forest lands of the Nation, resulting from soil erosion, is a menace to the national welfare and that it is hereby declared to be the policy of Congress to provide permanently for the control and prevention of soil erosion and thereby to preserve natural resources, control floods, prevent impairment of reservoirs."

We are absolutely carrying out the mandates of the Congress of the United States in our work, and if you want to read this 1935 law passed by Congress, I can get it for you. If you want to know the details of how the law was passed, who worked on it, etc., I can give you that, too. I know what we are doing and how we have been doing it, because I had a hand in setting the scene and taking part in the act for getting the job done properly and promptly. And I am very proud of the fact.

SOME MISCONCEPTIONS TO AVOID

Some will say "This is the farmers' job, let the farmers do it." Sure it is the farmers' job, and farmers are very busy at it. Soil conservation district supervisors are directing the job, and that means that the farmers themselves are the managers. The farmers in the districts and the supervisors of the districts are grass-root farmers. The supervisors are on nobody's payroll and don't act

at the behest of anyone but themselves and the farmers cooperating with the districts.

But still we must be cautious about calling it just the farmers' job. It is not just the farmers' job, it's everybody's job. Up until now one farm family has been supporting four city families. Suppose a farm family lets its soil erode to a level of productivity where it can support only three city families, then two, then one, and finally none, what happens? Probably the farmer can go ahead and make something for himself, but what happens to the four city families that he used to support?

I won't try to answer that question, except by asking another.

Assuming that conservation is the farmer's job, what happens if the farmer doesn't carry out the job? Suppose he doesn't know how, or doesn't do it quick enough? Who gets hurt? Everybody gets hurt, of course—city people first and probably more so than farm people.

Somebody said recently that you have to pay for soil conservation. What, is it that you don't have to pay for; I mean, of course, what worth-while earthly things? But this matter of saying that you have to pay for soil conservation doesn't tell the whole story. You don't really have to pay for the lasting type of soil conservation, properly applied to the land. This kind pays its way, and more.

In 1945, at the request of the Appropriations Committee of Congress, the Soil Conservation Service made a study throughout the country of the profitability of conservation farming. This was done by examining the books of farmers who had carried out a good job or soil conservation and comparing the results with those obtained on comparable farms where little or no conservation had been done. The farmers of the former group took in, on the average, \$4.90 per acre more than the nonconservation farmers.

With this figure and other farmer results serving as the basis of computation, the indications are that soil conservation is putting back into the Federal Treasury much more than the money that is being taken out of the Treasury to do the job. The Treasury funds are used to pay the salaries of our technicians and other personnel, but the entire amount was returned as increased income taxes during a recent year, plus a dividend of 78 percent. In other words, we spent \$39,000,000 that year on the soil- and water-conservation job, but our study indicated that this \$39,000,000 later on went back into the Federal Treasury in increased income taxes, plus thirty million more as profit.

Soil conservation increases per acre yields (from around 30 to 100 percent, probably); and per acre yield is the basis of farm profitability, whether prices are up or down.

There are certain misconceptions about soil conservation that still seem to confuse the thinking of a few people. We need to be on guard against such misinformation, as the following:

1 That soil conservation is of secondary importance, has already been taken care of, or can be postponed.

2 That there are short cuts to conservation, or that farmers can or should do all the necessary conservation work without technical assistance.

3 That soil conservation costs more than it is worth, and that dollar-and-cents considerations are all that are at stake.

4 That we have all the good land we need, and that soil erosion is an inevitable part of nature's scheme.

All that one needs to do to clear one's thinking with respect to these notions is to look about the country or to visit some of the other countries of the world. In various parts of the world one can see the refutation of such specious reasoning written on the eroded and unproductive country-

side, and etched on the worried faces of people struggling to produce their food and other bare necessities on erosion-worn land.

I spent some time last fall studying erosion conditions and soil and water conservation methods in southern France, Italy, and North Africa. Over there, I observed the lengths that people go in order to get a living from some of the world's oldest lands still in agricultural use. The work required in establishing some of their steep-slope bench-type of agriculture, supported with stone walls, translated into our American labor costs probably would amount in many instances to \$15,000 or \$20,000 an acre. Such an outlay on farm land clearly is out of the question for us, in the practical sense at any rate, now or at any time we can foresee, even in the most eroded parts of the country. Nevertheless, we are using bench terraces in Puerto Rico—but with grass-supported walls rather than expensive rock-supported walls. As a matter of fact, we are not in need of the stone-wall type of conservation at this stage of our development, except in occasional very special cases. We can now produce with modern soil conservation around twice as much per acre as we were producing prior to the present era of soil conservation, which began 20 years ago.

So, we definitely are getting ahead with the soil-conservation job in this country.

Comment on Address Delivered by Hon. William E. Jenner, of Indiana, on the Tax Bill

EXTENSION OF REMARKS OF HON. EVERETT M. DIRKSEN OF ILLINOIS

IN THE SENATE OF THE UNITED STATES
Tuesday, October 2, 1951

Mr. DIRKSEN. Mr. President, I ask unanimous consent to insert in the Appendix of the RECORD a comment on the speech which the Senator from Indiana [Mr. JENNER] delivered on the Senate floor on September 24. The comment appeared in the Joe Ball Washington Letter of September 29, 1951.

There being no objection, the comment was ordered to be printed in the RECORD, as follows:

Speech by Senator WILLIAM JENNER, of Indiana, opposing any increase in taxes should be read by every conservative businessman. It is on page 11940 of the CONGRESSIONAL RECORD for September 24. It is a long speech, full of solid meat, but probably failed to change a single vote on the bill.

JENNER hammered two themes. First was that Congress had lost its control of the purse strings of Government, historically the ultimate method by which parliaments curbed the usurpation of arbitrary power by executives. Only way to regain this essential power, he argued, was for Congress to quit providing funds for the administration.

The Indiana Senator's scathing description of the complete failure of the congressional drive for economy must have made some of his colleagues wince. He made the statement, unchallenged, that the only reason Congress voted \$60,000,000,000 for defense and \$8,000,000,000 for foreign aid was because the administration wanted it, not because Members were convinced it was necessary or that it was for the best interests of the American people.

JENNER's second theme was the failure of the Truman administration to achieve peace,

freedom or stability for the United States in the world despite expenditures which by the end of next year will total \$400 billion. Asking what the people had gotten for their \$400,000,000,000, JENNER contrasted our situation 7 years ago with today. Lands and people controlled by Russia have grown steadily and peace has receded over the horizon. In other words, JENNER contends the people have been bilked and he makes out a good case.

Senator JENNER seldom gets any press coverage, at least here in the eastern seaboard where most newspapers have swallowed State Department propaganda hook, line and sinker. He is a rabid nationalist who has opposed most of the Fair Deal's foreign-policy measures, which makes him a black reactionary isolationist among our intelligentsia.

Nevertheless, JENNER is one of the ablest orators in the Senate and his speeches pack a terrific wallop. Ex-Senator Tydings of Maryland was no slouch on the Senate floor, but JENNER made mincemeat of him during the fracas over the investigation of McCARTHY's charges against the State Department. Unfortunately, JENNER is disgusted with the Senate, intends to run for the GOP nomination for Governor in Indiana next year.

Housing for Families of Servicemen

EXTENSION OF REMARKS OF HON. STYLES BRIDGES OF NEW HAMPSHIRE

IN THE SENATE OF THE UNITED STATES
Tuesday, October 2, 1951

Mr. BRIDGES. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD two editorials, the first entitled "Not Mercenaries," from the Washington Daily News of September 24, 1951, the second entitled "The Rent Gougers," from the Washington Evening Star of September 29, 1951. They comment on the work of the Preparedness Subcommittee of the Senate Armed Services Committee, the subcommittee being under the chairmanship of the junior Senator from Texas [Mr. JOHNSON].

There being no objection, the editorials were ordered to be printed in the RECORD, as follows:

[From the Washington Daily News of September 24, 1951]

NOT MERCENARIES

The obligation of the American people to unite in moral support of our Armed Forces was the underlying theme of a Senate committee report today.

The Lyndon Johnson Subcommittee on Preparedness revealed its findings on the miserable housing for families of servicemen at 15 camps and posts. It was the committee's second such survey this year. In general, it found only slight improvement—widespread gouging and profiteering still going on, and service dependents living in chicken coops, barns, garages, and shacks.

But the committee had some wise and timely observations about American soldiers of today, and the way we treat them. These remarks probably were written by Senator JOHNSON himself, who has a knack of pointing up his committee reports with basic truths and sensible guidance.

The American soldier, it is noted, is not a mercenary. He is not a professional who makes a career out of killing his fellow men. He is first of all a citizen. And unless he feels the moral backing of his fellow citizens, he will lose the will to fight.

Total war involves whole populations—and total obligation. Which is to say, the whole-hearted support of the Nation's industry, its people and their common, unified will.

It is especially indicated, says the report, in the people's willingness to ease the lot of the men who go forth to do battle with the common foe.

Therefore, every case of rent-gouging, every instance of an American soldier forced to house his family in a hovel or chicken coop, represents a crack in the structure of national unity. Enough cracks could topple the whole structure. * * * A nation unable to unite behind its fighting men * * * is doomed.

The problem of housing—as well as the problem of providing needed blood for our Armed Forces—will finally be solved only by the sacrifice and devotion of individual Americans and their unanimous desire to contribute to the morale and peace of mind of our men in uniform.

[From the Washington Evening Star of September 29, 1951]

THE RENT GOUGERS

The latest report from Senator JOHNSON'S Armed Services subcommittee does not make pleasant reading. For it deals with a most reprehensible kind of exploitation—the gouging of servicemen and their dependents by greedy landlords.

This is the second report from the committee on this subject, and it takes note of some improvements. The armed services have been trying to alleviate the housing shortages. And in some areas—notably at Columbia, S. C., and Lake Charles, La.—the local communities have exerted themselves to provide decent housing at reasonable rentals.

The broad picture, however, is disgraceful. It is unreasonable to expect that good housing should always be available to servicemen and their families when a rapid expansion of the Armed Forces is under way. In many areas, where thousands of men suddenly are sent for training, there is little or no available housing. Nor can private sources be expected to provide such housing. Since private builders cannot know when military posts are going to be activated and deactivated—that is, when the need for housing for dependents will arise and when it will cease to exist—they cannot be expected to make a substantial investment in new construction.

This, however, does not in any way excuse the outrageous gouging that has been going on. In many of these suddenly congested areas chicken coops, tool sheds, and shacks of all kinds have been converted into housing for servicemen. Sanitary facilities generally are of the most primitive sort and utilities are grossly inadequate. If this were the best that could be provided, and if men called into the service nevertheless insisted on taking their dependents with them, they would have little basis for complaint if rentals were reasonable. But when landlords, and there are some servicemen among them, take advantage of the distressed situation to push the rent for these hovels to unconscionable heights, an entirely different situation is presented.

Senator JOHNSON'S committee has been well advised to expose these disgraceful conditions, and it should not ease up until everything possible has been done to restrain the chiselers and to provide, so far as possible, decent accommodations for the men who may be spending their last days with their wives and children.

Conservation for War or Peace, Drought Years or Wet—Part I

EXTENSION OF REMARKS

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the RECORD, I include the following address by H. H. Bennett, Chief, United States Soil Conservation Service, first annual KFBF Farm Field Day, Sedgwick County Soil Conservation District, Wichita, Kans., September 12, 1950.

CONSERVATION FOR WAR OR PEACE, DROUGHT YEARS OR WET

It gives me a great deal of satisfaction and encouragement to take part in this stimulating field day on the William Bertholf conservation farm out here in south-central Kansas, the heart of the Nation's Wheat Belt. It is gratifying to find the favorable crop prospects, after the dry weather which caused considerable concern in various localities earlier this year.

In fact, I should like to say a little more about this matter right at this point. I recently received a copy of an editorial from a Kansas newspaper which has been a consistent supporter of soil conservation, taking the Service to task for what the paper called "forecast" of a 1951 dust bowl. Now, I don't know what kind of stories were carried out here that were so disturbing (we have no clipping service); but I do know that neither I nor anybody else in the Soil Conservation Service has ever predicted another "dust bowl." Personally, I always have disliked even the term "dust bowl"; and the few times I use it I do so with quotation marks because it has been a widely used catch phrase, invented by I don't know whom and carried over from the 1930's. To me it is pretty much a matter of wind erosion, which I consider an unnecessary evil, although it may be years before the problem, which is rather more widespread than is commonly understood, extending even to the loose sandy lands of Wisconsin, New Jersey, Charleston, S. C., and many other places, is controlled.

NO DUST BOWL FORECASTS

What we did say, in summarizing late-June field reports last June 30, was this: Although the major threat of wind erosion damage was over for the time being, there were indications of continuing possibilities of trouble ahead for the drought-spotted areas unless rainfall picked up during the rest of the summer and farmers concentrated on their conservation cropping and other measures. That, as you know, was a simple statement of fact, in view of the months-long rainfall shortages and worst dust storms since the thirties in various localities during the spring and early summer. By the same token, possibilities of recurring drought likewise were greater than they had been at anytime since the 1930's.

Nobody rejoiced more, certainly, than we did in the Soil Conservation Service that the ink had hardly dried on the papers publishing this information when soaking rains brought relief to many of the previously drought-stricken sections—precisely in the manner mentioned in our Washington statement. We also felt mighty good, I can assure you, over the fact that southern and central plains farmers planted several million more acres of grain sorghums, sudan, and cover crops this summer than they usually plant,

because they were alert to the situation and set out to cope with it in the sensible conservation way. This, I am sure, was due in part to what was said about the possibilities.

CONSERVATION EFFECTIVENESS PROVED

I have made considerable point of this incident today, because what has happened in the southern and central Great Plains during the past year illustrates rather graphically the importance and the effectiveness of soil and moisture conservation farming, in dry years and wet. The pattern ran true consistently in the 1950 drought areas. Locally, there were soil blowing and poor crops, especially on land lacking any conservation treatment, and at least some kind of a crop or cover on adjacent conservation-farmed fields. And, from all reports, most of the area comprising the heart of the old so-called dust bowl weathered this year's drought in sound condition.

That was because farmers in the soil conservation districts there, where they were hit so hard in the 1930's, long since had come to the conclusion that you can't safely gamble with the weather, either in the Plains or other parts of the country where conditions favor wind erosion. The conservation farmer operates year in and year out so as to keep his land in the best possible condition to take what comes in the way of weather, from long dry spells to torrential rains. He uses stubble-mulch tillage, strip cropping, water-holding terraces, rotations of cover crops. On land unsuited to cultivation, he uses grass, which is a crop of steadily increasing importance throughout the country. Such methods constitute the best insurance he has against the vagaries of the elements and, short of a long period of unusually favorable rainfall such as blessed the Plains during and after World War II, are his best assurance of stable and profitable returns over the long run.

So, I believe you will agree with me that an important part of the legitimate job of the Soil Conservation Service, as the agency set up to meet your requests for technical conservation surveying, planning and treatment assistance, is to direct attention to whatever conditions that require positive conservation action. That is what we have always done, and shall continue to do when it appears such conservation uphugs may be helpful to all concerned.

CONSERVING PRODUCTIVE LAND VITAL TO AMERICAN ECONOMY

Also, in these days when our whole thinking and action must be directed at the preservation and free growth of true democracy in a world split by conflicting concepts of government or "ideologies," there is another important part of our public service job as conservation technicians, supervisors, or farmers. That is to drive home at every opportunity—by both word and action—that keeping our good land productive is vital to the productive strength of the American economy. As the President pointed out in his midyear economic report to Congress on July 26, this productive strength "is basic to our domestic well-being and our international security."

The one thing that is uppermost in everybody's mind today is mobilization of our manpower and economic resources for national security, come what may. Without a lasting agriculture, there can be no assurance of permanent prosperity, happiness, or peace anywhere on earth. A prosperous and lasting agriculture depends on an adequate supply of productive land, properly used and so protected from erosion that it will remain permanently productive. As long as people have enough productive land they can continue producing their food and fiber, and many of the raw materials of industry. If the land is neglected or unwisely used, the

certain consequences will be national weakness and decline. That has been the tragic result of many of the world's older agricultural areas.

Lasting soil conservation of the kind you are putting into effect here on the Bertholf farm, throughout the Sedgwick County soil-conservation district, and elsewhere in neighboring Kansas and Oklahoma counties, is mandatory everywhere. It is mandatory here in America, if our Nation—our civilization—is to avoid the undermining of the enemies of democracy, which appear to be girding themselves for new marches against our kind of government.

OUR WORLD LEADERSHIP RESTS ON THE LAND

None of us can say, of course, how long the present international emergency will last. Some people seem to think it will be short lived. Let us fervently hope it will be. Then there are those who take the other extreme view, that we may just as well count on being in a continuing state of emergency—hot and cold war—from the standpoint of defending our own and others' democratic life, for many years to come. We hope just as earnestly that such will not be the case; but, in any event, we must build and plan against any eventuality. It's no time either to experiment or take chances. And we don't need to—not with our productive land. We have learned how to take care of it, and part of that know-how is to keep on guard with eternal vigilance.

The United States definitely is in the position of world leadership, politically and economically, among the democracies, and naturally will be expected to retain that position with all the responsibility it involves. To do so, we must maintain our productive capacity, safeguarding our productive resources of land, water, timber, oil, minerals, and using them wisely.

We must maintain, first of all, the productive capacity of our land—which produces all but a very small part of our food, all of our timber, leather, and wool, all of our vegetable fibers and oils, tobacco, and many other essentials. This we must do regardless of whether peace or war lies ahead—or whether the weather smiles on us or plagues us with drought or flood or soil-drifting winds. Right now, those responsible for our national security are thinking in terms of greatly increasing our stockpiling of metals, drugs, and other raw materials. While doing these vitally important things, let's not forget that we cannot stockpile productive soil, in the sense of shipping it into this country from other countries. But we can and must safeguard our remaining productive land. This is an inseparable and essential part of our first line of national defense, because men with guns and bullets can't fight without food, and there can be little food from poor land. And what's left isn't any too much, although it's enough for a long time, if we take care of all of it—every acre.

CONSERVATION FARMING NOT JUST MATTER OF PASSING CONVENIENCE

Already, in the few short weeks since the Korean trouble started, threatened so-called surpluses of wheat and certain other farm commodities appear to have become comforting stores of essential food and fiber. When we have had repeated experiences of this nature, you wouldn't think anyone would be so foolish as to suggest that we sometimes don't need such things as soil conservation to help keep our agricultural producing plant in condition of top efficiency. Yet I am sure all of us have heard just such loose talk, both when there were a few extra bushels of wheat or other commodities in the granaries or when immediate demands for national defense or economic aid programs have been pressing and properly of first consideration.

We have been told, for example, that we shouldn't spend money on soil conservation in periods of ample crop production, because soil conservation farming increases yields. If that illogical line of reasoning—or nonsense—were carried to its ultimate conclusion, then we likewise wouldn't spend money on crops and livestock improvement, pest and disease control, or on any other agricultural research and improvement at such times. Instead, we would close shop—and mind—to foolishly take chances with whatever may come. The truth is that a maximum per-acre yields always are the basis of good agriculture, whether the market is up or down. Also, they mean the capacity of increased total production as may be needed.

Those who would have you abandon your conservation farming in wartime and other periods of maximum need for agricultural commodities are no less shortsighted. During World War II, conservation farming demonstrated its effectiveness, year after year, in giving maximum production of needed crops, with minimum labor and machinery wear and the most economical use of seed and fertilizer. Those are among the multiple benefits realized when the land is treated and used, acre by acre, according to its need and capability.

THE LONG-TIME NEED FOR SOIL CONSERVATION

Meanwhile—and again keeping in mind the long-time need as opposed to short-sighted land exploitation for the sake of imagined expediency—the kind of practical scientific conservation farming practiced in your own and more than 2,260 other soil-conservation districts over the country builds up a sound reserve of productive capacity. It keeps our powder dry. It is true that during the last war a considerable amount of land damage resulted from cropping to much land that should have been left in grass or in protective grass and legume rotation. But, even including the plowing up of hazardous lands in the drier areas of your own Great Plains for growing wheat, the over-all damage certainly was nowhere near what it might have been had we gone through the war and postwar farm production strain without benefit of any conservation farming knowledge and practice.

Other millions of acres, moreover—here in the Plains as elsewhere—were farmed under sound soil conservation practice for maximum, profitable production. This same land is in sound condition today to give maximum production next year and the next, as need may dictate. Every landowner or operator who has contributed to this favorable side of the record surely is to be commended and shall reap lasting rewards.

The practical flexibility of conservation farming becomes of increasing significance as we look ahead and think about our national well-being and security. Assuming that we shall not forever be faced with international emergencies, we still have to think about better living for our own growing population. That is, enough of the right kind of food—including, in addition to the essential cereal grains, ample amounts of meat, dairy, and poultry products—for everybody, for our children and our children's children. From this stable, peacetime viewpoint, the importance of soil and water conservation again is self-apparent, as the basis for sustained high-level production at relatively low cost.

With the population of the United States already having passed the 150,000,000 mark and the future population trend continually pointing upward, we have no productive land to spare if we look forward to a permanent high standard of living and national security. We have left in this country, as well as can be determined with available information, only about 460,000,000 acres of good,

productive cropland, including approximately 70,000,000 acres that would have to be cleared, irrigated, or drained before it could be cropped.

The main forces operating to reduce both the area of productive cropland and the productivity of cropland are soil erosion and unsound land use. Soil erosion is also the most damaging force affecting the Nation's range and pasture lands. On the other hand, the main forces operating to improve production from our croplands are soil and water conservation, improved plant varieties, insect and plant disease control, proper use of machinery. Of these, soil and water conservation is by far the most important, for the reasons I have explained. At this point, I think it might be well to consider for a moment what we mean when we talk about modern soil conservation like that which has brought us together here today.

Conservation for War or Peace, Drought Years or Wet—Part II

EXTENSION OF REMARKS OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave granted to extend my remarks in the RECORD, I include the following address by H. H. Bennett, Chief, United States Soil Conservation Service, first annual KFBI Farm Field Day, Sedgwick County Soil Conservation District, Wichita, Kans., September 12, 1950:

WHAT MODERN SOIL CONSERVATION IS

Modern soil conservation consists of the kind of sound land use and protection needed to keep the land permanently productive while in use.

It means contouring and terracing land that needs such treatment, and strip-cropping and stubble-cropping the land as needed, along with supporting practices of crop rotations, cover crops, green-manuring crops, etc., wherever needed. It means gully control; stabilizing water outlets; building farm and ranch ponds; locating farm roads and fences as nearly on the contour as practicable; planting steep, erodible land to grass or trees, development of good pastures, and devoting good management to them after they have been developed.

Where land is too wet, modern soil conservation calls, moreover, for drainage, with full consideration given to wildlife needs. If it is too dry, it calls for irrigation; if subject to wind erosion, it calls for wind-stripping, tree planting, growing cover crops, and stubble-mulch farming. If plant nutrients, lime and the humus supply of the soil have been depleted, it calls for fertilization and addition of lime and organic matter. If water-soluble salts have accumulated in toxic quantities, it calls for both drainage and leaching out of the "alkali" by flooding. And modern soil conservation calls also for the use of the best of the most adaptable varieties of crops as well as the most efficient of available adaptable tools.

Modern soil conservation likewise calls for flood control and reservoir protection (municipal, irrigation, etc.) by treatment of whole watersheds with the right combinations of practices, land use, and small structures in the smaller, upper watersheds where flood waters start. Applied at the right time

and place, such watershed treatment saves soil and reduces flood and sedimentation damage, stores water in the soil for plant use and, where conditions are favorable, in the underground strata for pumping.

And, of course, an indispensable part of modern soil conservation is a supporting program of research, such as will provide for the welfare of the land at all times, and give farmers and ranchers all the advantages that progressive science can contribute. Also, a continuing, vigorous program of soil conservation education should be made a part of our teaching from kindergarten on through college. And, modern soil conservation calls for the maintenance of all effective work, that has a chance for permanency. Such measures are not intended to be used for just a single year or cropping season. They are the basis of land permanency, and that is necessary if we are to have a permanent agriculture.

There is only one correct formula for doing the soil and water conservation job right—regardless of what anybody may try to tell you about single practices or other tempting short-cuts. That formula consists of treating the different kinds of land on a farm according to their individual needs, as determined by condition, and using each kind according to its capability for continued safe and economical production—whether that be for field crops, pasture, timber, or wildlife.

SOIL CONSERVATION DISTRICTS' PROGRESS

That is the kind of conservation farming you have been putting into effect with success and satisfaction here in the Sedgwick County soil conservation district since you began operations with technical assistance 5 years ago this month. It is the kind of conservation farming that is safeguarding and improving our country's farm and ranch lands at a progressively increasing rate each year—throughout Kansas, the Great Plains, and the Nation. In 1943, to illustrate, the Soil Conservation Service assisted the districts in completing 1 percent of the Nation-wide soil conservation job; but in 1949 the annual rate of progress went up to 2.3 percent of the unfinished job. We finished the job on 5,000,000 acres, approximately, in 1912 and on 22,000,000 acres last year. This was an increase of 340 percent, but we had an increase in facilities of only 43 percent.

When we reflect on the comparatively short time that soil conservation districts have been at the job—with the first one established in 1937—I think the progress that has been made is nothing short of remarkable. I mean both from the standpoint of district organization and soil and water conservation work actually done on the land in the districts. Admittedly, we still are not going fast enough, but it is at least encouraging that we are moving ahead at a progressively increasing rate. Do you realize that, as of the beginning of the present fiscal year (July 1, 1950) the districts covered 1,250,000,000 acres in the 48 States, Alaska, Hawaii, Puerto Rico, and the Virgin Islands, and that they included 4,750,000 farms and ranches? In fact, 80 percent of all our farms are now within district boundaries, as is three-fourths of the land in farms in the United States.

You in Kansas, in common with your neighbors in States like Oklahoma, Nebraska, Arkansas, and Texas, can be especially proud of your high place in the country's soil conservation districts column. With 103 of your 105 counties in districts as of August 1, I notice that almost 99 percent of all your land and 97½ percent of your farms were within soil conservation district boundaries. Today, you can travel from Wichita to the Gulf of Mexico, or in the opposite direction to the Canadian line, without ever getting outside of soil conservation districts. And I can come to Wichita

through the south Atlantic and Gulf States, and go back by way of Iowa, Illinois, West Virginia, etc., without getting out of districts.

SOIL CONSERVATION ACCOMPLISHMENTS SPEEDED UP

The districts' accomplishments in getting soil and water conservation on the land likewise are something to be proud of. Figures for the fiscal year to July 1, 1950, show how we have increased again the yearly rate of conservation surveying, planning, and treatment.

	Fiscal year 1950 1	Fiscal year 1949 1	Cumula- tive to July 1, 1950
Detailed conservation surveys made	31, 065, 000	25, 800, 000	134, 770, 000
Complete farm plans number	142, 750	115, 000	8, 000, 000
Acres planned	38, 700, 000	32, 200, 000	210, 000, 000
Acres treated	28, 000, 000	22, 000, 000	121, 000, 000

¹ Approximate total.

"I don't need to review for you your own noteworthy Kansas district accomplishments, with which you already are more familiar than I am anyway. I do want to say, however, that it was most pleasing to have Secretary Lawrence W. Rittenhouse of your Sedgwick County district's board of supervisors write me of the rapid strides he said soil conservation has been making in this part of the State. He said that of approximately 3,000 farms in this county, 888 already had soil conservation farm plans by June 30 this year, with nearly 300 additional applications approved and being carried out as rapidly as possible. Also, that Sedgwick County led all the counties in the State in the amount of conservation work in 1948 and 1949. I would say that you have every right to be proud of such a showing.

SOIL CONSERVATION DISTRICTS AND DEMOCRACY

Over and above such satisfying statistics of accomplishment, we cannot lose sight of the importance of your soil-conservation districts as living, working forces of practical democracy in action. The district organization, as it has stood the test of 13 years of peacetime and wartime experience under just about all possible economic, weather, and other conditions, definitely has proved itself to be superior to anything else we know about in coping with our basic land problems in a democratic fashion. Your districts are farmer voted and farmer managed. Between 11,000 and 12,000 soil conservation district supervisors are giving unselfishly of their time and energies in the furtherance of soil and water conservation work throughout the country. They are on nobody's payroll, and are obligated to no Federal or other outside authority.

In order to appreciate what this kind of democratic leadership means in the Nation's basic agricultural economy, really means in terms of what we mobilize and fight for when pressed to it by others, you need only to study the contrasting situation in so many other countries, where what the government says is law, with little or no opportunity for individual freedom of action, assurance of stability, or hope of security. I have observed these things in different parts of the world myself; and, of course, we read about them everyday. We can be eternally grateful that we enjoy an economy that depends on individual freedom and initiative, and the exercise of such individual responsibility as that which has been demonstrated by the scores of thousands of soil-conservation district landowners and operators like those of you in the Sedgwick County district.

Also, I am convinced that the district method would be the best approach that

farmers of the world everywhere could take for getting to the point where they have more voice in the affairs of their government and less discontent with the overlords. Bona fide soil conservation districts are in operation as going programs, I am happy to say, in several other countries—as the philosophy of conservation spreads faster world-wide. The more secure the individual, the more secure the community and the Nation. That is what makes the democracy we fight for.

THE PROFITABLENESS OF SOIL CONSERVATION

And certainly not least among the benefits of soil conservation farming to be considered when we think of national welfare and security is its profitableness. This kind of farming we see demonstrated here today on the Berthoff farm has been shown consistently to raise the individual landholder's income through more economical operations and greater per acre returns. This, in turn, is reflected in better business in town where the conservation farmer trades. And we also know that revenues to local, State, and Federal Governments are increased proportionately from such higher farmer earnings—revenues which pay for, among other things, jet bombers and bazookas. I could make an entire speech on this significant aspect of soil and water conservation, because the individual examples and other reported figures supporting these facts are too numerous ever to have been counted.

DIVERSIFICATION AND LIVESTOCK

Conservation farming, on the basis of following the complete conservation farm plans used by farmers and ranchers in soil-conservation districts, almost invariably calls for diversification of crops, often including more land in grass and trees. In this way, the economic stability of the farm operation is improved, and the farmer is in a better position to operate successfully in any kind of market. As I hardly need to remind this audience, the possibilities are good for increasing livestock production in this part of the country through such conservation farming. The experience of one Kansas livestock operator who stopped in at our Washington office recently is a ready illustration of what I am talking about.

He is Mr. Ben L. Robertson, of Emporia. I am sorry that I was out of town when he called, as I should like to have taken rather full notes from him on his success in fattening his beef cattle on bromegrass and lespedeza, and on the special Emporia Chamber of Commerce committee he heads to promote revegetation and other conservation farming. I understand, though, that Mr. Robertson reported getting 250 to 275 pounds of beef to the acre from his brome and lespedeza in a summer. Our fellows figured that out as a minimum of \$72.50 an acre return from this conservation crop, or anyway twice as much as from corn on the same kind of land, that is, class III and IV land. I feel sure that some of you here today would have similar experiences to report. And I am familiar with some of the things you have been doing out here in Kansas, such as development of improved grass strains like Auchenbach brome, the use of grass and legumes in crop rotations, and pure seed development and seed increase work.

NEED TO PUSH AHEAD WITH SOIL CONSERVATION JOB

The important thing for all of us to keep foremost in mind now, as always, is that we must push ahead as fast as we can, without sacrificing the lasting quality of the work we do, with our tremendous soil and water conservation job. As I said at the beginning, we don't know how long we may be faced with emergency conditions—possibly only a few weeks or months, maybe 25 years, although let us hope nothing like that will come to pass. But we do know that, emergency or no

emergency, we are determined to go forward as a democratic American people, enjoying the highest standards of living we may attain and keeping our national security intact at all times.

Your soil conservation districts have an important responsibility in all this, along with every business and other legitimate interest in this and every community. There is much we need to be thinking about, talking about, and doing something about to reach and hold our objectives. We have been making splendid progress in soil and water conservation; but the major part of the basic job is yet to be done. Especially we need to be on guard against and work to dispel certain misconceptions, or loose assertions, about soil conservation that still seem to confuse the thinking of some otherwise well informed people. Briefly stated, some of these are:

SOME MISCONCEPTIONS TO DISPEL

1 That soil conservation is of secondary importance, has already been taken care of, or can be postponed.

2 That there are short cuts to conservation, that farmers can do all the necessary conservation work without technical assistance, or that district farm plans are too technical for farmers.

3 That soil conservation costs more than it is worth.

4. That we have all the good land we need, and that soil erosion is an inevitable part of nature's scheme.

These "quibblings" are all so obviously wrong no further time will be devoted to them, merely to list them so you cannot be misled with a lot of nonsense.

SOIL CONSERVATION TAKES CONTINUED TEAMWORK BY ALL

The job we have to do calls for the closest teamwork of all interests in our society: farmers, business and professional people; private and public financial institutions, radio and television stations, newspapers and magazines, chambers of commerce and other civic organizations, sportsmen's, women's, young people's, and other groups; schools and churches; local, State, and Federal agriculture, forestry, and other agencies and farm organizations—everybody I know, as this Farm Field Day event so well demonstrates, that all these interests are working together here in the Sedgwick County soil-conservation district, as they are in districts all over the country.

A PROGRAM OF POSITIVE ACTION

To complete the soil- and water-conservation job in time calls for a program of positive action, in which all such groups have a natural interest. It includes, among other points: (1) Completion of the national land capability inventory at the earliest date facilities will permit, (2) completion of the organization of the Nation's agricultural lands into soil-conservation districts, and strengthening district responsibility and work—with a scientifically developed soil-conservation-district plan applied by a conservation farmer to every farm in the country at minimum public cost, (3) active participation of all interested rural and urban groups—business, professional, and patriotic—in achieving Nation-wide conservation; and (4) making a real conservationist of every farmer in the country.

I should like to quote briefly from a talk I prepared for the annual meeting of the Kansas Crop Improvement Association in Manhattan on February 2, this year, several months before the fighting broke out in Korea.

"Production of wheat to help feed the allied armies of two world wars has effectively demonstrated the capacity of Kansas land to fill the breach in time of critical national need. This Kansas land must be kept in good condition. It is basic to our welfare;

it cannot be spared. But drought and dust storms have shown us how nature can strike back when man takes the welfare of the land too much for granted and fails to protect it. So do gullies and stiff clay stripped of its topsoil. If we are to have the production we want when we need it, and if we are to avoid dust storms and gullies and dwindling yields on erosion-denuded slopes, we must look closely to the future and the kind of relationship that will have to be maintained between man and the land. Nationally and world-wide, conservation of the land from now on is one of the really urgent, basic problems of our time—probably the most urgent."

To which I wish to add at this time only this further thought: Conservation of our productive land, water, timber, wildlife, and other indispensable natural resources is not a matter which is of interest only to our own generation. It is the foremost factor on which hinges the very survival of all the generations to come after us. The safeguarding and perpetual wise use of these life-supporting resources is the only insurance we can have of continued national security for our free people in free America.

The Japanese Treaty

EXTENSION OF REMARKS

OF

HON. WILLIAM E. JENNER

OF INDIANA

IN THE SENATE OF THE UNITED STATES

Tuesday, October 2, 1951

Mr. JENNER. Mr. President, the New York Times for September 25, 1951, reports that the opposition leaders in the Japanese Diet are showing considerable resistance to the approval of the mutual aid treaty between the United States and Japan. They object because the Japanese Government has not yet published the details of the program so the Diet and the public can be fully informed.

They are protesting also an attempt by the Japanese Government to take over full control of the press and other information media.

I congratulate the members of the Japanese Diet on this adherence to the principles of representative government.

I ask unanimous consent to have printed in the RECORD certain paragraphs from the Times story.

There being no objection, the article was ordered to be printed in the RECORD, as follows:

FIGHT DUE IN JAPAN ON PACT WITH UNITED STATES—SECURITY TREATY'S RATIFICATION MAY BE HELD UP—MINORITY LEADERS VOICE CRITICISM

TOKYO, September 24—Difficulties here began to arise over ratification of the security agreement between Japan and the United States that followed the signing of the peace treaty at San Francisco.

Some political circles now express the opinion that the agreement to keep a United States armed garrison here, even after the nation becomes officially sovereign and independent will not be approved by next month's session of the Diet.

The expressed opinions of leaders of minority parties now seemed to indicate that

there was considerably harder sledding ahead for the defense agreement than was expected by Premier Shigeru Yoshida at San Francisco.

QUESTIONS OVER TERMS

The Democrats and Socialists, according to intimations, particularly want to know specifically what facilities and what powers will be granted to the United States defense forces, what the costs will be, and whether or not there is a time limit or limitation on the foreign garrisoning of independent Japan before they are willing to endorse a blanket agreement.

The question of ratification of the security pact has come up in connection with the Government's proposal to hold a special session of the Diet next month specifically to endorse the peace treaty but also to act on the internal laws and external arrangements Japan presumably will have to possess when she again becomes a sovereign state.

The sessions are tentatively expected to open October 10. Some Government plans already are encountering considerable opposition and informed quarters consider it probable that much of the program will have to go over until the next regular session scheduled between December 5 and the Christmas holidays.

The principal point raised by the opposition leaders in regard to the security pact is that, though many detailed negotiations would be required to determine just what Japan would grant or withhold, no details had been published by the Yoshida Government concerning what it had in mind.

GOVERNMENT PUTS PACT FIRST

The Government's attitude is that the agreement should first be ratified by the Diet and the conditions later fixed by a bilateral agreement between the Japanese and United States administrations. This is not too popular with nongovernmental parties.

A typical comment came from Inejiro Asanuma, chief secretary of the Socialist Party—generally opposed to the treaty as a whole. Mr. Asanuma said that while the security arrangement was not a special target of the Socialists "I can't understand why the Government wants to conclude the pact even before the treaty itself is ratified."

This is also approximately the feeling of the usually conservative Democratic Party. Takeo Mikki, the party's organizational leader, also expressed the opinion that since the "garrisoning of foreign troops requires true and close collaboration between the troops and the Japanese people," the public here should be better informed on what is expected before their Diet representatives are required to ratify the pact.

A second argument already has arisen over the Yoshida administration's proposed internal state security bill, which in its tentative form would have passed on to the Government many of the powers possessed by the occupation—including press control, a measure that would have permitted bureaucracy, despite all constitutional provisions, completely supervise all information media and even close them down on the vaguest of accusations.

ORIGINAL PROPOSAL SWEEPING

The original proposal was to enact into law the occupation's press code—a military measure put into effect in 1945—which allowed headquarters to punish newspapers and other publications for failure to adhere to what it deemed to be "truth" or for the publication of anything supposed to be troublesome to public peace.

After a bitter complaint by the Japanese Editors and Publishers Association, Attorney General Takeo Ahashi announced yesterday the Government now has decided to abandon this plan, at least temporarily.

Secrecy in Government**EXTENSION OF REMARKS**

OF

HON. JOHN W. BRICKER

OF OHIO

IN THE SENATE OF THE UNITED STATES

Tuesday, October 2, 1951

Mr. BRICKER. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD an article entitled "Secrecy Called Peril to Press," which appeared yesterday in the Washington Daily News.

There being no objection, the article was ordered to be printed in the RECORD, as follows:

SECURITY CALLED PERIL TO PRESS

CHICAGO, October 1.—Newspaper executives from 43 of the country's leading publications warned yesterday "secrecy in Government" imperils United States freedom of the press.

The editors and publishers met in an all-day session with Dr. Alberto Gainza Paz, editor and publisher of the expropriated Argentine newspaper La Prensa.

An honorary degree in journalism will be conferred on Dr. Gainza later today at a special convocation at Northwestern University.

The warning by the newsmen was embodied in a declaration which charged that public information is being steadily undermined by the growing practice of secrecy in government.

SECURITY CODES

The newsmen swung hard at President Truman's order last week setting up "security codes" of censorship of governmental news.

They said there is a feeling among Government officials that they can "extend military security into areas of news which have no bearing on the Nation's security, as shown in an Executive order issued within the week."

The discussion was held at Northwestern and was sponsored by the school's Medical School of Journalism and the Inter-American Press Association.

A WARNING

Dr. Gainza warned that La Prensa's fate could be the fate of any newspaper.

Argentina had a long history of democratic tradition, he said. But in 1941 a "state of siege" was declared in connection with World War II.

Two years later, the leaders of the military coup found it easy to suppress additional information because the press was already controlled.

SIEGE STARTED IT

"I think that what happened in Argentina happened only because of the previous state of siege," Dr. Gainza said. "It would have been impossible without that."

Several American newsmen remarked that the present security measures now being imposed in this country because of the defense effort, with the resulting curtailment of news at the source, are similar to the Argentina state of siege of 1941.

ECONOMIC GROUP ISSUES WARNING AGAINST SECRECY

The Committee for Economic Development, a nonpolitical organization of widely known businessmen and educators, has just dropped a warning into the general discussion of the Government's trend toward secrecy and censorship.

The Government, the committee said, "is following a much more comprehensive pro-

gram of secrecy than in any previous period when we were not at war. Moreover, our people have been cut off from important information through censorship, both formal and informal, by foreign governments. To an unprecedented degree the public is depending for its foreign intelligence upon what our own Government agencies decide to disclose."

The committee findings, by its research and policy committee, were published in December 1949, after a study of 18 months. Apparently the committee feels that the secrecy situation is working out in the dangerous way it forecast because it notes that "this whole problem was anticipated." It is recirculating the brochure it issued nearly 2 years ago.

The Cases of Senator McCarthy and the Late Senator La Follette, Sr.**EXTENSION OF REMARKS**

OF

HON. STYLES BRIDGES

OF NEW HAMPSHIRE

IN THE SENATE OF THE UNITED STATES

Tuesday, October 2, 1951

Mr. BRIDGES. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD an article entitled "McCarthy Recalls La Follette Incident," written by David Lawrence and published in the Boston Traveler of October 1, 1951.

There being no objection, the article was ordered to be printed in the RECORD, as follows:

MCCARTHY RECALLS LA FOLLETTE INCIDENT

(By David Lawrence)

WASHINGTON—This is a tale about a Wisconsin Senator—a Republican. He made speeches inside and outside the Senate which angered the people of his own State and the people of the Nation.

The unpopularity of this Senator was such that newspapers from one end of the country to the other denounced him, not only for his tactless way of bludgeoning his adversaries and his vocabulary of anathema, but for treasonable and seditious utterances.

The Republican State Central Committee of Wisconsin by unanimous vote demanded his expulsion from the United States Senate for treasonable and seditious utterances. The League of Wisconsin municipalities took the same action. The State council of defense and 71 county councils called on him to resign and demanded that the United States Senate expel him if he didn't resign. He was hanged in effigy.

Rotary groups, bar associations, public-safety committees in his own State and elsewhere denounced him. The Republican State Convention of Massachusetts adopted a resolution censuring him for marked disloyalty. Former President Theodore Roosevelt called him the most sinister enemy of democracy in the United States and called for his expulsion from the Senate.

The same Wisconsin Senator then made a bitter speech in St. Paul, Minn. There was some doubt afterward as to exactly what the Senator said. The furor caused the United States Senate to appoint a special committee to investigate the demands for expulsion. The chairman of that committee—a Democratic Senator—construed the committee's powers as limited to ascertaining first, the truth or falsity of what the Senator said and second, the truth or falsity of his statement of facts. The issue was debated at length

in the Senate. Senator Kellogg, of Minnesota, Republican, a great lawyer of his day, who later became a Secretary of State, refused to admit that the issue of free speech was at stake. He said "This is a question of erroneous statement of facts rather than of free speech."

The Wisconsin Senator had denounced the motives of the United States Government. He questioned the sincerity of its acts at a time when its troops were fighting on the battlefield. Only from a few places did endorsement of his stand come. The California Federation of Labor, for instance, expressed confidence in him as a true American citizen and upheld his right to voice the views of an intelligent man.

Then after the war, the same Wisconsin Senator was reelected by the people of Wisconsin and remained in the Senate for many years afterward, often fighting in behalf of unpopular causes. So great was his hold on the people of his State that his son—a very able man in his own right—was elected to the Senate as his successor without being in the slightest degree damaged politically by the controversy in which his father had been engaged. Indeed, the father ran for the Presidency of the United States as an independent in 1924 and polled close to 5,000,000 votes. No third-party candidate since then has obtained as many.

The name of the Senator from Wisconsin for whose expulsion there was such widespread demand was Robert M. La Follette.

What did history say 34 years later? A President of the United States—a Democrat—in speaking to a Nation-wide radio audience on July 28, 1951, denounced, by implication, a present-day United States Senator from Wisconsin and spoke of Wisconsin as "The home State of two of America's greatest liberal and progressive Senators, Robert M. La Follette and Robert, junior."

This tribute of greatness was given to a man once widely denounced. It will be argued, of course, that the cases of Senators McCarthy and La Follette are not parallel because the one smeared individuals and the other smeared his own Government or because one allegedly engaged in improper campaigning and the other did not. It makes one wonder how many people in America, inside and outside public life who profess to be liberals, sincerely subscribe to the doctrine laid down by the late Justice Oliver Wendell Holmes, of the Supreme Court of the United States, who once defined freedom of speech as freedom for the thought we hate.

The Controls Issue**EXTENSION OF REMARKS**

OF

HON. HOMER E. CAPEHART

OF INDIANA

IN THE SENATE OF THE UNITED STATES

Tuesday, October 2, 1951

Mr. CAPEHART. Mr. President, I ask unanimous consent to have printed in the Appendix of the RECORD an editorial entitled "By Default," published in the Dallas Morning News of Monday, September 24, 1951.

There being no objection, the editorial was ordered to be printed in the RECORD, as follows:

BY DEFAULT

The News would be remiss not to acknowledge the readiness with which Indiana's Senator HOMER CAPEHART expressed

personal willingness to appear on a TV debate with President Truman on the nature and effects of the whole control bill, with no coaching. The President had publicized his letter to CAPPHART in which he stated boldly that the Senator did not understand his own amendment to the bill. The News, skeptical that Mr. Truman understands the bill, suggested that the TV debate would be a fair test.

Mr. Truman being silent, presumably the Senator wins by default. Only there is no prize in victory. It would be a great contribution to government if our American Presidents, who customarily speak without anybody being able to challenge, would appear and answer questions. But they will not do so.

The presidency is political capital. The President has a canned speech written for him, delivers it. His party could put up somebody who knows what it is all about to do the talking but the somebody would be just another person.

How many times did you ever listen to Senator Harry Truman? Or put faith in what he said?

Good Economics

EXTENSION OF REMARKS

OF

HON. OVERTON BROOKS

OF LOUISIANA

IN THE HOUSE OF REPRESENTATIVES

Monday, October 1, 1951

Mr. BROOKS Mr. Speaker, the cotton farmers responded to an appeal by the Federal Government last year to produce a bumper crop in order to meet defense needs. Acting in good faith, the cotton farmer increased his production and is now threatened by sharp price decline.

Under leave to extend my remarks in the RECORD, I offer for inclusion a timely discussion of the problem of the cotton farmer which appeared in the Louisiana Farm Bureau News:

COTTON MARKET MUST BE STABILIZED

As a simple matter of good economics and good faith the Government should carry out the cotton price stabilization recommendations made by the Farm Bureau and by others interested in the welfare of agriculture and in fair treatment for agriculture. Such action is necessary if cotton growers are not to suffer severely as their only reward for having answered the Government's appeal for a bumper crop in 1951.

As a result of the efforts of the cotton growers to produce this bumper crop, cotton prices have broken sharply. At the same time labor has become more scarce, and the price of what the farmers must buy to produce their bumper crop has gone up. Cotton growers are being squeezed between low prices and high costs, and little or no profit can be made at the harvest season prices now in prospect.

The proper level at which to stabilize prices for the 1951 crop is the level prevailing at planting time. The Government has the means readily at hand to do so. A cotton stockpiling program would assure cotton farmers a fair price and would protect the country against ever again being caught short of one of the most important of all war materials.

By helping friendly countries meet their cotton needs from the bumper American crop the Government can go a long way toward preventing a burdensome surplus.

By stabilizing the price of cotton at a reasonable level the Government can keep faith with cotton growers and let them know that should any other such emergency arise in the future they can respond without fear of bringing disastrous losses on themselves.

Are We Really Better Off?

EXTENSION OF REMARKS

OF

HON. T. MILLET HAND

OF NEW JERSEY

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. HAND. Mr. Speaker, because I feel that a recent editorial in the Millville (N. J.) Daily Republican is worthy of the attention of the entire House, I have sought and obtained permission to include it in the CONGRESSIONAL RECORD. The article follows:

President Truman in defending his unprecedented spending and his administration's policies, says we are better off than ever before.

The answer to that is we should be!

Why shouldn't we be better off? There have been new products, improved products and new processes, improved processes.

The President made comparisons of the present with 1939. It would be just as logical to say that 1939 was better than 1839 or 1869. It should be.

Economically and financially we are better off. But is the country better off with its huge debt that defies liquidation.

Furthermore the real question is, right now wouldn't we be even better off than President Truman says we are, if we had not had inflation.

Mr. Truman also refers to the predictions of financial disaster. He claims such dire prophecies have been made for several years and have failed to come true. What of that?

The answer is not a complex one. It is answered by a question: How much inflation can we stand?

Now we have a 50 cent dollar. When will we have a 25 cent or a 15 cent dollar?

We all know that when the dollar has no value we are sure in a mess. We are certain to have disaster. But at what point between the 50 cent dollar and the valueless dollar is the breaking point?

It is just as sure as Mr. Truman said it that people are better off. But think of how much better off all of us would be if we did not have so much to pay in taxes. President Truman did not mention the fact that the price of government has advanced a great deal more than the price of food.

On the basis of proposed spending one of two things must happen—or some of both. Either we must raise a lot more money in taxes or there must be a lot more borrowing. And that's not butterfly outment, either.

The President says the budget cannot be cut for it is tight and as solid as we can make it.

But Senator BRAD points out that nondefense expenditures in 1948 were \$6,000,000,000. Yet in 1951-52, when we should be retrenching on nondefense spending, the corresponding figure is almost \$10,000,000,000.

If the President feels that some of his critics are using "butterfly statistics," we would suggest that he study the comment of the New York Times on some of his own statistics. It is:

"Paradoxically, however, it is Mr. Truman himself who has produced (quite inadver-

tently) the most devastating indictment of the fiscal policies of his own administration. While nondefense expenditures have gone up 68 percent in the past 10 years, he is reported as saying, they actually declined when one takes into account adjustments for changes in the price level. Precisely. Since Mr. Truman himself took office in April 1945, the cost of living has risen approximately 46 percent and the cost of food nearly 67 percent.

"Are we to believe that this phenomenon has no relation to the Government's policy of steadily blowing up the economy by pumping out purchasing power? And the policy of perpetually easy money advocated by the President's Council of Economic Advisers and maintained throughout Mr. Truman's administration by his own fiscal authorities over the protest of the Federal Reserve—are we to believe that this has not been an essential element in the administration's basic policy of what it likes to refer to as expansionism, but which many would say was simply calculated, deliberate inflation?"

Everybody Shares Soil and Water Conservation Awards—Part I

EXTENSION OF REMARKS

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the RECORD, I include part I of the address by H. H. Bennett, Chief, United States Soil Conservation Service, before the Denver Post Station KLZ soil conservation recognition banquet, Julesburg, Colo., September 25, 1950:

EVERYBODY SHARES SOIL AND WATER CONSERVATION AWARDS

All of us can take personal satisfaction in joining in these recognition ceremonies for your northeastern Colorado winners in the soil-conservation recognition program sponsored by the Denver Post and radio station KLZ. Although the physical awards to be presented necessarily cannot be numerous, the actual rewards of soil and water conservation accomplishment are so many and so substantial that there are enough to go around for everybody.

In other words, presentation of these awards this evening for outstanding accomplishment in soil conservation farming is symbolic of the rewarding nature of soil and water conservation wherever it is practiced. The rewards from conservation and wise use of the land are by no means limited to the farms and ranches on which conservation programs are used. They extend to our whole society, to the profit and satisfaction and well-being of everybody. They mean more sound soil conservation on the land, according to kind and need.

Some of these rewards are:

1. To landowners and operators—increased income, better living, greater security for the future.

2. To the community—better business, improved schools, churches, roads, and other community essentials; and people working more closely together as a result of a thriving agriculture.

3. To the public in general—protection of the land on which we depend for virtually all of our food and much of our clothing; and all of our wood, vegetable oils and fats, tobacco, etc., together with reduction of

floods and siltation of streams and reservoirs.

4. To government (local, State, and Federal)—increased revenues resulting from increased earnings and added wealth from land stabilized and improved through conservation farming.

One of the principal tasks we face as soil conservationists and friends of conservation is getting everybody to know about these generous and continuing returns from conservation farming. That is in addition to, but right along with, the job of putting conservation on every possible acre of land just as fast as we can. It would be hard to overestimate the value of this soil conservation recognition program and the other constructive, day-by-day efforts made by the Post and KLZ for a number of years to further the progress of conservation farming in Colorado and the surrounding territory.

Back in December 1947 when this conservation awards program was just getting under way, I wrote Publisher Palmer Hoyt: "Your enterprise in taking this means to focus attention on the important matter of conserving our soil and water resources represents a real public service. Such a contest unquestionably will be highly effective in stimulating conservation thinking and action throughout Colorado as well as over a wider area." I am happy that events have borne out that statement. When I was out here in Colorado a few weeks ago, various people—including soil conservation district supervisors and some of our own Soil Conservation Service personnel—told me they had learned more about the progress of soil conservation in the State by reason of serving on the awards program teams than they ever had in any other way. I can understand how they feel; because I have visited some of the winning farms and ranches and talked with winning farmers myself. No one can see this work and talk with these conservation farmers without being impressed, and inspired to redouble his own efforts for furtherance of conservation.

Such positive attention to the vital task of safeguarding our basic soil and water resources is especially important at this time. So many sober activities are occupying everybody's attention that the temptation might arise to allow ourselves to be distracted somewhat from such a fundamental element as this is in our whole national well-being and security. You and I know that we can't afford to let that happen, but such understanding among ourselves as practicing soil conservationists—whether as farmers or otherwise—is not enough. Every man, woman, and child who produces, handles, processes, or consumes the products of the soil likewise must have this conservation concept before we can have any lasting assurance that the good land which is the very base of our democracy shall be permanently maintained to meet our utmost needs in time of peace or war.

Without a lasting agriculture—the kind of agriculture which soil conservation districts exist to perpetuate—there can be no assurance of permanent prosperity, happiness, or peace anywhere on earth. And a prosperous and lasting agriculture depends on an adequate supply of productive land properly used and so protected from erosion that it will remain permanently productive. What's the use of applying the permanent type of soil-stabilizing measures and then permit them to go to pieces for lack of maintenance.

Lasting soil conservation of the kind you are putting into effect here in the Sedgwick County soil-conservation district and in the other Colorado districts, with the technical assistance of the Soil Conservation Service, is mandatory everywhere. It is mandatory here in the United States if we are to avoid national weakening, while the enemies of democracy cry out against us. None of us can say, of course, how long the present

international emergency will last. But the strain on our land which we now again face may be prolonged, and we must build and plan against any eventuality. This is no time either to experiment or take chances. And we don't need to—not with our productive land and other resources of water, timber, oil, and minerals, wisely used.

Productive land is an inseparable and essential part of our first line of national defense; because men with guns and bullets can't fight without food, and there can be little food from poor land. Already since the Korean trouble started, threatened so-called surpluses of certain farm commodities appear to have become comforting stores of essential food and fiber. When we have had repeated experiences of this nature, you wouldn't think anyone would be so foolish as to suggest that we sometimes don't need such things as soil conservation to help keep our agricultural producing plant in condition of top efficiency. Yet I am sure all of us have heard just such loose talk.

During World War II, conservation farming demonstrated its effectiveness, year after year, in giving maximum production of needed crops, with minimum labor and machinery wear, together with the most economical use of seed and fertilizer. Those are among the multiple rewards of treating and using our productive land according to sound conservation practices. It also builds up a sound reserve of productive capacity—keeps our powder dry! We all know that during the last war a considerable amount of land damage resulted from cropping too much land that should have been left in grass or in protective rotations. But the damage was nowhere near what it might have been had we gone through the war and postwar farm production strain without benefit of any conservation farming knowledge and practice.

Other millions of acres, moreover—out here in the Great Plains as elsewhere—were farmed under sound soil conservation practices for maximum, profitable production. This same land is in sound condition today—even in the heart of the old so-called Dust Bowl area—to give maximum production next year and the next, as need may dictate. Such methods constitute the best insurance the farmer has against the vagaries of the elements and, short of a long period of unusually favorable rainfall, are his best assurance of stable and profitable returns over the long run.

Before looking further at some of the remarkable progress we have made in soil and water conservation in the last few years, and at the tremendous job which still lies ahead of us, I think it might be well to consider for a moment what we mean when we talk about modern soil conservation like that which has brought us together here this evening.

Modern soil conservation consists of the kind of sound land use and protection needed to keep the land permanently productive while in use.

It means contouring and terracing land that needs such treatment, and strip-cropping and stubble-mulching the land as needed, along with supporting practices of crop rotations, cover crops, green-manuring crops, etc., wherever needed. It means gully control, stabilizing water outlets; building farm and ranch ponds, locating farm roads and fences as nearly on the contour as practicable; planting steep, erodible land to grass or trees; development of good pastures and devoting good management to them after they have been developed.

Where land is too wet, modern soil conservation calls, moreover, for drainage, with full consideration given to wildlife needs. If it is too dry, it calls for irrigation; if subject to wind erosion, it calls for wind-stripping, tree planting, growing cover crops, and stubble-mulch farming. If plant nu-

trients, lime, and the humus supply of the soil have been depleted, it calls for fertilization and addition of lime and organic matter. If water-soluble salts have accumulated in toxic quantities, it calls for both drainage and leaching out of the alkali by flooding. And modern soil conservation calls also for the use of the best of the most adaptable tools.

Modern soil conservation likewise calls for flood control and reservoir protection (municipal, irrigation, etc.) by treatment of whole watersheds with the right combinations of practices, land use, and small structures in the smaller, upper watersheds where floodwaters start. Applied at the right time and place, such watershed treatment saves soil and reduces flood and sedimentation damage, stores water in the soil for plant use and, where conditions are favorable, in the underground strata for pumping.

And, of course, an indispensable part of modern soil conservation is a supporting program of research, such as will provide for the welfare of the land at all times, and give farmers all the advantages that progressive science can contribute. Also, a continuing, vigorous program of soil conservation education should be made a part of our teaching from kindergarten on through college. And modern soil conservation calls for the maintenance of all effective work that has a chance for permanency. Such measures are not intended to be used for just a single year or cropping season. They are the basis of land permanency, and that is necessary if we are to have a permanent agriculture.

There is one correct formula for doing the soil and water conservation job right. It certainly can't be done right with single practices or with time-consuming, inadequate short-cuts. That formula consists of treating the different kinds of land on a farm according to their individual needs as determined by such conditions as degree of erosion, waterlogging, etc., and using each kind according to its capacity for continued safe and economical production—whether that be for field crops, pasture, timber, or wildlife.

You Colorado soil conservation district farmers appreciate what I am talking about in this respect, I am sure. The very fact that some of you are being honored here this evening attests to the fact that you have tried and proved the effectiveness of thoroughgoing soil and water conservation, comprising basic land capability surveys, completely coordinated conservation plans for whole farms, and the careful application of the conservation measures called for, with expert technical assistance. This is the kind of conservation farming that is safeguarding and improving our country's farm lands at a progressively increasing rate each year—throughout Colorado and the Nation.

While we admittedly are not moving fast enough and are still suffering heavy losses of soil, we are, nevertheless, moving ahead at an encouraging rate. In 1943, to illustrate, the Soil Conservation Service assisted the districts in completing 1 percent of the Nation-wide soil conservation job; but in 1949 the annual rate of progress went up to 2.3 percent of the unfinished job. We finished the job on 5,000,000 acres, approximately, in 1942 and on 22,000,000 acres in 1949. This was an increase of 340 percent, but we had an increase in facilities of only 43 percent. And in the fiscal year ending June 30, 1950, the acreage treated with needed conservation measures in the districts jumped to 26,000,000 acres. By these figures, you can see that the conservation job not only is progressing but is doing so at an accelerated rate, considerably out of proportion to the facilities.

Here are some of the figures for the last fiscal year, which show how we have increased

again the yearly rate of conservation surveying, planning, and treatment all down the line:

	Fiscal year 1950	Fiscal year 1949	Cumulative to July 1, 1950
Detailed conservation surveys.....	31,465,000	25,800,000	334,770,000
Complete farm plans number.....	142,790	115,000	870,000
Acres planned.....	38,700,000	32,290,000	240,000,000
Acres treated.....	20,000,000	22,000,000	121,000,000

Our books, up to June 30, 1950, show that 18.6 percent of the conservation job had been completed. In addition, there had been a considerable spread of practices to thousands of farms, both inside and outside of soil-conservation districts, for which we have no records. If we can raise the annual rate of application of effective conservation measures a little more, which we can do with adequate facilities, we can begin to see the goal—the possibility of finishing the job on time. This would mean completing the basic conservation surveying, planning, and treatment of the land with the basic conservation measures needed during the next 20 years, or by about 1970. After that, of course, would remain the continuing job of maintenance and improvement of the conservation work as a result of research and other improvements which will continue to develop. Soil conservation, like any other works of man, must be maintained, to avoid disappearing through neglect. And the land is entitled to all the continuing benefits that may be derived from research and experience.

As a step in the continuing effort to reach the goal on time, we are urging the completion of at least an average of 4 percent of the job annually during the coming 3-year period. Nationally, this would mean an average annual rate of around 60,000,000 acres inventoried (surveys), 50,000,000 acres of farm land planned for conservation, and 40,000,000 acres treated each year during the fiscal years of 1952 to 1954, inclusive. I am more confident now than I have ever been before that we can attain this goal if the requisite technical facilities are available.

This confidence in what we can do as a Nation in safeguarding our remaining land resources—and putting to best use the water which makes the land produce—is based in major part on the existence and active operation of your soil-conservation districts. After all, how and when we get this job done is up to those who own and operate the land, and that means, for all practical purposes, that it is up to the farmers and ranchers in soil-conservation districts.

Should anyone doubt the accuracy of this conclusion, let me remind such persons that, as of July 1, this year, 80 percent of all our farms and three-fourths of all the land in farms in the United States were within soil conservation district boundaries. Farmers over the country are voting new districts into being every month under their State enabling laws, so that it is not unreasonable to assume that before too long a time the farm land of the Nation will all be in districts. Although the first soil-conservation district anywhere was established no longer ago than 1937, they now number 2,268 and cover 1,230,000,000 acres in the 48 States, Alaska, Hawaii, Puerto Rico, and the Virgin Islands.

I notice that, as of August 1, this year, 72 percent of the farms in Colorado and 56 percent of your farm land were within this State's 89 districts, in 53 of your 63 counties. I hope that your fellow Colorado landholders will see fit to drive ahead to place this State in the 100-percent district-covered column, along with neighboring Nebraska and many

other States which are either completely covered by districts or are very largely covered. Do you realize that today you can travel from Julesburg to the Gulf of Mexico, or in the opposite direction to the Canadian line, without ever getting outside of soil-conservation districts? And I can come to Julesburg through the South Atlantic and Gulf States and go back by way of Iowa, Illinois, West Virginia, etc., without getting outside of soil-conservation districts.

These statistics of district organization and accomplishments are satisfying, of course; but your soil-conservation districts possess another quality which in my opinion is most significant to keep in mind in these trying times. I am referring to the districts as living, working forces of practical democracy in action. The district organization, as it has stood the test of 13 years of peacetime and wartime experience under just about all possible economic, weather, and other conditions, definitely has proved itself to be superior to anything else we know about in coping with our basic land problems in a democratic fashion. Your districts are farmer voted and farmer managed. Between 11,000 and 12,000 soil-conservation district supervisors are giving unselfishly of their time and energies in the furtherance of soil- and water-conservation work throughout the country. They are on nobody's payroll, and are obligated to no Federal or other outside authority.

Everybody Shares Soil and Water Conservation Awards—Part II

EXTENSION OF REMARKS

OF

HON. VICTOR WICKERSHAM

OF OKLAHOMA

IN THE HOUSE OF REPRESENTATIVES

Tuesday, October 2, 1951

Mr. WICKERSHAM. Mr. Speaker, under leave to extend my remarks in the Record, I include part II of the address by H. H. Bennett, Chief, United States Soil Conservation Service, before the Denver Post Station KLZ soil conservation recognition banquet, Julesburg, Colo., September 25, 1950:

The soil-conservation district movement, in my opinion, is the greatest movement relating to the welfare of the land in all history.

It is important to mention, also, I think, the some 20,000 natural neighbor groups in soil conservation districts with which we in the Soil Conservation Service are cooperating in getting this important job done. We can be eternally grateful that we enjoy in this country an economy that depends on individual freedom and initiative, and the exercise of such individual responsibility as that which has been demonstrated by the scores of thousands of soil conservation district landowners and operators like those of you in the Sedgwick County district.
